The temporal structure of human existence, according to Mead, can be described in terms of the concepts of *emergence*, *sociality*, and *freedom*.

Emergence and Temporality

What is the ground of the temporality of human experience? Temporal structure, according to Mead, arises with the appearance of novel or "emergent" events in experience. The emergent event is an unexpected disruption of continuity, an inhibition of passage. The emergent, in other words, constitutes a problem for human action, a problem *to be* overcome. The emergent event, which arises in a present, establishes a barrier between present and future; emergence is an inhibition of (individual and collective) conduct, a disharmony that projects experience into a *distant* future in which harmony may be re-instituted. The initial temporal structure of human time-consciousness lies in the separation of present and future by the emergent event. The actor, blocked in his activity, confronts the emergent problem in his present and looks to the future as the field of potential resolution of conflict. The future is a temporally, and frequently spatially, distant realm to be reached through intelligent action. Human action is action-in-time.

Mead argues out that, without inhibition of activity and without the distance created by the inhibition, there can be no experience of time. Further, Mead believes that, without the rupture of continuity, there can be no experience at all. Experience presupposes change as well as permanence. Without disruption, "there would be merely the passage of events" (*The Philosophy of the Act* 346), and mere passage does not constitute change. Passage is pure continuity without interruption (a phenomenon of which humans, with the possible exception of a few mystics, have precious little experience). Change arises with a departure from continuity. Change does not, however, involve the total obliteration of continuity -- there must be a "persisting non-passing content" against which an emergent event is experienced as a change (*The Philosophy of the Act* 330-331).

Experience begins with the problematic. Continuity itself cannot be experienced unless it is broken; that is, continuity is not an object of awareness unless it becomes problematic, and continuity becomes problematic as a result of the emergence of discontinuous events. Hence, continuity and discontinuity (emergence) are not contradictories, but dialectical polarities (mutually dependent levels of reality) that

generate experience itself. "The now is contrasted with a then and implies that a background which is irrelevant to the difference between them has been secured within which the now and the then may appear. There must be banks within which the stream of time may flow" (*The Philosophy of the Act* 161).

Emergence, then, is a fundamental condition of experience, and the experience of the emergent is the experience of temporality. Emergence sunders present and future and is thereby an occasion for action. Action, moreover, occurs *in time*; the human act is infected with time -- it *aims* at the future. Human action is teleological. Discontinuity, therefore, and not continuity (in the sense of mere duration or passage), is the foundation of time-experience (and of experience itself). The emergent event constitutes time, i.e., creates the necessity of time.

[Return to Section Headings]

The Function of the Past in Human Experience

The emergent event is not only a problem for ongoing activity: it also constitutes a problem for rationality. Reason, according to Mead, is the search for causal continuity in experience and, in fact, must presuppose such continuity in its attempt to construct a coherent account of reality. Reason must assume that all natural events can be reduced to conditions that make the events possible. But the emergent event presents itself as discontinuous, as a disruption without conditions.

It is by means of the *reconstruction* of the past that the discontinuous event becomes continuous in experience: "The character of the past is that it connects what is unconnected in the merging of one present into another" ("The Nature of the Past" [1929], in *Selected Writings* 351). The emergent event, when placed within a reconstructed past, is a determined event; but since this past was reconstructed from the perspective of the emergent event, the emergent event is also a *determining* event (*The Philosophy of the Present* 15). The emergent event itself indicates the continuities within which the event may be viewed as continuous. There is, then, no question of predicting the emergent, for it is, by definition and also experientially, unpredictable; but once the emergent appears in experience, it may be placed within a continuity dictated by its own character. Determination of the emergent is *retrospective* determination.

Mead's conception of time entails a drastic revision of the idea of the irrevocability of the past. The past is "both irrevocable and revocable" (*The Philosophy of the Present* 2). There is no sense in the idea of an independent or "real" past, for the past is always formulated in the light of the emerging present. It is necessary to continually reformulate the past from the point of view of the newly emergent situation. For example, the movement for the liberation of African-Americans has led to the discovery of the American black's cultural past. "Black (or African-American) History" is, in effect, a function of the emergence of the civil rights movement in the late 1940s and early 1950s and the subsequent development of that movement. As far as most Americans were hitherto concerned, there simply was no history of the American black -- there was only a history of white Europeans, which included the history of slavery in America.

There can be no finality in historical accounts. The past is irrevocable in the sense that *something* has happened; but *what has happened* (i.e., the essence of the past) is always open to question and reinterpretation. Further, the irrevocability of the past "is found in the extension of the necessity with which what has just happened conditions what is emerging in the future" (*The Philosophy of the Present* 3). Irrevocability is a characteristic of the past only in relation to the demands of a present looking into

the future. That is to say that even the sense that *something has happened* arises out of a situation in which an emergent event has appeared as a problem.

Like Edmund Husserl, Mead conceives of human consciousness as *intentional* in its structure and orientation: the world of conscious experience is "intended," "meant," "constituted," "constructed" by consciousness. Thus, objectivity can have *meaning* only within the domain of the subject, the realm of consciousness. It is not that the *existence* of the objective world is constituted by consciousness, but that the *meaning* of that world is so constituted. In Husserlian language, the *existence* of the objective world is *transcendent,* i.e., independent of consciousness; but the *meaning* of the objective world is *immanent*, i.e., dependent on consciousness. In Mead's "phenomenology" of historical experience, then, the past may be said to possess an objective existence, but the *meaning* of the past is constituted or constructed according to the intentional concerns of historical thought. The meaning of the past ("what has happened") is defined by an historical consciousness that is rooted in a present and that is opening upon a newly emergent future.

History is founded on human action in response to emergent events. Action is an attempt to adjust to changes that emerge in experience; the telos of the act is the re-establishment of a sundered continuity. Since the past is instrumental in the re-establishment of continuity, the adjustment to the emergent requires the creation of history. "By looking into the future," Mead observes, "society acquired a history" (*The Philosophy of the Act* 494). And the future- orientation of history entails that every new discovery, every new project, will alter our picture of the past.

Although Mead discounts the possibility of a transcendent past (i.e., a past independent of any present), he does not deny the possibility of validity in historical accounts. An historical account will be valid or correct, not absolutely, but *in relation to* a specific emergent context. Accounts of the past "become valid in interpreting [the world] in so far as they present a history of becoming in [the world] leading up to that which is becoming today . . . . " (*The Philosophy of the Present* 9). Historical thought is valid in so far as it renders change intelligible and permits the continuation of activity. An appeal to an absolutely correct account of the past is not only impossible, but also irrelevant to the actual conduct of historical inquiry. A meaningful past is a *usable* past.

Historians are, to be sure, concerned with the *truth* of historical accounts, i.e., with the "objectivity" of the past. The historical conscience seeks to reconstruct the past on the basis of evidence and to present an accurate interpretation of the data of history. Mead's point is that all such reconstructions and interpretations of the past are grounded in a present that is opening into a future and that the time-conditioned nature and interests of historical thought made the construction of a purely "objective" historical account impossible. Historical consciousness is "subjective" in the sense that it aims at an interpretation of the past that will be humanly *meaningful* in the present and in the foreseeable future. Thus, for Mead, historical inquiry is the imaginative-but-honest, intelligent-and-intelligible reconstruction and interpretation of the human past on the basis of all available and relevant evidence. Above all, the historian seeks to define the *meaning* of the human past and, in that way, to make a contribution to humanity's search for an overall understanding of human existence.

[Return to Section Headings]

Sociality and Time

The emergent event, then, is basic to Mead's theory of time. The emergent event is a becoming, an unexpected occurrence "which in its relation to other events gives structure to time" (*The Philosophy of the Present* 21). But what is the ontological status of emergence? What is its relation to the general structure of reality? The possibility of emergence is grounded in Mead's conception of the relatedness, the "sociality," of natural processes.

Mead's philosophy arises from a fundamental ecological vision of the world, a vision of the world containing a multiplicity of related systems (e.g., the bee system and the flower system, which together form the bee-flower system). Nature is a system of systems or relationships; it is not a collection of particles or fragments which are actually separate. Distinctions, for Mead, are abstractions within fields of activity; and all natural objects (animate or inanimate) exist within systems apart from which the existence of the objects themselves is unthinkable.

The sense of the organic body arises with reference to "external" objects; and these external objects in turn derive their character from their relation to an organic individual. The body-object and the physical object arise with reference to each other, and it is this relationship, in Mead's view, that constitutes the reality of each referent. "It is over against the surfaces of other things that the outside of the organism arises in experience, and then the experiences of the organism which are not in such contacts become the inside of the organism. It is a process in which the organism is bounded, and other things are bounded as well" (*The Philosophy of the Act* 160). Similarly, the resistance of the object to organic pressure is, in effect, the *activity* of the object; and this activity becomes the "inside" of the object. The inside of the object, moreover, is not a projection from the organism, but is *there* in the relation between the organism and thing (see *The Philosophy of the Present* 122-124, 131, 136). The relation between organism and object, then, is a *social* relation (*The Philosophy of the Act* 109-110).

Thus, the relation between a natural object (or event) and the system within which it exists is not unidirectional. The character of the object, on the one hand, is determined by its membership in a system; but, on the other hand, the character of the system is determined by the activity of the object (or event). There is a mutual determination of object and system, organism and environment, percipient event and consentient set (*The Philosophy of the Act* 330).

While this mutuality of individual and system is characteristic of all natural processes, Mead is particularly concerned with the biological realm and lays great emphasis on the interdependence and interaction of organism and environment. Whereas the environment provides the conditions within which the acts of the organism emerge as possibilities, it is the activity of the organism that transforms the character of the environment. Thus, "an animal with the power of digesting and assimilating what could not before be digested and assimilated is the condition for the appearance of food in his environment" (*The Philosophy of the Act* 334). In this respect, "what the individual is determines what the character of his environment will be" (*The Philosophy of the Act* 338).

The relation of organism and environment is not static, but dynamic. The activities of the environment alter the organism, and the activities of the organism alter the environment. The organism-environment relation is, moreover, complex rather than simple. The environment of any organism contains a multiplicity of processes, perspectives, systems, any one of which may become a factor in the organism's field of activity. The ability of the organism to act with reference to a multiplicity of situations is an example of the sociality of natural events. And it is by virtue of this sociality, this "capacity of being

several things at once" (*The Philosophy of the Present* 49), that the organism is able to encounter novel occurrences.

By moving from one system to another, the organism confronts unfamiliar and unexpected situations which, because of their novelty, constitute problems of adjustment for the organism. These emergent situations are possible given the multiplicity of natural processes and given the ability of natural events (e.g., organisms) to occupy several systems at once. A bee, for example, is capable of relating to other bees, to flowers, to bears, to little boys, albeit with various attitudes. But sociality is not restricted to animate events. A mountain may be simultaneously an aspect of geography, part of a landscape, an object of religious veneration, the dialectical pole of a valley, and so forth. The capacity of sociality is a universal character of nature.

There are, then, two modes of sociality: (1) Sociality characterizes the "process of readjustment" by which an organism incorporates an emergent event into its ongoing experience. This sociality in passage, which is "given in immediate relation of the past and present," constitutes *the temporal mode of sociality* (*The Philosophy of the Present* 51). (2) A natural event is social, not only by virtue of its dynamic relationship with newly emergent situations, but also by virtue of its simultaneous membership in different systems *at any given instant*. In any given present, "the location of the object in one system places it in the others as well" (*The Philosophy of the Present* 63). The object is social, not merely in terms of its temporal relations, but also in terms of its relations with other objects in an instantaneous field. This mode of sociality constitutes the emergent event; that is, the state of a system at a given instant is the social reality within which emergent events occur, and it is this reality that must be adjusted to the exigencies of time. Thus, the principle of sociality is the ontological foundation of Mead's concept of emergence: sociality is the ground of the possibility of emergence as well as the basis on which emergent events are incorporated into the structure of ongoing experience.

[Return to Section Headings]

Temporality and the Problem of Freedom

When Mead's theory of the self is placed in the context of his description of the temporality of human existence, it is possible to construct an account, not only of the reality of human freedom, but also of the conditions that give rise to the experience of *loss* of freedom.

Mead grounds his analysis of human consciousness in the social process of communication and, on that foundation, makes "the other" an integral part of self- understanding. The world in which the self lives, then, is an inter- subjective and interactive world -- a "populated world" containing, not only the individual self, but also other persons. Intersubjectivity is to be explained in terms of that "meeting of minds" which occurs in conversation, learning, reading, and thinking (*The Philosophy of the Act* 52-53). It is on the basis of such socio-symbolic interactions between individuals, and by means of the conceptual symbols of the communicational process, that the mind and the self come into existence.

The human world is also temporally structured, and the temporality of experience, Mead argues, is a flow that is primarily *present*. The past is part of my experience *now*, and the projected future is also part of my experience *now*. There is hardly a moment when, turning to the temporality of my life, I do not find myself existing in the *now*. Thus, it would appear that whatever *is* for me, *is now*; and, needless to say, whatever is *of importance* or whatever is *meaningful* for me, is of importance or is meaningful *now*. This is true even if that which is important and meaningful for me is located in the "past" or in the "future."

Existential time is *time lived in the now*. My existence is rooted in a "living present," and it is within this "living present" that my life unfolds and discloses itself. Thus, to gain full contact with oneself, it is necessary to focus one's consciousness on the present and to appropriate that present (that "existential situation") as one's own.

This "philosophy of the present" need not lead to a careless, "live only for today" attitude. Our past is always with us (in the form of memory, history, tradition, etc.), and it provides a context for the "living present." We live "in the present," but also "out of the past;" and *to live well now*, we cannot afford to "forget" the past. A fully meaningful human existence must be "lived now," but with continual reference to the past: we must continue to affirm "that which has been good," and we must work to eliminate or to avoid "that which has been bad." Moreover, a full human existence must be lived, not only in-the-present-out-of-the-past, but also in- the-present-toward-the-future. The human present opens toward the future. "Today" must always be lived with a concern for "tomorrow," for we are continually moving toward the future, whether we like it or not. Further, we are "called" into this future, toward ever new possibilities; and we must, if we wish to live well, develop a "right mindfulness" which orients our present- centered consciousness toward the possibilities and challenges of the impending future. But we must "live now" with reference to both past and future.

The self, as we have seen, is characterized in part by its activity (the "I") in response to its world, and *how* the individual is active with respect to his world is through his choices and his awareness of his choices. The individual experiences himself as having choices, or as being confronted with situations which require choices on his part. He does not (ordinarily) experience himself as being controlled by the world. The world presents obstacles to him, and yet he experiences himself as being able to respond to these obstacles in a variety (even though a finite variety) of ways.

One loses one's freedom, even one's selfhood, when one is unaware of one's choices or when one refuses to face the fact that one *has* choices. From the standpoint of Mead's description of the temporality of action and his emphasis on the importance of problematic situations in human experience, emergencies or "crises" in one's life are of the utmost existential significance. I am a being that exists *in relation to* a world. As such, it is essential that I experience myself as "in harmony with" the world; and if this proves difficult or impossible, then I am thrown into a "crisis," i.e., I am threatened with *separation* (Greek, *krisis*) from the world; and separation from the world, from the standpoint of a being- in-the-world, is tantamount to non- being. It is in this context that the loss of one's freedom, the experience of lost autonomy, becomes a real possibility. Encountering a crisis in the process of life, the individual may well experience himself as paralyzed, as "stuck" in his situation, as patient rather than as agent of change. But it is also the case that the experience of crisis may lead to a deepened sense of one's active involvement in the temporal unfolding of life. From Mead's point of view, a crisis is a "crucial time" or a turning-point in individual existence: negatively, it is a threat to the individual's continuity in and with his world; positively, it is an opportunity to redefine, broaden, and deepen the individual's sense of self and of the world to which the self is ontologically related.

Thus, it would appear that crises may in fact undermine the sense of freedom of choice; and yet, it is also true that crises constitute opportunities for the exercise of freedom since such "breaks" or discontinuities in our experience demand that we make decisions as to what we are "going to do now." In this way, break-*downs* might be viewed as break- *throughs*. Freedom denied on one level of experience is rediscovered at another. One must lose oneself in order to find oneself.

[Return to Section Headings]

Perception and Reflection: Mead's Theory of Perspectives

Mead's concept of sociality, as we have seen, implies a vision of reality as situational, or perspectival. A perspective is "the world in its relationship to the individual and the individual in his relationship to the world" (*The Philosophy of the Act* 115). A perspective, then, is a situation in which a percipient event (or individual) exists with reference to a consentient set (or environment) and in which a consentient set exists with reference to a percipient event. There are, obviously, many such situations (or perspectives). These are not, in Mead's view, imperfect representations of "an absolute reality" that transcends all particular situations. On the contrary, "these situations are the reality" which is the world (*The Philosophy of the Act* 215).

Distance Experience

For Mead, perceptual objects arise within the act and are instrumental in the consummation of the act. At the perceptual stage of the act, these objects are *distant* from the perceiving individual: they are "over there;" they are "not here" and "not now." The distance is both spatial and temporal. Such objects invite the perceiving individual to act with reference to them, to "make contact" with them. Thus, Mead speaks of perceptual objects as "plans of action" that "control" the "action of the individual" (*The Philosophy of the* Present 176 and *The Philosophy of the Act* 262). Distance experience implies contact experience. Perception leads on to manipulation.

The readiness of the individual to make contact with distant objects is what Mead calls a "terminal attitude." Terminal attitudes "are beginnings of the contact response that will be made to the object when the object is reached" (*The Philosophy of the Act* 161). Such attitudes "are those which, if carried out into overt action, would lead to movements which, if persevered in, would overcome the distances and bring the objects into the manipulatory sphere" (*The Philosophy of the Act* 171). A terminal attitude, then, is an implicit manipulation of a distant object; it stands at the beginning of the act and is an intellectual-and-emotional posture in terms of which the individual encounters the world. As present in the beginning of the act, the terminal attitude contains the later stages of the act in the sense that perception implies manipulation and in the sense that manipulation is aimed at the resolution of a problem. In terminal attitudes, all stages of the act interpenetrate.

Within the act, then, there is a tendency on the part of the perceiving individual to approach distant objects in terms of the "values of the manipulatory sphere." Distant objects are perceived "with the dimensions they would have if they were brought within the field in which we could both handle and see them" (*The Philosophy of the Act* 170-171). For example, a distant shape is *seen* as being palpable, as having a certain size and weight, as having such and such a texture, and so forth. In perception, the manipulatory area is extended, and the distant object becomes hypothetically a contact object.

In immediate perceptual experience, the distant object is in the future. Contact with the distant object is implicit, i.e., *anticipated*. "The percept," according to Mead, "is there as a promise" (*The Philosophy of the Act* 103). In so far as the act of perception involves terminal attitudes, the promise (or futurity) of the distant object is "collapsed" into a hypothetical "now" in which the perceiving individual and the

perceptual object exist simultaneously. The temporal distance between individual and object is thus suspended; this suspension of time permits alternative (and perhaps conflicting) contact reactions to the object to be "tested" in imagination. Thus, the act may be "completed" in abstraction before it is completed in fact. In this sense, "the percept is a collapsed act" (*The Philosophy of the Act* 128).

The contemporaneity of individual and distant object is an abstraction within the act. In the collapsed act, time is abstracted from space "for the purposes of our conduct" (*The Philosophy of the Present* 177). Prior to actual manipulation, the perceiving individual anticipates a variety of ways in which a given object *might* be manipulated. This implicit testing of alternative responses to the distant object is the essence of reflective conduct. The actual futurity of the distant object is suspended, and the object is treated *as though* it were present in the manipulatory area. The time of the collapsed act, therefore, is an abstracted time that involves "the experience of inhibited action in which the goal is present as achieved through the individual assuming the attitude of contact response, and thus leaving the events that should elapse between the beginning and the end of the act present only in their abstracted character as passing" (*The Philosophy of the Act* 232).

Thus, in the abstracted time of the collapsed act, "certain objects cease to be events, cease to pass as they are in reality passing and in their permanence become the conditions of our action, and events take place with reference to them" (*The Philosophy of the Present* 177). The perceiving individual's terminal attitudes constitute an anticipatory contact experience in which the futurity of distant objects is reduced to an abstract contemporaneity. This reduction of futurity, we have seen, is instrumental in the reflective conduct of the acting individual.

In perception, then, distant objects are reduced to the manipulatory area and become (hypothetically) contact objects. "The fundamentals of perception are the spatio temporal distances of objects lying outside the manipulatory area and the readiness of the organism to act toward them as they will be if they come within the manipulatory area" (*The Philosophy of the Act* 104). Perception involves the assumption of contact qualities in the distant object. The object is removed from its actual temporal position and is incorporated in a "permanent" space which is actually the space "of the manipulatory area, hypothetically extended" (*The Philosophy of the Act* 185). The object, which is actually spatio- temporally distant, becomes, hypothetically and for the purposes of reflective conduct, spatio- temporally *present*: it is, in the perceiving individual's assumption of the contact attitude, both "here" and "now."

[Return to Section Headings]

Perspectives

Early modern accounts of perception, in an attempt to ground the theories and methods of modern science in a philosophical framework, made a distinction between the "primary" and "secondary" qualities of objects. Galileo articulated the latter distinction as follows:

> I feel myself impelled by the necessity, as soon as I conceive a piece of matter or corporeal substance, of conceiving that in its own nature it is bounded and figured in such and such a figure, that in relation to others it is either large or small, that it is in this or that place, in this or that time, that it is in motion or remains at rest . . . , that it is single, few or many; in short by no imagination can a body be separated from such conditions: but that it must be white or red, bitter or sweet, sounding or mute, of a pleasant or unpleasant odour, I do not perceive my mind forced to acknowledge it necessarily accompanied by such conditions; so if the

> senses are not the escorts, perhaps the reason or the imagination by itself would never have arrived at them. Hence I think that these tastes, odours, colors, etc., on the side of the object in which they seem to exist, are nothing but mere names, but hold their residence solely in the sensitive body; so that if the animal were removed, every such quality would be abolished and annihilated (quoted by E.A. Burtt, *The Metaphysical Foundations of Modern Physical Science* [Doubleday, 1932], 85-86).

Another way of putting this is to say that the *primary qualities* of an object are those which are subject to precise mathematical calculation, whereas the *secondary qualities* of the object are those which are rooted in the sensibility of the perceiving organism and which are therefore not "objectively" quantifiable. The primary qualities (number, position, extension, bulk, and so forth) are *there* in the object, but the secondary qualities are *subjective* reactions to the object on the part of the sensitive organism. A corollary of this doctrine is that the primary qualities, because they are objective, are more "knowable" than are the subjective secondary qualities.

A serious breakdown in the theory of primary and secondary qualities appeared in the critical epistemology of George Berkeley. According to Berkeley, whatever we know of objects, we know on the basis of perception. The primary as well as the secondary qualities of objects are apprehended in sensation. Moreover, primary qualities are never perceived except in conjunction with secondary qualities. Both primary and secondary qualities, therefore, are derived from perception and are ideas "in the mind." When we "know" the primary qualities of an object, what we "know" are "our own ideas and sensations." Thus, Berkeley calls into question the "objectivity" of the primary qualities; these qualities, it would appear, are as dependent upon a perceiving organism as are secondary qualities. The outcome of Berkeley's radical subjectivism (which reaches its apogee in the skepticism of Hume) is an epistemological crisis in which the "knowability" of the external world is rendered problematic.

Mead's account of distance experience offers a description of the experiential basis of the separation of primary and secondary qualities. In the exigencies of action, we have seen, there is a tendency on the part of the acting individual to reduce distant objects to the contact area. "It is this collapsing of the act," according to Mead, "which is responsible for the so- called subjective nature of the secondary qualities . . . [of] objects" (*The Philosophy of the Act* 121). The contact characters of the object become the main focus within the act, while the distance characters are bracketed out (i.e., held in suspension or ignored for the time being). For the purposes of conduct, "the reality of what we see is what we can handle" (*The Philosophy of the Act* 105). In Mead's analysis of perception, the distinction between distance and contact characters is roughly equivalent to the traditional distinction between secondary and primary qualities, respectively. For Mead, however, the distance characters of an object are not "subjective," but are as objective as the contact characters. Distance characters (such as color, sound, odor, and taste) are *there* in the act; they appear in the transition from impulse to perception and are present even in manipulation: "In the manipulatory area one actually handles the colored, odorous, sounding, sapid object. The distance characters seem to be no longer distant, and the object answers to a collapsed act" (*The Philosophy of the Act* 121).

Mead's theory of perspectives is, in effect, an attempt to make clear the objective intentionality of perceptual experience. In Mead's relational conception of biological existence, there is a mutual determination of organism and environment; the character of the organism determines the environment, just as the character of the environment determines the organism.

In his opposition to outright environmental determinism, Mead points out that the sensitivity, selectivity, and organizational capacities of organisms are sources of the control of the environment by the form. On the human level, for example, we find the phenomenon of *attention*. The human being selects her stimuli and thereby organizes the field within which she acts. Attention, then, is characterized by its selectivity and organizing tendency. "Here we have the organism as acting and deter mining its environment. It is not simply a set of passive senses played upon by the stimuli that come from without. The organism goes out and determines what it is going to respond to, and organizes the world" (*Mind, Self and Society* 25). Attention is the foundation of human intelligence; it is the capacity of attention that gives us control over our experience and conduct. Attention is one of the elements of human freedom.

The relation between organism and environment is, in a word, *inter*active. The perceptual object arises within this interactive matrix and is "determined by its reference to some percipient event, or individual, in a consentient set" (*The Philosophy of the Act* 166). In other words, perceptual objects are perspectively determined, and perspectives are determined by perceiving individuals.

> Even when we consider only sense data, the object is clearly a function of the whole situation whose perspective is determined by the individual. There are peculiarities in the objects which depend upon the individual as an organism and the spatio-temporal position of the individual. It is one of the important results of the modern doctrine of relativity that we are forced to recognize that we cannot account for these peculiarities by stating the individual in terms of his environment. (*The Philosophy of the Act* 224).

The perceiving individual cannot be explained in terms of the so-called external world, since that individual is a necessary condition of the appearance of that world.

Mead thus abandons, on the basis of his interpretation of relativity theory, the object of Newtonian physics. But in addition to denying the concrete existence of independent objects, he also denies the existence of the independent psyche. There is nothing subjective about perceptual experience. If objects exist with reference to the perceiving individual, it is also true that the perceiving individual exists with reference to objects. The qualities of objects (distance as well as contact qualities) exist in the relation between the perceiving individual and the world. The so-called secondary sensuous qualities, therefore, are objectively present in the individual-world matrix; sensuous characters *are there* in a given perspective on reality.

In actual perceptual experience, the object is objectively present in relation to the individual. Whereas the relation between the world and the perceiving individual led Berkeley to a radical subjectification of experience, Mead's relationism leads him to an equally radical *objectification* of experience.

Perspectives, in Mead's view, are objectively real. Perspectives are "there in nature," and natural reality is the overall "organization of perspectives." There is, so far as we can directly *know*, no natural reality beyond the organization of perspectives, no noumena, no independent "world of physical particles in absolute space and time" (*The Philosophy of the Present* 163). The cosmos is nature stratified into a multiplicity of perspectives, all of which are interrelated. Perspectival stratifications of nature "are not only there in nature but they are the only forms of nature that are there" (*The Philosophy of the Present* 171).

The Scientific Object

Mead distinguishes two main types of perspective: (1) the perceptual perspective and (2) the reflective perspective. A *perceptual perspective* is rooted in the space-time world in which action is unreflective. This is the world of immediate perceptual experience. A *reflective perspective* is a response to the world of perceptual perspectives. The perspectives of fig trees and wasps are, from the standpoint of the trees and wasps (hypothetically considered), perceptually independent, except for certain points of intersection (i.e., actual contacts). "But in the reflective perspective of the man who plants the fig trees and insures the presence of the wasps, both life-histories run their courses, and their intersection provides a dimension from which their interconnection maintains their species" (*The Philosophy of the Act* 185). Reflectively, the fig tree perspective and the wasp perspective form a single perspective "that includes the perspectives of both" (*The Philosophy of the Act* 184). The world of reflective perspectives is the world of reflective thought and action, the world of distance experience and the world of scientific inquiry. It is within the reflective perspective that the hypothetical objects of the collapsed act arise. Since Mead's conception of distance experience has been discussed earlier, the present analysis will concentrate on the emergence of the scientific object in reflective experience.

Corresponding to the two types of perspective outlined above are two attitudes toward the perceptual objects which arise in experience. There is, first, and corresponding to the perceptual perspective, "the attitude of immediate experience," which is grounded in "the world that is there" (*The Philosophy of the Act* 14). *The world that is there* (a phrase Mead uses over and over again) includes our own acts, our own bodies, and our own psychological responses to the things that emerge in our ongoing activity. Perceptual objects, in *the world that is there*, are what they appear to be in their relation to the perceiving individual.

The second attitude toward perceptual objects is that of "reflective analysis," which attempts to set forth the preconditions of perceptual experience. This attitude corresponds to the reflective perspective. It is through reflective analysis of perceptual objects that scientific objects are constructed. Examples of scientific objects are the Newtonian notions of absolute space and absolute time, the concept of the world at an instant (absolute simultaneity), the notion of "ultimate elements" (atoms, electrons, particles), and so on. Such objects, according to Mead, are hypothetical abstractions which arise in the scientific attempt to explain the world of immediate experience. "The whole tendency of the natural sciences, as exhibited especially in physics and chemistry, is to replace the objects of immediate experience by hypothetical objects which lie beyond the range of possible experience" (*The Philosophy of the Act* 291). Scientific objects are not objects of experience. Science accounts for the perceptible in terms of the non-perceptible (and often the *im*perceptible).

There is a danger in the reflective analysis of *the world that is there*, namely, the reification of scientific objects and the subjectification of perceptual objects. That is, it is possible to conceive of the perceptual world as a product of organic sensitivity (including human consciousness) while the world of scientific objects is "conceived of as entirely independent of perceiving individuals" (*The Philosophy of the Act* 284- 285). According to Mead, this formulation of the relation between scientific objects and perceptual objects is "entirely uncritical" (*The Philosophy of the Act* 19). The alleged separation of scientific and perceptual objects leads to a "bifurcated nature" in which experience is cut off from reality through the dualism of primary and secondary qualities. Mead's critique of the latter doctrine, discussed above, reveals that "the organism is a part of the physical world we are explaining" (*The Philosophy of the Act* 21). and that the perceptual object, with all of its qualities, is objectively there in the relation between

organism and world. The scientific object, moreover, has ultimate reference to the perceptual world. The act of reflective analysis within which the scientific object arises presupposes *the world that is there* in perceptual experience. Scientific objects are abstractions within the reflective act and are, in effect, attempts to account for the objects of perceptual experience. And it is to *the world that is there* that the scientist must go to confirm or disconfirm the hypothetical objects of scientific theory.

Reflective analysis thus arises within and presupposes an unreflective world of immediate experience. And it is this immediate world "which is the final test of the reality of scientific hypotheses as well as the test of the truth of all our ideas and suppositions" (*Mind, Self and Society* 352). In *Mind, Self and Society*, Mead refers to the unreflective world as the world of the "biologic individual." "The term," he points out,

> refers to the individual in an attitude and at a moment in which the impulses sustain an unfractured relation with the objects around him . . . . I have termed it "biologic" because the term lays emphasis on the living reality which may be distinguished from reflection. *A later reflection turns back upon it* and endeavors to present the complete interrelationship between the world and the individual in terms of physical stimuli and biological mechanisms [scientific objects]; the actual experience did not take place in this [hypothetical] form but in the form of unsophisticated reality (*Mind, Self and Society* 352, 353, emphasis added).

The world that is there is prior to the reflective world of scientific theory. The reification of scientific objects at the expense of perceptual experience is, in Mead's view, the product of an "uncritical scientific imagination" (*The Philosophy of the Act* 21).

Mead's analysis of the scientific object is an attempt to establish the actual relation between reflective analysis and perceptual experience. His aim is to demonstrate the objective reality of the perceptual world. He does not, however, deny the reality of scientific objects. Scientific objects are hypothetical objects which are real in so far as they render the experiential world intelligible and controllable. Harold N. Lee, in discussing Mead's philosophy, points out that "the task of science is to understand the world we live in and to enable us to act intelligently within it; it is not to construct a new and artificial world except in so far as the artificial picture aids in understanding and controlling the world we live in. *The artificial picture is not be substituted for the world*" (Lee 56, emphasis added). Scientific knowledge is not final, but hypothetical; and the reality of scientific objects is, therefore, hypothetical rather than absolute.

Reflective conduct takes place with reference to problems that emerge in *the world that is there*, and the construction of scientific objects is aimed at solving these problems. Problematic situations occur *within the world that is there*; it is not the entire world of experience that becomes problematic, but only aspects of that world. And while the scientific attitude is "ready to question everything," it does not "question everything at once" (*Selected Writings* 200). "The scientist," according to Mead, "always deals with an *actual* problem;" he does not question "the whole world of meaning," but only that part of the world which has come into conflict with accepted doctrine. The unquestioned aspects of the world "form the necessary field without which no conflict can arise." "The possible calling in question of any content, whatever it may be, means always that there is left a field of unquestioned reality" (*Selected Writings* 205). It is to this field of unquestioned reality that the scientist returns to test his reconstructed theory. "The world of the scientist is always there as one in which reconstruction is taking place with continual shifting of problems, but as *a real world* within which the problems arise" (*Selected Writings* 206,

emphasis added).

Philosophy of History

The Nature of History

History, according to Mead, is the collective time of the social act. Historical thought arises in response to emergent events (crises, new situations, unexpected disruptions) that are confronted in community life. Mead's general description of experiential time holds with reference to the time of historical experience: the continuity of experience is rendered problematic by the emergent event; present and future are cut off from each other, and the past (both in terms of its content and of its meaning) is called into question; the past is reconstructed in such a way that the emergent event is seen as continuous with the past. In this manner, the present difficulty becomes intelligible, and the emergent discontinuity of experience is potentially resolvable. Historical thought is a reconstruction of a communal past in an attempt to understand the nature and significance of a communal present and a (potential) communal future. Historical accounts are never final since historical thought continually restates the past in terms of newly emergent situations in a present that opens upon a future.

Human life is an ongoing process that is temporally structured. The existential present, the "now" within which we act, is dynamic and implies a past and a future. The notion of the world at an instant (the knife-edge present) is, according to Mead, an abstraction within the act which may be instrumental in the pursuit of consummation; but as a description of concrete experience, the knife-edge present is a *specious* present. The specious present is not the actual present of ongoing experience. The present, in Mead's words, "is something that is happening, going on" (*Movements of Thought in the Nineteenth Century* 300). "Our experience is always a passing experience, and . . . this passing experience always involves an extension into other experiences. It is what has just happened, what is going on, what is just appearing in the future, that gives to our experience its peculiar character. It is never an experience just at an instant. There is no such thing as the experience of a bare instant as such" (*Movements of Thought in the Nineteenth Century* 299). Human experience is fundamentally dynamic, and human life is built on a temporal foundation.

The emergent event is the foundation of novelty in experience. This novelty is characteristic, not only of the present, but also of the past and future. The future, on the one hand, lies beyond the emergent present; and the novelty of the future takes the form of the unexpected. The emergent event creates a future that comes to us as a surprise. The past, on the other hand, must be reinterpreted in the light of the emergent event; the result of such reinterpretation is nothing less than a *new past*. Consciousness of the past develops in response to emergent events that alter our sense of temporal relationships.

> We find that each generation has a different history, that it is a part of the apparatus of each generation to reconstruct its history. A different Caesar crosses the Rubicon not only with each author but with each generation. That is, as we look back over the past, it is a different past. The experience is something like that of a person climbing a mountain. As he looks back over the terrain he has covered, it presents a continually different picture. So the past is

> continually changing as we look at it from the point of view of different authors, different generations. It is not simply the future [and present] which is novel, then; the past is also novel (*Movements of Thought in the Nineteenth Century* 116-117).

History is the reconstruction of the past in response to a new present that opens toward a new future. This emphasis on the novelty of human experience pervades Mead's thought. Science, according to Mead, thrives on novelty. Scientific inquiry is, in essence, a response to exceptions to laws. While science, on the one hand, defines knowledge as "finding uniformities, finding rules, laws" (*Movements of Thought in the Nineteenth Century* 270), it also, on the other hand, seeks to upset all uniformities, rules, and laws through the quest for novelty. Scientific inquiry arises out of the conflict between what was expected to happen and what actually happens; contradictions in experience are the starting- points for the scientific reconstruction of knowledge (Mead, *Selected Writings* 188).

Science, for Mead, is a continual reconstruction of our conception of the world in response to novel situations. Mead's slogan for science is, "The law is dead; long live the law!" (*Movements of Thought in the Nineteenth Century* 286). Science is a form of human existence, a way of moving with the changes that emerge before us. Science is essentially "a method, a way of understanding the world" (*Movements of Thought in the Nineteenth Century* 288).

History is the science of the human past. Historical inquiry presents the past "on the basis of actual documents and their interpretation in terms of historical criticism" (*Movements of Thought in the Nineteenth Century* 448). But the historical past, as we have seen, is not independent of present and future. Historical inquiry, like scientific inquiry in general, takes place in a present that has become problematic through the occurrence of an emergent event. An ancient village is unearthed in Asia Minor, and the rise of human civilization is suddenly pushed back five thousand years in time; the demand on the part of African-Americans for liberty and identity leads to a revaluation of black culture in terms of its historical roots.

In Mead's conception of historical method, the past is *in* the present and becomes meaningful *in* the present. As Tonness has suggested, the past is not "a metaphysical reality accessible to present activity," but an "epistemological reference system" which gives coherence to the emerging present (606). Historical thought reconstructs the past continually in an attempt to reveal the cognitive significance of present and future.

It is not only the content of the past that is subject to change. Past events have *meanings* that are also changed as novel events emerge in ongoing experience. The meaning of past events is determined by the relation of those events to a present. The elucidation of such meaning is the task of historical thought and inquiry. An historical account, as we have seen, is true to the extent that the present is rendered coherent by reference to past events. Historical thought reinterprets the past in terms of the present. But this reinterpretation is not capricious. The historical past arises in the reexamination and representation of *evidence*. Historical accounts must be *documented*. No historical account, however, is final. The meaning of the past is always open to question; any given interpretation of the past may be criticized from the standpoint of a different interpretation.

Historical truth, in Mead's view, is *relative* truth. The meaning of the past changes as present slides into present (*The Philosophy of the Present* 9) and as different individuals and groups are confronted with new situations that demand a temporal reintegration of experience. A new present suggests a new future and demands a new past. This interdependence of past, present, and future is the essential character of

human temporality and of historical consciousness.

History and Self- Consciousness

In *Movements of Thought in the Nineteenth Century*, Mead offers the Romantic movement of the late 18th and 19th centuries as an example of the present and future orientation of human inquiries into the past. Mead's description of the Romantics' reconstruction of self-consciousness on the basis of a reconstructed past is a concrete illustration of his conception of historical consciousness as developing with reference to a problematic present. The Romantic historians and philosophers, confronted with the disruption of experience, which was the result of the early modern revolutionary period, turned to the medieval past in an effort to redefine the historical and cultural identity of European man. The major characteristic of Romantic thought, according to Mead, was an attempt to redefine European self-consciousness through the re-appropriation of the historical past. "It was the essence of the Romantic movement to return to the past from the point of view of the self-consciousness of the Romantic period, to become aware of itself in terms of the past" (*Movements of Thought in the Nineteenth Century* 447-448). The European had been cut off from his past by the political and cultural revolutions of the 16th, 17th, and 18th centuries; and in the post-revolutionary world of the early 19th century, the Romantic movement represented the European quest for a reconstructed identity. It was history that provided the basis for this reconstruction.

The Revolt of Reason Against Authority

The idea of rationality has played a central role in modern social theory. The revolt against arbitrary authority "came on the basis of a description of human nature as having in it a rational principle from which authority could proceed" (*Movements of Thought in the Nineteenth Century* 12). Thus, the aim of modern social theory has been to root social institutions in human nature rather than in divine providence. The doctrine of the rights of man and the idea of the social contract, for example, were brought together by Hobbes, Locke, and Rousseau in an effort to ground political order in a purely human world. Society was conceived as a voluntary association of individuals; and the aim of this association was the preservation of natural rights to such goods as life, liberty, and property. Social authority, then, was derived from the individuals who had contracted to live together and to pursue certain human goals. This analysis of society was at the root of the revolutionary social criticism of the eighteenth century.

> When men came to conceive the order of society as flowing from the rational character of society itself; when they came to criticize institutions from the point of view of their immediate function in preserving order, and criticized that order from the point of view of its purpose and function; when they approached the study of the state from the point of view of political science; then, of course, they found themselves in opposition to the medieval attitude which accepted its institutions as given by God to the church (*Movements of Thought in the Nineteenth Century* 13-14).

But the outcome of "the revolution," according to Mead, was not what the philosophers of the age of reason had expected. The institutions of the medieval past (e.g., monarchy, theocracy, economic feudalism) were either eliminated or severely limited in their scope and power. But the new regime

contained reactionary elements of its own. The victorious bourgeoisie began to build a new class society based on the dialectic of capital and labor; and in this new society, the rights of man came to be conceived in terms of the successful struggle for economic power (*Movements of Thought in the Nineteenth Century* 223). Each man came to be viewed as "an economic unit," and the freedom of man became the freedom to compete for profits in the market (*Movements of Thought in the Nineteenth Century* 217).

The initial effects of the rise of capitalist society were disastrous for the working classes. "When labor was brought into the factory centers, there sprang up great cities in which men and women lived in almost impossible conditions. And there sprang up factories built around the machine in which men, women, and children worked under ever so hideous conditions" (*Movements of Thought in the Nineteenth Century* 206). This situation was rationalized by an ideology that defined human rights in terms of economic competition and that "regarded industry as that which provided the morale of a laborer community" (*Movements of Thought in the Nineteenth Century* 207).

Under such conditions, the rights and liberties for which "the revolution" had been fought became more ideological than real. It was only after the subsequent rise of the trade union and socialist movements that the contradiction between ideology and reality began to be transcended.

While "the revolution" was at least partially fulfilled in England and America, it was, from the standpoint of the early nineteenth century, a total failure on the European continent. The French Revolution deteriorated into a period of political terror that laid the foundation for the emergence of Napoleon's imperialism. The ideals of liberty, equality, and fraternity proved inadequate as bases for a fully rational society.

These ideals, in Mead's view, are politically naive. The concept of freedom is *negative*; it is a demand "that the individual shall be free from restraint" (*Movements of Thought in the Nineteenth Century* 22). In the actual political world, where there is a conflict of wills, the concept of freedom falls into contradiction with itself. The freedom of one individual or group often infringes upon the freedom of another individual or group (*Movements of Thought in the Nineteenth Century* 22).

The concept of equality, which demands that "each person shall have . . . the same political [and perhaps economic] standing as every other person" (*Movements of Thought in the Nineteenth Century* 23), is also far removed from the actual conditions of political and economic life. According to Mead, any society is a complex organization of many individuals and groups. These individuals and groups possess varying degrees of power and prestige. Given this situation, the concept of equality is at most an ideal to be pursued; but it is not a description of what goes on the in the concrete social world.

Similarly, the ideal of fraternity, the idea of the comradeship of all humanity, is "much too vague to be made the basis for the organization of the state." The concept of fraternity ignores the fact that, all too often, "people have to depend upon their sense of hostility to other persons in order to identify themselves with their own group" (*Movements of Thought in the Nineteenth Century* 24).

The ideals of liberty, equality, and fraternity are, from Mead's standpoint, *abstract* ideals that could not survive the post-revolutionary struggles for political supremacy and the control of property.

The Romantic movement emerged in the aftermath of the failure of "the revolution." "There came a sense of defeat, after the breakdown of the Revolution, after the failure to organize a society on the basis of liberty, equality, and fraternity. And it is out of this sense of defeat that a new movement arose, a

movement which in general terms passes under the title of 'romanticism'" (*Movements of Thought in the Nineteenth Century* 57). The failure of "the revolution" left Europe in confusion. The European's ties to his medieval past had been severed, but his revolutionary hopes had not been realized. He was caught between two worlds. He could not be sure of his identity. His sense of self was in crisis. The Romantic movement was an attempt to overcome this crisis by returning to and reconstructing the European past. Romanticism, then, was an effort to reestablish the continuity between the past, present, and future of European culture.

[Return to Section Headings]

Romantic Self-Consciousness

The Romantic conception of the self was an outgrowth of Kant's critique of associationism. "What took place in the Romantic period along a philosophical line was to take this [the?] transcendental unity of apperception, which was for Kant a bare logical function, together with the postulation of the self which we could not possibly know but which Kant said we could not help assuming, and compose them into the new romantic self" (*Movements of Thought in the Nineteenth Century* 67). The Romantic self, however, was not conceived of as transcendental. The Romantics did not "postulate" the self; they *asserted* it "as something which is directly given in experience" (*Movements of Thought in the Nineteenth Century* 86). The Romantics agreed with Kant that the self is the basis of all knowledge and judgment. But while the Kantian self had been developed as a regulative concept in the attempt to render experience intelligible, the Romantic self was held to be actually constitutive of experience. The Romantics, Mead argues, established "the existence of our self as the primary fact. That is what we insist upon. That is what gives the standard to values. In that situation the self puts itself forward as its ultimate reality" (*Movements of Thought in the Nineteenth Century* 62). Thus, for the Romantics, knowledge of the self was not only possible, but was viewed as the highest form of knowledge.

At the heart of the Romantic preoccupation with self-consciousness was the question of the relation between subject and object. This question, we have seen, is also a central concern in Mead's ontology and epistemology. Philosophically, the Romantic analysis of the subject- object relation arose in relation to what Mead calls "the age-old problem of knowledge: How can one get any assurance that that which appears in our cognitive experience is real?" (*Movements of Thought in the Nineteenth Century* 80). The early modern revolt of reason against authority had ended in a skepticism which, Mead writes, "shattered all the statements, all the doctrines, of the medieval philosophy. It had even torn to pieces the philosophy of the Renaissance. It had [with Hume's analysis of causation] shattered the natural structure of the world which the Renaissance science had presented in such simplicity and yet such majesty, that causal structure that led Kant to say that there were two things that overwhelmed him, the starry heavens above and the moral law within" (*Movements of Thought in the Nineteenth Century* 80). The Romantics were reacting against this skeptical attitude. They approached the problem of knowledge from the standpoint of the self. The self, for the Romantics, was the pre-condition of experience; and experience, therefore, including the experience of objects, was to be understood in relation to the self. The epistemological problem of Romantic philosophy was to assimilate the not-self to the self, to encompass the objective world within the subjective world, to make the universe- at-large an intimate part of self-consciousness.

Self-consciousness, as was pointed out above, operates in the "reflexive mode." In self- consciousness, the self appears as both subject and object. We can be conscious of our consciousness. Mead points out that this reflexivity of consciousness is the foundation of Descartes' affirmation of the existence of the

self. But Romantic self-consciousness goes beyond the Cartesian *cogito* in observing that "the self does not exist except in relation to something else" (*Movements of Thought in the Nineteenth Century* 74). Self implies not-self; subject implies object. For every subject, there is an object; and for every object, there is a subject. "There cannot be one without the other" (*Movements of Thought in the Nineteenth Century* 78).

The latter insight of Romantic thought is reflected, in a different form, in Mead's doctrine of perspectives. The Romantic view of the object as a constitutive element in experience marks a movement away from Cartesian subjectivism and toward the objectification of experience that occurs in Mead's perspectivism. "For Descartes, I am conscious and therefore exist; for the romanticist, I am conscious of myself and therefore this self, of which I am conscious, exists and with it the objects it knows. The object of knowledge, in this mode at least, is given as there with the same assurance that the thinker is given in the action of thought" (*Movements of Thought in the Nineteenth Century* 83).

Romanticism, then, as Mead presents it, is not an extreme subjectivism. "The romantic attitude is rather the externalizing of the self. One projects one's self into the world, sees the world through the guise, the veil, of one's own emotions. That is the essential feature of the Romantic attitude" (*Movements of Thought in the Nineteenth Century* 75). The world exists in relation to the self; but the world is (objectively) *there* as a necessary structure of human experience. Self and not-self, subject and object, are not contradictories, but dialectical polarities.

Another aspect of Romantic self-consciousness is the view that the self is a dynamic process. The polarity of self and not-self is not a static structure, but an ongoing relationship, "something that is going on" (*Movements of Thought in the Nineteenth Century* 88)."The very existence of the self," Mead writes,

> implies a not-self; it implies a not-self which can be identified with the self. You have seen that the term "self" is a reflexive affair. It involves an attitude of separation of the self from itself. Both subject and object are involved in the self in order that it may exist. The self must be identified, in some sense, with the not-self. It must be able to come back at itself from the outside. The process, then, as involved in the self is the subject-object process, a process within which both of these phases of experience lie, a process in which these different phases can be identified with each other -- not necessarily as the same phase but at least as expressions of the same process (*Movements of Thought in the Nineteenth Century* 88).

The upshot of this point of view, according to Mead, is an activist or pragmatic conception of mind and knowledge. Knowing is a process involving the interaction of self and not-self. Knowledge is a result of a process in which the self takes action with reference to the not-self, in which the not-self is appropriated by the self. In this analysis of the Romantic epistemology, the germ of Mead's own "philosophy of the act" is apparent. The interaction of self and not-self is the foundation, not only of our knowledge of the world, but also of our knowledge of the self. Self-consciousness requires the objectification of the self. The Romantic elucidation of the polarity of self and not-self makes self-objectification (and therefore self- consciousness) theoretically comprehensible. In action toward the not-self, self-discovery becomes possible.

The world, according to Mead, "is organized only in so far as one acts in it. Its meaning lies in the conduct of the individual; and when one has built up his world as such a field of action, then he realizes himself as the individual who carried out that action. That is the only way in which he can achieve a self. One does not get at himself simply by turning upon himself the eye of introspection. One realizes himself

in what he does, in the ends which he sets up, and in the means he takes to accomplish those ends" (*Movements of Thought in the Nineteenth Century* 90). The world is a field of action. In this field, there are tasks to be accomplished; and it is through the accomplishing of tasks, through the appropriation of the not-self by the self, that the self is enlarged and actualized.

Thus, in Mead's analysis, philosophical Romanticism provides a theoretical description of the conditions under which self-consciousness is possible. The fundamental condition of self-consciousness, as we have seen, is self- objectification. However, for Mead, the basic process of self-objectification takes place in interpersonal experience. "We have to realize ourselves by taking the role of another, playing the part of another, taking the attitude of the community toward ourselves, continually seeing ourselves as others see us, regarding ourselves from the standpoint of those about us. This is not the self- consciousness that goes with awkwardness and uneasiness. It is the assured recognition of one's own position, one's social relations, that comes from being able to take the attitude of others toward ourselves" (*Movements of Thought in the Nineteenth Century* 95). This interpretation of self- consciousness, which is the essence of Mead's theory of the self, has its roots in the Romantic analysis of the relation between self and not-self.

[Return to Section Headings]

History and Romantic Self-Consciousness

There is a close connection between historical consciousness and self- consciousness in Romantic thought. The Romantic movement arose out of the failure of the bourgeois revolution. The hopes of the age of reason had not been realized, and the European was faced with a crisis in his sense of historical identity. Romantic consciousness, Mead argues, was a "discouraged" consciousness. In reaction to a disappointing present, the Romantics looked back to the Middle Ages for a model of life that carried with it a certain security. But the bourgeois revolution, for all its failures, had created a new concept of the individual. Post- revolutionary man "looked at himself as having his own rights, regarded himself as having his own feet to stand on." In the Romantic period, European man experienced himself as an individual. "This gave him a certain independence which he did not have before; it gave him a certain self- consciousness that he never had before" (*Movements of Thought in the Nineteenth Century* 59-61). Thus,

> Europe discovered the medieval period in the Romantic period . . . ; but it also discovered itself. In fact, it discovered itself first. Furthermore, it discovered the apparatus by means of which this self-discovery was possible. The self belongs to the reflexive mode. One senses the self only in so far as the self assumes the role of another so that it becomes both subject and object in the same experience. This is the thing of great importance in this whole historical movement (*Movements of Thought in the Nineteenth Century* 63).

The Romantic view of the Middle Ages, then, arose with reference to a problematic present and constituted an attempt on the part of European man to reconstruct the continuity of his experience. This reconstruction of historical time -- which is, as suggested above, a collective time -- resulted in the creation of a new sense of collective identity. The Romantic conception of the medieval past developed as an effort to redefine the self. European man had, in a sense, lost his self, and he turned to history in an attempt to recapture his sense of continuity. "What the Romantic period revealed, then, was not simply a past, but a past as the point of view from which to come back upon the self. One has to grow into the attitude of the other, come back to the self, to realize the self . . . . " (*Movements of Thought in the Nineteenth Century* 60).

Romanticism, in Mead's view, "is a reconstruction of the self through the self's assuming the roles of the great figures of the past" (*Movements of Thought in the Nineteenth Century* 62). In placing oneself at the standpoint of others in the past, one can view oneself in a new light. Here, Mead reveals still another form of experience -- historical experience -- in which the self might be objectified. "That is, the self looked back at is own past as it found it in history. It looked back at it and gave the past a new form as that out of which it had sprung. It put itself back into the past. It lived over again the adventures and achievements of those old heroes with an interest which children have for the lives of their parents -- taking their roles and realizing not only the past but the present itself in that process" (*Movements of Thought in the Nineteenth Century* 69). In the Romantic search for the "historical connections" between past and present, a new past was created, and, with it, a new sense of "how the present had grown out of the past" emerged. History, viewed from the standpoint of Romantic self-consciousness, became the description of "an organized past" which rendered the problematic present of the Romantic period intelligible. Romantic self- consciousness turned to the past, reconstructed the past, and made the past one of the main foundations of the self. Romantic self-consciousness was thereby expanded and deepened through historical consciousness. We might say that the Romantic movement reconstructed western self-consciousness through a reconstruction of western historical consciousness.

The bourgeois revolution had sundered the connection between the past and present of early 19th century Europe and had left the future in question. It was the task of the Romantic movement to redefine European self- consciousness by way of a reconstruction of the continuity of historical time. In so doing, the Romantic movement revealed the present-directedness and future- directedness of historical consciousness and developed, by the way, an historically significant conception of the self as rooted in the experience of time.

[Return to Section Headings]

History and the Idea of the Future

The idea of evolution is central in Mead's philosophy. For Mead, experience is fundamentally processual and temporal. Experience is the undergoing of change. Mead's entire ontology is an expression of evolutionary thinking. His concept of reality-as- process is ecological in structure and dynamic in content. Nature is a system of systems, a multiplicity of "transacting" fields and centers of activity. The relation between organism and environment (percipient event and consentient set) is mutual and dynamic. Both organism and environment are active: the activity of the organism alters the environment, and the activity of the environment alters the organism. There is no way of separating the two in reality, no way of telling which is primary and which secondary. Thus, Mead's employment of the concept of evolution is an aspect of his attempt to avoid the behavioristic and environmentalist determinism that would regard the organism as passive and as subject to the caprices of nature.

History as Evolution

Mead's concept of evolution is stated in social terms. In Mead's ontology, the entire realm of nature is described as social. The ontological principle of sociality is a fundamentally evolutionary concept that describes reality as a process in which percipient events adjust to new situations and adapt themselves to a variety of consentient sets.

Mind, as an emergent in the social act of communication, "lies inside of a process of conduct"

(*Movements of Thought in the Nineteenth Century* 345) and is temporally structured. Reflective intelligence is the peculiarly human way of overcoming the conflicts in experience; it is called into play when action is inhibited, and it has reference to a future situation in which the inhibition is overcome (*Mind*, *Self and Society* 90). And since, as we have seen, the reconstruction of the past is an important element in the temporal organization of human action, historical consciousness becomes a significant instrument in the human evolutionary process. Historical thought redefines the present in terms of a reinterpreted and reconstructed past and thereby facilitates passage into the future.

Human existence, then, is described by Mead in terms of evolution, temporality, and historicity. Human life involves a constant reconstruction of reality with reference to changing conditions and newly emergent situations. This process of evolutionary reconstruction, according to Mead, is evident in institutional change. The historical consciousness fostered by the Romantic movement has permitted us to view human institutions as "structures which arose in a process, and which simply expressed that process at a certain moment" (*Movements of Thought in the Nineteenth Century* 149). For Mead, the ideas of process and structure do not exclude each other, but are related dialectically in actual historical developments. Historical thought, then, becomes one way of getting into "the structure, the movement, the current of the process" (*Movements of Thought in the Nineteenth Century* 149).

Historical consciousness is a way of comprehending change. But it is also a way of fostering change; that is, by comprehending the direction of historical change, one can place oneself within a given current of change and pursue the historical success of that current. In this way, the historically minded individual or group can contribute to the development of new structures within the process of time. This, as Mead points out, is a way of "carrying over revolution into evolution" (*Movements of Thought in the Nineteenth Century* 149).

Mead's conception of historical consciousness is rooted in his view of intelligence as the reconstruction of human experience in response to "new situations." As has been shown earlier, Mead views the novel event as the basis of intelligent conduct. "If there were no new situations, our conduct would be entirely habitual . . . . Conscious beings are those that are continually adjusting themselves, using their past experience, reconstructing their methods of conduct . . . . That is what intelligence consists in, not in finding out once and for all what the order of nature is and then acting in certain prescribed forms, but rather in continual readjustment" (*Movements of Thought in the Nineteenth Century* 290). The historical resort to the past has reference to new situations that emerge in a present and that suggest a future. Human thought, including historical consciousness, is a confrontation with novelty and is aimed at passing from a problematic present to a non-problematic future. And the past is called in and reconstructed in relation to this project of coming to grips with the novelty of experience. "When what emerges is novel, the explanation of this novelty is sought in an order of events in the past which was not previously recognized" (Mead, "Relative Space-Time and Simultaneity" 529). Historical consciousness, as we have seen in the case of the Romantic movement, is instrumental in redefining and maintaining the temporal continuity of human experience.

Novelty, for Mead, is the foundation of consciousness, intelligence, and the freedom of conduct; it is the ground of human experience. "As far as experience is concerned, if everything novel were abandoned, experience itself would cease" (*Movements of Thought in the Nineteenth Century* 290). Human experience is temporal, and, as such, it "involves the continual appearance of that which is new." Thus, "we are always advancing into a future which is different from the past" (*Movements of Thought in the Nineteenth Century* 290). The future is open, and in acting toward the future, man becomes an active

agent in the formulation of his own existence.

Although reality always exists in a present, the telos of this reality is to be found in the future. In Mead's view, the future is a factor, perhaps the main factor, in directing our conduct. It is the nature of intelligent conduct to be future-directed. "We are moving on, in the very nature of the case, in a process in which the past is moving into the present and into the future" (*Movements of Thought in the Nineteenth Century* 509).

Human-directedness-toward-the-future is the foundation of freedom. The mechanistic view of the world is inadequate as an account of freedom; in fact, mechanism, since it denies the possibility of final causes and attempts to explain everything in terms of efficient causes, must deny the possibility of freedom. And yet, the "essence of conduct" is that "it is directed toward goals, ends which, while not yet actual, are operative in the determination of the directions which conduct shall take" (*Movements of Thought in the Nineteenth Century* 317).

Goals, unlike efficient causes, are selected by the organism; and our selection of goals is not explicable (or predictable) on the basis of efficient causes. Thus, "the interpenetration of experience does go into the future. The essence of reality involves the future as essential to itself . . . . The coming of the future into our conduct is the very nature of our freedom" (*Movements of Thought in the Nineteenth Century* 317).

Human action is action toward the future. The past does not determine (although it does condition) human conduct; it is, rather, human conduct that determines the past. Human action takes place in a present that opens on the future, and it is in terms of the emergent present and impending future that the content and meaning of the past are determined. Human acts are teleological rather than mechanical. Thus, as Strauss indicates, Mead's evolutionism permits him "to challenge mechanical conceptions of action and the world and to restate problems of autonomy, freedom and innovation in evolutionary and social rather than mechanistic and individualistic terms" (xviii).

The Ideal of History

Although Mead describes human existence as evolving toward an open future that cannot be prefigured with any finality, he does not ignore the fact that there are ideals that are operative in directing human action. "Cognizant of social realities and wary of utopian panaceas, [writes Reck,] resorting to the method of science in questions of morality rather than to authoritative religions or traditional customs, aware that men consist of impulses and instincts as well as of intelligence, Mead nevertheless discerned that there are ideal ends that operate as standards and goals for human conduct" ("Introduction" xl). That many of the ideal ends humans have pursued have been naive (i.e., at odds with the realities of social and political life) is clear in Mead's criticism of the notions of liberty, equality, and fraternity. Attempts to convert such ideals into realities have often met with frustration in the ironies of history. It is for this reason that Mead argues that ideal ends, in some sense, must be grounded in historical reality; otherwise they become either fanciful wishes or mere ideological and rhetorical pronouncements.

Of the many ideals that have influenced human conduct, Mead selects one for special consideration: the ideal of the *universal community*. This ideal has appeared time and again in the history of human thought and is, in Mead's view, "the ideal or ultimate goal of human social progress" (*Mind, Self and Society* 310). The ideal of the universal community is, then, the ideal of history. According to this ideal, the goal

of history is the establishment of "a society in which everyone is going to recognize the interests of everyone else," a society "in which the golden rule is to be the rule of conduct, that is, a society in which everyone is to make the interests of others his own interest" (*Movements of Thought in the Nineteenth Century* 362). The vision of the universal community is, in fact, the basis of the philosophy of history as a distinctive form of thought. "A philosophy of history arose as soon as men conceived that society was moving toward the realization of triumphant ends in some great far-off event. It became necessary to relate present conduct and transient values to the ultimate values toward which creation moved" (*The Philosophy of the Act* 504). This is the eschatological vision that is at the root of the historical conceptions of St. Paul, St. Augustine, Hegel, Marx, Herbert Spencer, and as we shall see, of Mead himself.

The ideal of the universal community is, however, "an abstraction" in as much as it is not actualized in the concrete world. In the life of the realities of political and social conflict (e.g., the conflict between private and public interests), the ideal of the universal community stands outside of history. And yet, this ideal is, in a sense, an *historical* ideal; that is, the ideal of the universal community, although not *explicit* in history, is, according to Mead, *implicit* in the historical process. The ideal is, on the one hand, operative in the hopes of mankind, and, on the other hand, it is potentially present in certain concrete historical forces. Among these historical forces, Mead finds three of particular importance: (1) the universal religions; (2) universal economic processes; and (3) the process of communication.

Both economic processes and universal religions tend toward a universal community. Religious and economic attitudes tend potentially toward "a social organization which goes beyond the actual structure in which individuals find themselves involved" (*Mind, Self and Society* 290). Commerce and love are both potentially universalizing ideas, and both have been significant factors in the development of human societies. The forces of exchange and love know no boundaries; all men are included (although abstractly) in the community of exchange and love. Although the religious attitude is a more profound form of identifying with others, the economic process, precisely because of its relative superficiality, "can travel more rapidly and make possible easier communication." "It is important to recognize," Mead writes, that these religious and economic developments toward a universal community are "going on in history" (*Mind, Self and Society* 296-197). That is, the movement toward a universal community is an immanent process and not merely an abstract idea. Human history seems to imply a universal community.

A third historical force that implies universality is the process of communication, to which Mead devotes so much of his attention in his various works. Language, as we have seen, is the matrix of social coordination. A linguistic gesture is an action which implies a response from another and which is dependent for its meaning on that response. The process of communication is a way of gesturing toward others, a way of transcending oneself, a way of taking the role of another. The linguistic act both presupposes and implies a human community of unspecified and unlimited extension.

"Language," according to Mead, "provides a universal community which is something like the economic community" (*Mind, Self and Society* 283). It is through significant communication that the individual is able to generalize her experience to include the experiences of others. The world of "thought and reason" that emerges out of the social act of communication is, almost by definition, transpersonal and therefore verges toward the universal. Social organization and social interaction require a commonality of meaning, a "universe of discourse," within which individual acts can take on significance (*Mind, Self and Society* 89-90). The process of significant communication is the source of this universe of discourse.

It is Mead's contention that "the thought world" created in significant communication constitutes the widest of human communities to date. The group "defined by the logical universe of discourse" is that which is the most general of all human groups -- the one that "claims the largest number of individual members." This group is based on "the universal functioning of gestures as significant symbols in the general human social process of communication" (*Mind, Self and Society* 157-158). This universalizing tendency of language comes closer to the realization of the ideal community than do the religious and economic attitudes. These latter, moreover, actually presuppose the communicational process: religion and economics organize themselves as social acts on the basis of communication.

Mead thus states the ideal of history in primarily communicational terms:

> The human social ideal . . . is the attainment of a universal human society in which all human individuals would possess a perfected social intelligence, such that all social meanings would each be similarly reflected in their respective individual consciousnesses -- such that the meanings of any one individual's acts or gestures (as realized by him and expressed in the structure of his self, through his ability to take the social attitudes of other individuals toward himself and toward their common social ends or purposes) would be the same for any other individual whatever who responded to them(*Mind, Self and Society* 310).

Mead's vision seems to imply a society of many personalities (*Mind, Self and Society* 324-325) in perfect communication with one another. Every person would be capable of putting herself into the place of every other person. Such a system of perfect communication, in which the meanings of all symbols are fully transparent, would realize the ideal of a universal human community.

Mead recognizes, of course, how far we are from realizing the universal community. Our religions, our economic systems, and our communicational processes are severely limited. At present, these historical forces separate us as much as they unite us. All three, for example, are conditioned by another historical force which has a fragmenting rather than a universalizing effect on modern culture, namely, nationalism (see Mead, *Selected Writings* 355- 370). Mead points out that "the limitation of social organization is found in the inability of individuals to place themselves in the perspectives of others, to take their points of view" (*The Philosophy of the Present* 165). This limitation is far from overcome in contemporary life. And "the ideal human society cannot exist as long as it is impossible for individuals to enter into the attitudes of those whom they are affecting in the performance of their particular functions" (*Mind, Self and Society* 328). Contemporary culture is a world culture; we all affect each other politically, culturally, economically. Nonetheless, "the actual society in which universality can get its expression has not risen" (*Mind, Self and Society* 267).

But it is also true that the ideal of the universal community is present by implication in our religions, in our economic systems, and in our communicational acts. The ideal is there as a directive in human history. It implies an evolution toward an ideal goal and informs our conduct accordingly.

Mead's social idealism is not utopian, but historical. The ideal of history, the ideal of the universal community, is "an ideal of method, not of program. It indicates direction, not destination" (*The Philosophy of the Act* 519). And in so far as this ideal informs our actual conduct in the historical world, it is a *concrete* rather than an abstract universal (*The Philosophy of the Act* 518-519). The ideal of history is both transcendent and immanent; it is rooted in the past and present, but leads into the future which is always awaiting realization.

Historical thought, then, for Mead, is instrumental in the evolution of human society. It is through the constant reconstruction of experience that human intelligence and human society are expanded. Mead's evolutionary conception of human history is clearly a progressive notion which he seeks to document throughout his writings. There is implicit in human history a tendency toward a larger and larger sense of community. The ultimate formulation of this historical tendency is found in the ideal of the universal community. This ideal is not purely abstract (i.e., extra-historical), but is rooted in actual historical forces such as the universal religions, modern economic forces, and the human communicational process. According to Mead, it is this ideal of the universal community that informs the human evolutionary process and that indicates the implicit direction or teleology of history.

Secondary Sources

The secondary literature on Mead is very extensive. There are books, doctoral dissertations, master's theses, book reviews, and journal articles by philosophers, logicians, psychologists, sociologists, anthropologists, and linguists. The best internet source for bibliography on Mead is "George's Page," the official publication of the Mead Project at Brock University's Department of Sociology in Ontario, Canada. Among other resources, the Mead Page contains a list of more than 450 secondary sources on Mead and his work, and that list is far from complete, a work in progress. See http://paradigm.soci.brocku.ca/~lward/frame2.html (click on "Commentaries").

The following is a selection of books and articles that I have found especially helpful in my own work on Mead.

Books

Aboulafia, Mitchell. *The Mediating Self: Mead, Sartre and Self- Determination* (Yale 1986).

Aboulafia, Mitchell (ed.). *Philosophy, Social Theory and the Thought of George Herbert Mead* (SUNY 1991).

Baldwin, John D. *George Herbert Mead: A Unifying Theory for Sociology*, (Sage 1986).

Cook, Gary A. *George Herbert Mead: The Making of a Social Pragmatist* (University of Illinois 1993).

Corti, Walter Robert (ed.), *The Philosophy of G.H. Mead* (*Amriswiler Bucherei* [Switzerland] 1973).

Goff, Thomas. *Marx and Mead: Contributions to a Sociology of Knowledge* (Routledge 1980).

Hamilton, Peter. *George Herbert Mead: Critical Assessments* (Routledge 1993).

Hanson, Karen. *The Self Imagined: Philos. Reflections on the Social Character of Psyche* (Routledge 1987).

Joas, Hans. *G.H. Mead: A Contemporary Re-Examination of His Thought* (MIT Press 1997).

Joas, Hans. *Pragmatism and Social Theory* (University of Chicago 1993).

Miller, David L. *G.H. Mead. Self, Language, and the World* (University of Chicago 1973).

Morris, Charles. *Signification and Significance: A Study of the Relations of Signs and Values* (MIT Press 1964).

The Internet Encyclopedia of Philosophy

Menippus (fl. 250 BCE.)

Greek philosopher of Gadara in Syria, who flourished about 250 BCE.

Menippus, an adherent of the Cynic School of philosophy, was born at Sinope in Asia Minor, but his family was originally from Gadara, in Palestine. According to Diogenes Laertius, he was at first a slave, but afterward obtained his freedom by purchase, and eventually succeeded, by dint of money, in obtaining citizenship at Thebes. Here he pursued the employment of a money lender, and obtained from this the title "one who lends money at daily interest". Having been defrauded, and having lost, in consequence, all his property, he hung himself in despair. Menippus was the author of several works, now completely lost; they satirized the follies of human kind, especially of philosophers, in a sarcastic tone Among other productions, he wrote a piece entitled "The Sale of Diogenes," and another called "Necromancy". They were a medley of prose and verse, and became models for the satirical works of Varro (hence called *Saturae Menippeae*. It is suggested that the Necromancy inspired an imitator of Lucian to compose the "Menippus, or Oracle of the Dead," which is found among the works of the native of Samosata.

The Internet Encyclopedia of Philosophy

John Stuart Mill (1806-1873)

Life and Writings. **John Stuart Mill was born in London on May 20, 1806, and was the eldest of son of James Mill. He was educated entirely by his father, James Mill, and was deliberately shielded from association with other boys of his age. From his earliest years, he was subjected to a rigid system of intellectual discipline. As a result of this system, according to his own account, he believed this gave him an advantage of a quarter of a century over his contemporaries. Mill recognized, in later life, that his father's system had the fault of appealing to the intellect only and that the culture of his practical and emotional life had been neglected, while his physical health was probably undermined by the strenuous labor exacted from him. James Mill's method seems to have been designed to make his son's mind a first-rate thinking machine, so that the boy might become a prophet of the utilitarian gospel. He had no doubts at the outset of his career. On reading Bentham (this was when he was fifteen or sixteen) the feeling rushed upon him "that all previous moralists were superseded." The principle of the utility, he says, understood and applied as it was by Bentham, "gave unity to my conception of things. I now had opinions; a creed, a doctrine, a philosophy; in one among the best senses of the word, a religion; the inculcation and diffusion of which could be made the principle outward purpose of a life." Soon afterwards he formed a small *Utilitarian Society*, and, for some few years, he was one of "a small knot of young men" who adopted his father's philosophical and political views "with youthful fanaticism." A position under his father in the India Office had secured him against the misfortune of having to depend on literary work for his livelihood; and he found that office-work left him ample leisure for the pursuit of his wider interests.**

He was already coming to be looked upon as a leader of thought when, in his twenty-first year, the mental crisis occurred which is described in his *Autobiography*. This crisis was a result of the severe strain, physical and mental, to which he had been subjected from his earliest years. He was "in a dull state of nerves;" the objects of his life for which he had been trained and for which he had worked lost their charm; he had "no delight in virtue, or the general good, but also just as little in anything else;" a constant habit of analysis had dried up the fountains of feeling within him. After many months of despair he found, accidentally, that the capacity for emotion was not dead, and "the cloud gradually drew off". Another important factor in his life was Mrs. Taylor, who co-authored pieces with him. He maintained a close relationship with her for many years while she was married. When her husband died, Mill married her in 1851. His work in connection with the literary journals was enormous. He wrote articles almost without number and on an endless variety of subjects (philosophical, political, economic, social). They began with *The Westminster Review* and extended to other magazinesespecially *The London Review* and, afterwards, *The London and Westminster Review*. They were valuable as enabling us to trace the development of his opinions, the growth of his views in philosophy, and the gradual modification of his radicalism in politics.

His first great intellectual work was his *System of Logic, R atiocinative and Inductive*, which appeared in 1843. This was followed, in due course by his *Essays on some Unsettled Questions of Political Economy* (1844), and *Principles of Political Economy* (1848). In 1859 appeared his little treatise *On Liberty*, and his *Thoughts on Parliamentary Reform*. His *Considerations on Representative Government* belongs to the year 1860; and in 1863 (after first appearing in magazine form) came his *Utilitarianism*. In the Parliament of 1865-68, he sat as Radical member for Westminister. He advocated three major things in the House of Commonswomen suffrage, the interests of the laboring classes, and land reform in Ireland. In 1865, came his *Examination of Sir William Hamilton's Philosophy*; in 1867, his Rectorial *Inaugural Address* at St. Andrews University, on the value of culture; in 1868, his pamphlet on *England and Ireland*; and in 1869, his treatise on *The Subjection of Women*. Also in 1869, his edition of his father's *Analysis of the Phenomena of the Human Mind* was published. Mill died at Avignon in 1873. After his death were published his *Autobiography* (1873) and *Three Essays on Religion: Nature, the Utility of Religion, and Theism* (1874), written between 1830 and 1870.

Early Writings. **Mill's widened intellectual sympathies were shown by his reviews of Tennyson's poems and of Carlyle's *French Revolution* in 1835 and 1837. The articles on Bentham and on Coleridge, published in 1838 and 1840 respectively, disclose his modified philosophical outlook and the exact measure of his new mental independence. From the position now occupied, he did not seriously depart throughout the strenuous literary work of his mature years. The influence of the new spirit, which he identified with the thinking of Coleridge, did not noticeable develop further; if anything, perhaps, his later writings adhered more nearly to the traditional views than might have been anticipated from some indications in his early articles on Bentham and Coleridge.**

These two articles provide the key for understanding Mill's own thought. He looks upon Bentham as a great constructive genius who had first brought light and system into regions formally chaotic. No finer nor more just appreciation of Bentham's work has ever been written. Mill agrees with Bentham's fundamental principle and approves his method. Bentham made morals and politics scientific, but his knowledge of life was limited. "It is wholly empirical and the empiricism of one who has had little experience." The deeper things of life did not touch him; all the subtler workings of mind and its environment were hidden from his view. It is significant that Mill assumes that, for light on these deeper and subtler aspects of life, we must go not to other writers of the empirical tradition, but to thinkers of an entirely different school. He disagrees with the latter fundamentally in the systematic presentation of their viewswhether these be defended by the easy appeal to intuition or by the more elaborate methods of Schelling or Hegel. What we really get from them are half-lightsglimpses, often fitful and always imperfect, into aspects of truth not seen at all by their opponents. Coleridge represented this type of thought. He had not Bentham's great constructive faculties; but he had insight in regions where Bentham's vision failed, and he appreciated, what Bentham almost entirely overlooked, the significance of historical tradition.

The ideas which Mill derived from the writings of Coleridge, or from his association with younger men who had been influenced by Coleridge, did not bring about any fundamental change in his philosophical standpoint, we can trace their effect. He seems conscious that the analysis which satisfied other followers of Bentham is imperfect, and that difficulties remain which they are unable to solve and cannot even see.

System of Logic. **Mill's *System of Logic* was published in 1843, and ran through many editions. The third (1850) and the eighth (1872) editions, especially, were thoroughly revised and supplemented with new and controversial material. It is his only systematic philosophical treatise. In spite of Hobbe's treatise, and of the suggestive discussions in the third book of Locke's *Essay*, the greater English philosophers almost seem to have conspired to neglect the theory of logic. Logic kept its place as an academic study, but on traditional lines; Aristotle was supposed to have said the last word on it, and that last word was enshrined in scholastic manuals. English thought, however, was beginning to emerge from this stage. Richard Whately had written a text-book, *Elements of Logic* (1826), which gave considerable impetus to the study, and Hamilton's more comprehensive researches had begun. Mill first worked out his theory of terms, propositions, and the syllogism; he then set the book aside for five years. When he returned to it and focused on the inductive process, he found material John Herschel's *Discourse on the Study of Natural Philosophy* (1830), and William Whewell's *History of the Inductive Sciences* (1837). After his theory of induction was substantially complete, he became acquainted with, and derived stimulus and assistance from, the first two volumes of Comte's *Cours de Philosophie Positive* (1830). These were the chief influences on his work.**

The reputation of Mill's *Logic* was largely due to his analysis of inductive proof. He provided the empirical sciences with a set of formula and criteria which might serve the same purpose for them as the time-worn formulae of the syllogism had served for arguments that proceeded from general principles. Mill's work is not merely a logic in the limited sense of that term which had become customary in England. It is also a theory of knowledge such as Locke and Hume provide. Mill's account is made more precise by its reference to the question of proof or evidence. Mill formulates five guiding methods of inductionthe method of agreement, that of difference, the joint or double method of agreement and difference, the method of residues, and that of concomitant variations. The common feature of these methods, the one real method of scientific inquiry, is that of elimination. All the other methods are thus subordinate to the method of difference. Here we have a case of the occurrence of the phenomenon under investigation and a case of its nonoccurrence, these cases having every circumstance in common, save one, that one occurring only in the former; and we are warranted in concluding that this circumstance, in which alone the two cases differ, is either the cause or a necessary part of the cause of the phenomenon.

It is only in the simpler cases of casual connection, however, that we can apply these direct methods of observation and experiment. In the more complex cases, we have to employ the *inductive method,* which consists of three operations: induction, ratiocination or deduction, and verification.

> **To the Deductive Method, thus characterized in its three constituent partsInduction, Ratiocination, and Verificationthe human mind is indebted for its most conspicuous triumphs in the investigation of nature. To it we owe all the theories by which vast and complicated phenomena are embraced under a few simple laws, which, considered as the laws of those great phenomena, could never have been detected by their direct study. (*Logic,* Book III. Chapter XI. Section 3).**

We deduce the law or cause of a complex effect from the laws of the separate causes whose concurrence gives rise to it. For example, "the mechanical and the organized body and the medium in which it subsists, together with the peculiar vital laws of the different tissues constituting the organic structure," afford the clue to "the laws on which the phenomena of life depend" (*Logic,*

III. XI. I). But these "laws of the different causes" must first be ascertained by direct induction, and finally verified, as comparison with the facts of the case. Thus the entire process is based on induction.

> **To warrant reliance on the general conclusions arrived at by deduction, these conclusions must be found, on careful comparison, to accord with the results of direct observation wherever it can be had. . . Thus it was very reasonably deemed an essential requisite of any true theory of the causes of the celestial motions, that it should lead by deduction to Kepler's laws; which, accordingly, the Newtonian theory did. (*Ibid*, III. XI. 3).**

The validity of the entire inductive process is thus clearly seen to depend upon the validity of its underlying assumption, the law of causation itself. Assuming that every phenomenon has a cause, or invariable and unconditional antecedent, we investigate the problem of causation in detail. Is this fundamental assumption itself valid? Mill cannot avail himself of the theory that the *law of universal causation* is an intuition of reason or an a *priori* and transcendental principle. For him the only possible view is that

> **the belief we entertain in the university, throughout nature, of the law of cause and effect, is itself an instance of induction. . . We arrive at this universal law by generalization from many laws of inferior generality. We should never have had the notion of causation (in the philosophical meaning of the term) as a condition of all phenomena, unless many cases of causation, or, in other words, many partial uniformities of sequence, had previously become familiar. The more obvious of the particular uniformities suggest, and give evidence of, the general uniformity, once established, enables us to prove the remainder of the particular uniformities of which it is made up. (*Logic*, III. XXI. 4)**

These early inductions, which result in the law of universal causation, cannot belong to the same type as those rigorous inductions which conform to the canons of scientific induction and presuppose the law of universal causation; they belong to "the loose and uncertain mode of induction *per enumeration simplicem*." How, then, can a process whose basis is thus loose and uncertain have any certain validity? Mill's answer is that induction by simple enumeration, or "generalisation of an observed fact from the mere absence of any known instance to the contrary," as contrasted with the critical induction of science, is a valid, though a fallible process, which must precede the less fallible forms of the inductive process, and that "the precariousness of the method of simple enumeration is in an inverse ratio to the largeness of the generalization."

> **As the sphere widens, this unscientific methods becomes less and less liable to mislead; and the most universal class of truths, the law of causation, for instance, and the principles of number and geometry, are duly and satisfactorily proved by that method alone, nor are they susceptible of any other proof.**

The universality of the law of causation, as it is an induction from our experience, does not extend to "circumstances unknown to us, and beyond the possible range of our experience."

> **In distant parts of the stellar regions, where the phenomena may be entirely unlike those with which we are acquainted, it would be folly to affirm confidently that this general law prevails, any more than those special ones which we have found to hold universally on our own planet. The uniformity in the succession of events, otherwise called the law of causation, must by received, not as a law of the universe, by of that**

> portion of it only which is within the range of our means of sure observation, with a reasonable degree of extension to adjacent cases. To extend it further is to make a supposition without evidence, and to which, in the absence of any ground from experience for estimating its degree of probability, it would be idle to attempt to assign any. (*Logic*, III. XXI. 4)

There is no difficulty in conceiving "that in someone, for instance, of the many firmaments into which sidereal astronomy now divides the universe, events may succeed one another at random without any fixed law; nor can anything in our experience, or in our mental nature, constitute a sufficient, or indeed any, reason for believing that this is nowhere the case" (*Ibid*., III. XXI. 4).

The appearance of paradox in the view that the law of causation is at once the presupposition and the result of induction disappears, according to Mill, with "the old theory of reasoning, which supposes the universal truth, or major premise, in a ratiocination, to be the real proof of the particular truths which are ostensibly inferred from it." His own view is that "the major premise is not the proof of the conclusion, but is itself proved, along with the conclusion, from the same evidence." The old theory implies that the syllogism is a *petitio principii*, since the conclusion the conclusion which is supposed to be proved is already contained in the major premise; if we know that *all men are mortal*, we know, and do not require to prove, that *Socratesis mortal.* "No reasoning from generals to particulars can, as such, prove anything, since from a general principle we cannot infer any particulars, but those which the principle itself assumes as known" (*Ibid*., II. III. 2). The only use of the syllogism is to convict your opponent of inconsistency; it cannot lead us from the known to the unknown. In reality the major premise is a register of previous inductions and a short formula for making more. "The conclusion is not an inference drawn *from* the formula, but an inference drawn *according* to the formula; the real logical antecedent or premise being the particular facts from which the general proposition was collected by induction" (*Logic*, II. III. 4). The major premise is merely a shorthand note, to assist the memory. "The inference is finished when we have asserted that all men are mortal. What remains to be performed afterwards is merely deciphering our own notes." The mistake of the traditional view is,

> that of referring a person to his own notes for the origin of his knowledge. If a person is asked a question, and is at the moment unable to answer it, he may refresh his memory by turning to a memorandum which he carries about with him. But if he would scarcely answer, because it was set down in his notebook: unless the book was written, like the Koran, with a quill from the wing of the angel Gabriel. (*Ibid*., III. III. 3)

All inference is from particulars to particulars; the syllogistic process is only an interpretation of our notes of previous inferences. "If we had sufficiently capacious memories, and a sufficient power of maintaining order among a huge mass of details, the reasoning could go on without any general propositions; they are mere formulae for inferring particulars from particulars" (*Ibid*., III. IV. 3).

Syllologistic reasoning is thus a circuitous way of reaching a conclusion which might have been reached directly, like going up a hill and down again when we might have traveled along the level road. There is no reason why we should be compelled to take the *high priori road* except by the arbitrary fiat of logicians. "Not only *may* we reason from particulars to particulars without passing through generals, but we perpetually do so reason. All our earliest inferences are of this nature" (*Ibid*., II. III. 3). Mill, however, acknowledges "the immense advantage, in point of security for

correctness, which is gained by interposing this step between the real evidence and the conclusion," the importance of "the appeal to former experience in the major premise of the syllogism" (*IBid*., II. III. 6). When we say that Socrates is mortal because he is a man, and all men are mortal, we assert that because he resembles that other individuals in the attributes connoted by the term man, he resembles them further in the attribute morality. "Whether, from the attributes in which Socrates resembles those men who have heretofore died, it is allowable to infer that he resembles them also in being mortal, is a question of Induction" (*Logic*, II. III. 7). The major premise is the record and reminder that we have made that induction, and are therefore not merely warranted, but required, to apply it in particular case before us.

"The chief strength of this false philosophy {intuitionism} in morals, politics, and religion," Mill remarks in his *Autobiography*,

> **lies in the appeal which it is accustomed to make to the evidence of mathematics and of the cognate branches of physical science. To expel it from these, is to drive it from its stronghold: and because this had never been effectually done, the intuitive school, even after what my father had written in his Analysis of Mind, had in appearance, and as far as published writings were concerned, on the whole the best of the argument. In attempting to clear up the real nature of the evidence of mathematical and physical truths, the *System of Logic* met the intuitive philosophers on ground on which they had previously been deemed unassailable; and gave its own explanation, from experience and association, of that peculiar character of what are called necessary truths, which is adduced as proof that their evidence must come from a deeper source than experience. (*Autobiography*, P. 226)**

The peculiar certainty and necessity attributed to these truths is, he argues, "an illusion, in order to sustain which, it is necessary to suppose that those truths relate to, and express the properties of purely imaginary objects." As a matter of fact, the truths of geometry do not hold, except approximately, of the real world, but only of that imaginary world which corresponds to its initial definitions. The truth is that geometry

> **is built on hypothesis; that it owes to this alone the peculiar certainty supposed to distinguish it; and that in any science whatever, by reasoning from a set of hypotheses, we may obtain a body of conclusions as certain as those of geometry, that is, as strictly in accordance with the hypotheses, and as irresistibly compelling assent, *on condition* that those hypotheses are true. (*Logic*, II. V. I)**

As for the axioms which, together with the definition, form the basis of geometrical reasoning, they are in reality "experimental truths, generalizations from observation." The great argument for their *a priori* character is that their opposites are inconceivable. But conceivability "has very little to do with the possibility of the thing in itself, but is in truth very much an affair of accident, and depends on the past history and habits of our own minds" (*Ibid*., II. V. 6). It is the effect of habitual association, itself the result of our earliest and most widely based inductions from experience; it is an acquired incapacity which can hardly, but be mistaken for a natural one, an experimental truth which can hardly, but be mistaken for a necessary one.

It is in the application of the inductive and psychological method to social and political problems that Mill sees the crowning achievement of scientific investigation. This application has yet to be made; the "German Coleridgian school" were "the first (except a solitary thinker here and there) who inquired with any comprehensiveness or depth, into the inductive laws of the existence and

growth of human society" (*Dissertations,* I. 425). To the consideration of this new science of *Ethology,* or the study of the causes influencing the formation of national character, the final book of the *Logic* is devoted. In thus seeking to inaugurate a scientific Sociology, Mill was undoubtedly influenced by Comte, but he was also proceeding on the familiar lines of the Utilitarians, who always regarded character as the product of circumstances, and looked to education to effect the transition from the present unsatisfactory state of things to one more in accordance with their social ideal. The indefinite modifiability of human nature by circumstances is the working hypothesis of the school; all that Mill adds is the demand that social life be conducted on scientific principles. It is significant that Mill finally abandoned the intention to construct the scheme of such a science, and devoted his energies to the writing of his *Political Economy*, published five years after the *Logic*, in 1848. It would be difficult to reconcile the view of the growth of character implied in the desiderated *Ethology* with his insistence upon the importance of individuality, and his protest against the interference of society with the liberty of the individual, in the essay on Liberty, published in 1859.

Examination of Hamilton. **Mill's only other work in general philosophy is the *Examinations of Sir William Hamilton's Philosophy*, published in 1865. "I mean in this book," he writes to Bain, "to do what the nature and scope of the *Logic* forbade me to do there, to face the ultimate metaphysical difficulties of every question on which I touch" (*Letters,* I. 271). The discussion of Hamilton's philosophy was intended, as we learn from the *Autobiography,* to be made the occasion of a thorough-going examination of the rival philosophies of Intuitionism and Empiricism, the controversy between which had, in Mill's eyes, as we have already seen, the utmost practical and social significance.**

> **The difference between these two schools of philosophy, that of Intuition, and that of Experience and Association, is not a mere matter of abstract speculation; it is full of practical consequences, and lies at the foundation of all the greatest differences of practical opinion in an age of progress. In particular, I have long felt that the prevailing tendency toward innateness is one of the chief hindrances to the rational treatment of great social questions, and one of the greatest stumbling blocks to human improvement. It was necessary, therefore, to determine the issue between these two philosophies.**

Mill's *Examination* covers much of the same ground as his *Logic*. Its key contribution is its account of beliefs in the External World and in Mind. As regards the former, Mill elaborates his famous view of the External World as "a Permanent Possibility of Sensation" (*Examination,* Ch. XI). As regards the latter, he elaborates the view of the Self as follows:

> **If we speak of the Mind as a series of feelings, we are obliged to complete the statement by calling it a series of feelings which is aware of itself as past and future; and we are reduced to the alternative of believing that the Mind, or Ego, is something different from any series of feelings, or possibilities of them, or of accepting the paradox, that something which *ex hypothesi* is but a series of feelings, can be aware of itself as a series. The truth is, that we are here face to face with that final inexplicability, at which, as Sir W. Hamilton observes, we inevitably arrive when we reach ultimate facts. (*Ibid,* p. 248)**

In the Appendix to Chapters XI and XII, he speaks more positively of the Self.

> The inexplicable tie, or law, the organic union (as Professor Masson calls it) which connects the present consciousness with the past one, of which it reminds me, is as near as I think we can get to a positive conception of the Self. That there is something real in this tie, real as the sensations themselves, and not a mere product of the laws of thought without any fact corresponding to it, I hold to be indubitable. . . This original element, which has no community of nature with any of the things answering to our names, and to which we cannot give any name but its own peculiar one without implying some false or unguarded theory, is the Ego, or Self. As such, I ascribe a reality to the Egoto my own Minddifferent from that real existence as a Permanent Possibility, which is the only reality I acknowledge in Matter; and by fair experimental inference from that one Ego, I ascribe the same reality to other Egos, or Minds. . . We are forced to apprehend every part of the series as linked with the other parts by something in common, which is not the feelings themselves, any more than the succession of the feelings is the feelings themselves; and as that which is the same in the first as in the second, in the second as in the third, in the third as in the fourth, and so on, must be the same in the first and in the fiftieth, this common element is a permanent element. (*Examination*, Pp. 262, 263)

Utilitarianism. In spite of the numerous ethical discussions in his other writings, Mill's sole contribution to the fundamental problem of the ethical theory was his small volume *Utilitarianism*. It first appeared in *Fraser's Magazine* in 1861 and was reprinted in book-form in 1863. Perhaps he regarded the fundamental positions of Benthamism as too secure to need much elaboration.

In the first Chapter, "General Remarks," Mill argues that moral theories are divided between two distinct approaches: the intuitive and inductive schools. Although both schools agree that there is a single and highest normative principle, they disagree about whether we have knowledge of that principle intuitively (without appeal to experience), or inductively (though experience and observation). Kant represents the best of the intuitive school, and Mill himself defends the inductive school. Mill criticizes Kant's categorical imperative noting that it is essentially the same as utilitarianism since it involves calculating the good or bad consequences of an action to determine the morality of that action. Mill argues that his task is to demonstrate this highest principle inductively.

In Chapter two, "What Utilitarianism Is," Mill gives a precise formulation of the highest principle, and defends the principle against attacks. The highest normative principle is that,

> Actions are right in proportion as they tend to promote happiness; wrong as they tend to produce the reverse of happiness.

Following his predecessors, such as Hume and Bentham, he refers to this as the principle of utility. Mill argues that by "happiness" he means pleasure both intellectual and sensual. However, we have a sense of dignity which has us prefer intellectual pleasures over sensual ones. He continues that the principle of utility involves an assessment of only an action's consequences, and not the motives or character traits of the agent performing the action. In this regard, he rejects classical virtue theory. Mill argues that the principle of utility should be seen as a tool for generating secondary moral principles, such as "don't steal," which promote general happiness. Most of our actions, then, will be judged according to these secondary principles. We should appeal directly to the principle of utility itself only when we face a moral dilemma between two secondary principles.

Suppose, for example, that a moral principle of charity dictates that I should feed a starving neighbor, and a moral principle of self-preservation dictates that I should feed myself. If I do not have enough food to do both, then I should determine whether general happiness would be better served by feeding my neighbor, or feeding myself.

In Chapter three, "The Ultimate Sanction of the Principle of Utility," Mill discusses our motivations to abide by the utilitarian standard of morality. The problem is that we are commonly motivated to not kill or steal, which are specific acts, but it is less clear that we are motivated to promote the broad notion of general happiness. Mill argues that there are two classes of motivations (or sanctions) for promoting general happiness. First, there are external motivations arising from our hope of pleasing and fear of displeasing God and other humans. More importantly, though, there is a motivation internal to the agent herself which is her feeling of duty. For Mill, an agent's feeling of duty consists of a conglomerate of many feelings developed over one's life, such as sympathy, religious feelings, childhood recollections, and self-worth. The binding force of our sense of duty is that we experience pain or remorse when we act against these feelings by not promoting general happiness. Mill argues that duty is a subjective feeling which develops with experience. However, humans have an instinctive feeling of unity which guides the development of duty toward general happiness.

In Chapter four, "The Proof of the Principle," Mill presents his inductive proof of the principle of utility. He begins noting that his proof must be indirect since no foundational principle is capable of a direct proof. Instead, the only way to prove that general happiness is desirable is to show that people actually desire it. His indirect proof is as follows:

> **If X is the only thing desired, then X is the only thing that ought to be desired General happiness is the only thing desired Therefore, general happiness is the only thing that ought to be desired**

Mill believes Premise two is the most controversial and therefore anticipates criticisms. A critic might argue that there are other things we desire besides happiness, such as virtue. Mill responds that everything we desire becomes part of happiness. Happiness, then, is a complex phenomenon composed of many parts, including virtue, love of money, power, and fame.

Chapter five, "The Connection Between Justice and Utility," was originally written as a separate essay, but later incorporated into this work. Critics of utilitarianism argue that morality is not based on consequences of actions (as utilitarians suppose), but is instead based on the foundational and universal concept of justice. Mill sees this as the strongest attack on utilitarianism, and thus sees the concept of justice as a test case for utilitarianism. For, if he can explain the concept of justice in terms of utility, then he has thereby addressed the main nonconsequentialist argument against utilitarianism. Mill offers two counter arguments. First, he argues that all moral elements in the notion of justice depend on social utility. There are two essential elements in the notion of justice: punishment, and the notion that someone's rights were violated. Punishment derives from a combination of vengeance and social sympathy. Vengeance alone has no moral component, and social sympathy is the same thing as social utility. The notion of rights violation also derives from utility. For, rights are claims we have on society to protect us, and the only reason society should protect us is because of social utility. Thus, both elements of justice (i.e. punishment and rights) are based on utility. Mill's second argument is that if justice were as foundational as nonconsequentialists contend, then justice would not be as ambiguous as it is. According to Mill, there are disputes in the notion of justice when examining theories of punishment, fair distribution

of wealth, and fair taxation. These disputes can only be resolved by appealing to utility. Mill concludes that justice is a genuine concept, but that we must see it as based on utility.

Social and Political Writings.

Mill's social and political writings, in addition to occasional articles, consist of the short treatise *Considerations on Representative Government* (1806), *Thoughts on parliamentary Reform* (1859), the essays *On Liberty* (1859) and *On the Subjection of Women* (1869), *Essays on some Unsettled Questions of Political Economy* (1831, 1844) and *The Principles of Political Economy* (1848). The method appropriate to these topics had been already discussed in the chapters on *the Logic of the Moral Sciences* included in his *Logic*. He sought a *via media* between the purely empirical method and the deductive method. The latter, as employed by his father, was modeled on the reasonings of geometry, which is not a science of causation. The method of politics, if it is to be deductive, must belong to a different type, and will (he holds) be the same as that used in mathematical physics. Dynamics is a deductive science because the law of the composition of forces holds; similarly, politics is a deductive science because the causes with which it deals follow this law: the effects of these causes, when conjoined, are the same as the sum of the effects which the same causes produce when acting separatelya striking and unproved assumption. Like his predecessors, Mill postulated certain forces as determining human conduct; especially self-interest and mental association. From their working, he deducted political and social consequences. He did not diverge from the principles agreed upon by those with whom he was associated. Perhaps he did not add very much to them, but he saw their limitations more clearly than others did; the hypothetical nature of economic theory, and the danger that democratic government might prove antagonistic to the causes of individual freedom and of the common welfare. To guard against theses dangers, he proposed certain modifications of the representative system. But his contemporaries, and even his successors, of the same way of thinking in general, for long looked upon the dangers as imaginary, and his proposals for their removal were ignored. The essay *On Liberty* defends of the thesis "that the sole end for which mankind are warranted, individually or collectively, in interfering with the liberty of action of any of their number, is self-protection;" but, as an argument, it meets everywhere with the difficulty of determining the precise point at which the distinction between self-regarding and social (even directly social) activity is to be drawn.

Political Economy.

Mill's *Political Economy* has been variously regarded as an improved Adam Smith and as a popularized Ricardo. Perhaps the latter description is nearer the mark. Its essential doctrines differ little, if at all, from those of Ricardo; the theory of the *wages fund*, for example, is formulated quite in the spirit of Ricardo, though this theory was afterwards relinquished or modified by Mill in consequence of the criticisms of William Thomas Thornton. But the work has a breadth of treatment which sometimes reminds one of Adam Smith; the hypothetical nature of economic theory was not overlooked, and the "applications to social philosophy" were kept in view. In spite of his adherence to the maxim of *laissez faire*, Mill recognized the possibility of modifying the system, he displayed a leaning to the socialist ideal, which grew stronger as his life advanced. His methodical and thorough treatment of economics made his work a text-book for more than a generation, and largely determined the scope of most of the treatises of his own and the succeeding period, even of those written by independent thinkers.

Essays On Religion. **The posthumously published volume of *Essays on Religion* contains three essayson Nature, the Utility of Religion, and Theism. The first and second were written between 1850 and 1858, that is, during the same period as the essays on Utilitarianism and on Liberty, while the third belongs to a much later time, having been written between 1868 and 1870, and is thus "the last considerable work which he completed," and "showsthe latest state of the Author's mind, the carefully balanced result of the deliberations of a lifetime" (*Essays on Religion*, Preface).**

The first essay is a protest against the view that the ideal of human conduct is found in conformity to Nature. It reminds us of Huxley's later condemnation, in his famous Romanes lecture on *Evolutioin and Ethics,* of the cosmic process from the ethical point of view. "In sober truth, nearly all the things which men are hanged or imprisoned for doing to one another, are nature's every day performances" (*Essays on Religion*, p. 28). It is a protest rather against naturalistic ethics than against Natural Theology, but the latter is included in the same condemnation with the former type of theory. The Author of Nature cannot be at once good and omnipotent.

The main argument of the essay on the Utility of Religion, which, like that on Nature, is a fine specimen of Mill's philosophical style, is the sufficiency of the Religion of Humanity and its superiority to all but the best of the supernatural religions. "Let it be remembered that if individual life is short, the life of the human species is not short; its indefinite duration is practically equivalent to endlessness; and being combined with indefinite capability of improvement, it offers to the imagination and sympathies a large enough object to satisfy any reasonable demand for grandeur of aspiration" (*Ibid,* P. 106).

> **The essence of religion is the strong and earnest direction of the emotions and desires towards an ideal object, recognized as of the highest excellence, and as rightfully paramount over all selfish objects of desire. This condition is fulfilled by the Religion on Humanity in as eminent a degree, and in as high a sense, as by the supernatural religions even in their best manifestations, and far more so than in any of their others. (*Ibid*., P. 109)**

The characteristic tendency of supernaturalism is to arrest the development not only of the intellectual, but also of the moral nature. Its appeal is to self-interest rather than to disinterested and ideal motives; and like the intuitional theory of ethics, it stereotypes morality. The special appeal of supernatural religion is to our sense of the mystery which circumscribes our little knowledge, but the same appeal is made, and the same service to the imagination rendered, by Poetry. "Religion and poetry address themselves, at least in one of their aspects, to the same part of the human constitution; they both supply the same want, that of ideal conceptions grander and more beautiful than we see realized in the prose of human life" (*Essays on Religion,* P. 103). "The idealization of our earthly life, the cultivation of a high conception of what it may be made," is "capable of supplying a poetry, and, in the best sense of the word, a religion, equally fitted to exalt the feelings, and (with the same aid from education) still better calculated to ennoble the conduct, than any belief respecting the unseen powers" (*Ibid*., P. 105). Yet "he to whom ideal good, and the progress of the world towards it, are already a religion" may find consolation and encouragement in the belief that he is,

> **a fellow-laborer with the Highest, a fellow-combatant in the great strife; contributing his little which by the aggregation of many like himself becomes much towards that progressive ascendancy, and ultimately complete triumph of good over evil, which history points to, and which this doctrine teaches us to regard as planned by the Being**

> to whom we behold in Nature. Against the moral tendency of this creed no possible objection can lie; it can produce on whoever can succeed in believing it, no other than an ennobling effect. (*Ibid*., P. 117)

The essay on Theism bears evidence, in the imperfection of its construction and the inferiority of its style, to its lack of the author's final revision. The argument for a First Cause is condemned, on the ground that there is a permanent element in nature itself; "as far as anything can be concluded from human experience, Force has all the attributes of a thing eternal and uncreated" (*Ibid*., P. 147). The argument from Design is found to be less unsatisfactory. The principle of the survival of the fittest, while not inconsistent with Creation, "would greatly attenuate the evidence for it." But "leaving this remarkable speculation to whatever fate the progress of discovery may have in store for it," Mill concludes that "it must be allowed that, in the present state of our knowledge, the adaptations in Nature afford a large balance of probability in favor of creation by intelligence" (*Essays on Religion*, P. 174). On the other hand, "it is not too much to say that every indication of Design in the Kosmos is so much evidence against the Omnipotence of the Designer" (*Ibid*., P. 176). The necessity of contrivance, or the adaptation of means to ends, implies limitation of power in the agent. As to Immorality, there is "a total absence of evidence on either side." Miracles, while not impossible, are extremely improbable, even on the hypothesis of a supernatural Being. The reasonable attitude, on all these questions, is that of atheism.

> If we are right in the conclusions to which we have been led by the preceding inquiry, there is evidence, but insignificant for proof, and amounting only to one of the lower degrees of probability. The induction given by such evidence as there is, points to the creation, not indeed of the universe, but of the present order of it, by an Intelligent Mind, whose power over the materials was not absolute, whose love for his creatures was not his sole actuating inducement, but who nevertheless, desired their good. (*Ibid*., P. 242)

Where belief is not warranted, however, hope is permissible, and the imagination need not be controlled by purely rational considerations.

> To me it seems that human life, small and confined as it is, and as considered merely in the present, it is likely to remain even when the progress of material and moral improvement may have freed it from the greater part of its present calamities, stands greatly in need of any wider range and greater height of aspiration for itself and its destination, which the exercise of imagination can yield to it without running counter to the evidence of fact; and that it is a part of wisdom to make the most of any, even small, probabilities on this subject, which furnish imagination with any footing to support itself upon. (*Ibid*, p. 245).

Above all, the conception of a morally perfect being, and of his approbation, is an inspiration for the moral life which would be sorely missed, and Christianity has provided us with an "ideal representative and guide of humanity;" nor, "even now, would it be easy, even for an unbeliever, to find a better translation of the rule of virtue from the abstract into the concrete, than to endeavor so to live that Christ would approve our life" (*Essays on Religion*, P. 255). "The feeling of helping God" in the struggle with evil is "excellently fitted to aid and fortify that real, though purely human religion, which sometimes calls itself the Religion of Humanity and sometimes that of Duty," and which "is destined, with or without supernatural sanctions, to be the religion of the Future."

Mind: Type Identity Theories

A family of views on the relationship between mind and body, Type Identity theories hold that at least some types (or kinds, or classes) of mental states are, as a matter of contingent fact, literally identical with some types (or kinds, or classes) of brain states. The earliest advocates of Type Identity--U.T. Place, Herbert Feigl, and J.J.C. Smart, respectively--each proposed their own version of the theory in the late 50s-early 60s. But it was not until David Armstrong made the radical claim that *all* mental states (including intentional ones) are identical with physical states, that philosophers of mind divided themselves into camps over the issue. Over the years, numerous objections have been levied against Type Identity, ranging from epistemological complaints to charges of Leibniz's Law violations to Hilary Putnam's famous pronouncement that mental states are in fact capable of being "multiply realized." Defenders of Type Identity have come up with two basic strategies in response to Putnam's claim: they restrict type identity claims to *particular* species or structures, or else they extend such claims to allow for the possiblity of *disjunctive* physical kinds. To this day, debate concerning the validity of these strategies--and the truth of Mind-Brain Type Identity--rages in the philosophical literature.

A family of views on the relationship between mind and body, Type Identity theories hold that at least some types (or kinds, or classes) of mental states are, as a matter of contingent fact, literally identical with some types (or kinds, or classes) of brain states. Before a clear and consistent distinction was made in the philosophical literature between mental state *types* and mental state *tokens*, two independent--though by no means unrelated--versions of what came to be known as the "Mind-Brain Identity Theory" arose out of dissatisfaction with Logical Behaviorism (the doctrine, loosely put, that the meaning of mental statements is reducible to statements about behavior and dispositions to behave). In 1956, U.T. Place published a brief article in which the statement "consciousness is a process in the brain" was presented as a reasonable scientific hypothesis. Two years later, in Herbert Feigl's lengthy paper "The 'Mental' and the 'Physical'," Frege's well-known distinction between sense and reference was cited in support of the claim that neurophysiological terms and psychological terms, though widely differing in meaning, pick out the same things. Feigl's paper goes into much greater detail than Place's, but the former has had the greater impact, at least insofar as it inspired J.J.C. Smart's widely disseminated and hotly contested 1959 article, "Sensations and Brain Processes." Place had been a member of Smart's department at the University of Adelaide, and, together with D.M. Armstrong (who would go on to formulate his own version of the Identity Theory), the trio headed what Feigl jokingly referred to as the "United Front of Sophisticated Australian Materialists." In 1960, Sidney Hook published the proceedings of a well-attended "Dimensions of Mind" conference held in New York earlier that year, and debates concerning mind-brain identity began taking center stage in philosophy journals and

classrooms.

I. EARLY VERSIONS OF THE THEORY

Place accepted the Logical Behaviorists' dispositional analysis of cognitive and volitional concepts. With respect to those mental concepts "clustering around the notions of consciousness, experience, sensation, and mental imagery," however, he held that no behavioristic account (even in terms of unfulfilled dispositions to behave) would suffice. Seeking an alternative to the classic dualist position, according to which mental states possess an ontology distinct from the physiological states with which they are thought to be correlated, Place claimed that sensations and the like might very well be processes in the brain-- despite the fact that statements about the former cannot be logically analyzed into statements about the latter. Drawing an analogy with such scientifically verifiable (and obviously contingent) statements as "Lightning is a motion of electric charges," Place cited potential explanatory power as the reason for hypothesizing consciousness-brain state relations in terms of *identity* rather than mere correlation. This still left the problem of explaining introspective reports in terms of brain processes, since these reports (e.g. of a green after-image) typically make reference to entities which do not fit with the physicalist picture (there is nothing green in the brain, for example). To solve this problem, Place called attention to the "phenomenological fallacy"-- the mistaken assumption that one's introspective observations report "the actual state of affairs in some mysterious internal environment." All that the Mind-Brain Identity theorist need do to adequately explain a subject's introspective observation, according to Place, is show that the brain process causing the subject to describe his experience in this particular way is the kind of process which *normally* occurs when there is actually something in the environment corresponding to his description.

At least in the beginning, Smart followed Place in applying the Identity Theory only to those mental concepts considered resistant to behaviorist treatment, notably sensations. Because of the proposed identification of sensations with states of the central nervous system, this limited version of Mind-Brain Type Identity also became known as "Central-State Materialism." Smart's main concern was the analysis of sensation-reports (e.g. "I see a green after-image") into what he described--following Ryle--as "topic-neutral" language (roughly, "There is something going on which is like what is going on when I have my eyes open, am awake, and there is something green illuminated in front of me"). Where Smart diverged from Place was in the explanation he gave for adopting the thesis that sensations are processes in the brain. According to Smart, "there is no conceivable experiment which could decide between materialism and epiphenomenalism" (where the latter is understood as a species of dualism); the statement "sensations are brain processes," therefore, is not a straight-out scientific hypothesis, but should be adopted on other grounds. Occam's razor is cited in support of the claim that, even if the brain-process theory and dualism are equally consistent with the (empirical) facts, the former has an edge in virtue of its simplicity and explanatory utility.

Occam's razor also plays a role in the version of Mind-Brain Type Identity developed by Feigl (in fact, Smart claimed to have been influenced by Feigl as well as by Place). On the epiphenomenalist picture, in addition to the normal physical laws of cause and effect there are psychophysical laws positing mental effects which do not by themselves function as causes for any observable behavior.

In Feigl's view, such "nomological danglers" have no place in a respectable ontology; thus, epiphenomenalism (again considered as a species of dualism) should be rejected in favor of an alternative, monistic theory of mind-body relations. Feigl's suggestion was to interpret the empirically ascertainable correlations between phenomenal experiences ("raw feels") and neurophysiological processes in terms of contingent identity: although the terms we use to identify them have different senses, their referents are one and the same-- namely, the immediately experienced qualities *themselves*. Besides eliminating dangling causal laws, Feigl's picture is intended to simplify our conception of the world: "instead of conceiving of two realms, we have only one reality which is represented in two different conceptual systems."

In a number of early papers, and then at length in his 1968 book, *A Materialist of the Mind*, Armstrong worked out a version of Mind-Brain Type Identity which starts from a somewhat different place than the others. Adopting straight away the scientific view that humans are nothing more than physico-chemical mechanisms, he declared that the task for philosophy is to work out an account of the mind which is compatible with this view. Already the seeds were sown for an Identity Theory which covers *all* of our mental concepts, not merely those which fit but awkwardly on the Behaviorist picture. Armstrong actually gave credit to the Behaviorists for logically connecting internal mental states with external behavior; where they went wrong, he argued, was in *identifying* the two realms. His own suggestion was that it makes a lot more sense to define the mental not as behavior, but rather as the inner *causes* of behavior. Thus, "we reach the conception of a mental state as a state of the person apt for producing certain ranges of behavior." Armstrong's answer to the remaining empirical question--what in fact is the intrinsic nature of these (mental) causes?--was that they are physical states of the central nervous system. The fact that Smart himself now holds that all mental states are brain states (of course, the reverse need not be true), testifies to the influence of Armstrong's theory.

Besides the so-called "translation" versions of Mind-Brain Type Identity advanced by Place, Smart, and Armstrong, according to which our mental concepts are first supposed to be translated into topic-neutral language, and the related version put forward by Feigl, there are also "disappearance" (or "replacement") versions. As initially outlined by Paul Feyerabend in 1963, this kind of Identity Theory actually favors doing away with our present mental concepts. The primary motivation for such a radical proposal is as follows: logically representing the identity relation between mental states and physical states by means of biconditional "bridge laws" (e.g., something is a pain if and only if it's a c-fiber excitation) not only implies that mental states have physical features; "it also seems to imply (if read from the right to the left) that some physical events...have non-physical features." In order to avoid this apparent dualism of properties, Feyerabend stressed the incompatibility of our mental concepts with empirical discoveries (including projected ones), and proposed a *redefinition* of our existent mental terms. Different philosophers took this proposal to imply different things. Some advocated a wholesale scrapping of our ordinary language descriptions of mental states, such that, down the road, people might develop a whole new (and vastly more accurate) vocabulary to describe their own and others' states of mind. This begs the question, of course, what such a new-and-improved vocabulary would look like. Others took a more theoretical/conservative line, arguing that our familiar ways of describing mental states could *in principle* be replaced by some very different (and again, vastly more accurate) set of terms and concepts, but that these new terms and concepts would not--at least not necessarily--be expected to become part of ordinary language. Responding to Feyerabend,

a number of philosophers expressed concern about the appropriateness of classifying disappearance versions as theories of Mind-Brain Type *Identity*. But in a 1965 paper, Richard Rorty answered this concern, arguing that there is nothing wrong with claiming that "what people *now* call 'sensations' are (identical with) certain brain processes." Two years later, in his Postscript to "The 'Mental' and the 'Physical'," Feigl confessed an attraction to this version of the Identity Theory, and over the years Smart has moved in the same direction.

II. TRADITIONAL OBJECTIONS

A number of objections to Mind-Brain Type Identity, some a great deal stronger than others, began circulating soon after the publication of Smart's 1959 article. Perhaps the weakest were those of the epistemological variety. It has been claimed, for example, that because people have had (and still *do* have) knowledge of specific mental states while remaining ignorant as to the physical states with which they are correlated, the former could not possibly be identical with the latter. The obvious response to this type of objection is to call attention to the *contingent* nature of the proposed identities-- of course we have different conceptions of mental states and their correlated brain states, or no conception of the latter at all, but that is just because (as Feigl made perfectly clear) the language we use to describe them have different meanings. The contingency of mind-brain identity relations also serves to answer the objection that since presently accepted correlations may very well be empirically invalidated in the future, mental states and brain states should not be viewed as identical.

A more serious objection to Mind-Brain Type Identity, one that to this day has not been satisfactorily resolved, concerns various *non-intensional* properties of mental states (on the one hand), and physical states (on the other). After-images, for example, may be green or purple in color, but nobody could reasonably claim that states of the brain are green or purple. And conversely, while brain states may be spatially located with a fair degree of accuracy, it has traditionally been assumed that mental states are non-spatial. The problem generated by examples such as these is that they appear to constitute violations of Leibniz's Law, which states that if A is identical with B, then A and B must be indiscernible in the sense of having in common all of their (non-intensional) properties. We have already seen how Place chose to respond to this type of objection, at least insofar as it concerns conscious experiences-- that is, by invoking the so-called "phenomenological fallacy." Smart's response was to reiterate the point that mental terms and physical terms have different meanings, while adding the somewhat ambiguous remark that neither do they have the same *logic*. Lastly, Smart claimed that if his hypothesis about sensations being brain processes turns out to be correct, "we may easily adopt a convention...whereby it would make sense to talk of an experience in terms appropriate to physical processes" (the similarity to Feyerabend's disappearance version of Mind-Brain Type Identity should be apparent here). As for apparent discrepancies going in the other direction (e.g., the spatiality of brain states vs. the non-spatiality of mental states), Thomas Nagel in 1965 proposed a means of sidestepping any objections by redefining the candidates for identity: "if the two sides of the identity are not a sensation and a brain process but my *having* a certain sensation or thought and my body's *being* in a certain physical state, then they will both be going on in the same place-- namely, wherever I (and my body) happen to be." Suffice to say, opponents of Mind-Brain Type Identity found Nagel's suggestion unappealing.

The last traditional objection we shall look at concerns the phenomenon of "first-person authority"; that is, the apparent incorrigibility of introspective reports of thoughts and sensations. If I report the occurrence of a pain in my leg, then (the story goes) I must have a pain in my leg. Since the same cannot be said for reports of brain processes, which are always open to question, it might look like we have here another violation of Leibniz's Law. But the real import of this discrepancy concerns the purported correlations between mental states and brain states. What are we to make of cases in which the report of a brain scientist contradicts the introspective report, say, of someone claiming to be in pain? Is the brain scientist always wrong? Smart's initial response to Kurt Baier, who asked this question in a 1962 article, was to deny the likelihood that such a state of affairs would ever come about. But he also put forward another suggestion, namely, that "not even sincere reports of immediate experience can be absolutely incorrigible." A lot of weight falls on the word "absolutely" here, for if the incorrigibility of introspective reports is qualified too strongly, then, as C.V. Borst noted in 1970, "it is somewhat difficult to see how the required psycho-physical correlations could ever be set up at all."

III. TYPE VS. TOKEN IDENTITY

Something here needs to be said about the difference between Type Identity and Token Identity, as this difference gets manifested in the ontological commitments implicit in various Mind-Brain Identity theses. Nagel was one of the first to distinguish between "general" and "particular" identities in the context of the mind-body problem; this distinction was picked up by Charles Taylor, who wrote in 1967 that "the failure of [general] correlations...would still allow us to look for particular identities, holding not between, say, a yellow after-image and a certain type of brain process in general, but between a particular occurrence of this yellow after-image and a particular occurrence of a brain process." In contemporary parlance: when asking whether mental things are the same as physical things, or distinct from them, one must be clear as to whether the question applies to concrete particulars (e.g., individual instances of pain occurring in particular subjects at particular times) or to the *kind* (of state or event) under which such concrete particulars fall.

Token Identity theories hold that every concrete particular falling under a mental kind can be identified with some physical (perhaps neurophysiological) happening or other: instances of pain, for example, are taken to be not only instances of a mental state (e.g., pain), but instances of some physical state as well (say, c-fiber excitation). Token Identity is weaker than *Type* Identity, which goes so far as to claim that mental kinds *themselves* are physical kinds. As Jerry Fodor pointed out in 1974, Token Identity is entailed by, but does not entail, Type Identity. The former is entailed by the latter because if mental kinds themselves are physical kinds, then each individual instance of a mental kind will also be an individual instance of a physical kind. The former does not entail the latter, however, because even if a concrete particular falls under both a mental kind and a physical kind, this contingent fact "does not guarantee the identity of the kinds whose instantiation constitutes the concrete particulars."

So the Identity Theory, taken as a theory of types rather than tokens, must make some claim to the effect that mental states such as pain (and not just individual instances of pain) are contingently identical with--and therefore theoretically reducible to--physical states such as c-fiber excitation. Depending on the desired strength and scope of mind-brain identity, however, there are

various ways of refining this claim.

IV. MULTIPLE REALIZABILITY

In his 1967 paper, "The Nature of Mental States," Hilary Putnam introduced what is widely considered the most damaging objection to theories of Mind-Brain Type Identity-- indeed, the objection which effectively retired such theories from their privileged position in modern debates concerning the relationship between mind and body. Putnam's argument can be paraphrased as follows: (1) according to the Mind-Brain Type Identity theorist (at least post-Armstrong), for every mental state there is a unique physical-chemical state of the brain such that a life-form can be in that mental state if and only if it is in that physical state. (2) It seems quite plausible to hold, as an empirical hypothesis, that physically possible life-forms can be in the same mental state without having brains in the same unique physical-chemical state. (3) Therefore, it is highly unlikely that the Mind-Brain Type Identity theorist is correct.

In support of the second premise above--the so-called "multiple realizability" hypothesis--Putnam raised the following point: we have good reason to suppose that somewhere in the universe--perhaps on earth, perhaps only in scientific theory (or fiction)--there is a physically possible life-form capable of being in mental state X (e.g., capable of feeling pain) *without* being in physical-chemical brain state Y (that is, *without* being in the same physical-chemical brain state correlated with pain in mammals). To follow just one line of thought (advanced by Ned Block and Jerry Fodor in 1972), assuming that the Darwinian doctrine of evolutionary convergence applies to psychology as well as behavior, "psychological similarities across species may often reflect convergent environmental selection rather than underlying physiological similarities." Other empirically verifiable phenomena, such as the plasticity of the brain, also lend support to Putnam's argument against Type Identity. It is important to note, however, that *Token* Identity theories are fully consistent with the multiple realizability of mental states.

V. ATTEMPTS AT SALVAGING TYPE IDENTITY

Since the publication of Putnam's paper, a number of philosophers have tried to save Mind-Brain Type Identity from the philosophical scrapheap by making it fit somehow with the claim that the same mental states are capable of being realized in a wide variety of life-forms and physical structures. Two strategies in particular warrant examination here.

In a 1969 review of "The Nature of Mental States," David Lewis attacked Putnam for targeting his argument against a straw man. According to Lewis, "a reasonable brain-state theorist would anticipate that pain might well be one brain state in the case of men, and some other brain (or non-brain) state in the case of mollusks. It might even be one brain state in the case of Putnam, another in the case of Lewis." But it is not so clear (in fact it is doubtful) that Lewis' appeal to "tacit relativity to context" will succeed in rendering Type Identity compatible with the multiple realizability of mental states. Although Putnam does not consider the possibility of *species-specific* multiple realization resulting from such phenomena as injury compensation, congenital defects, mutation, developmental plasticity, and, theoretically, prosthetic brain surgery, neither does he say anything to rule them out. And this is not surprising. As early as 1960, Identity theorists such as

Stephen Pepper were acknowledging the existence of species (even *system*)-specific multiple realizability due to emergencies, accidents, injuries, and the like: "it is not...necessary that the [psychophysical] correlation should be restricted to areas of strict localization. One area of the brain could take over the function of another area of the brain that has been injured." Admittedly, some of the phenomena listed above tell against Lewis' objection more than others; nevertheless, *prima facie* there seems no good reason to deny the possibility of species-specific multiple realization.

In a desperate attempt at invalidating the conclusion of Putnam's argument, the brain-state theorist can undoubtedly come up with additional restrictions to impose upon the first premise, e.g., with respect to time. This is the strategy of David Braddon-Mitchell and Frank Jackson, who wrote in a 1996 book that "there is...a better way to respond to the multiple realizability point [than to advocate token identity]. It is to retain a type-type mind-brain identity theory, but allow that that the identities between mental types and brain types may--indeed, most likely will--need to be restricted. ...Identity statements need to include an explicit temporal restriction." Mental states such as pain may not be identical with, say, c-fiber excitation in humans (because of species-specific multiple realization), but--the story goes--they could very well be identical with c-fiber excitation in humans *at time T*. The danger in such an approach, besides its *ad hoc* nature, is that the type physicalist basis from which the Identity Theorist begins starts slipping into something closer to token physicalism (recall that concrete particulars are individual instances occurring in particular subjects at particular *times*). At the very least, Mind-Brain Type Identity will wind up so weak as to be inadequate as an account of the nature of mental.

Another popular strategy for preserving Type Identity in the face of multiple realization is to allow for the existence of *disjunctive* physical kinds. By defining types of physical states in terms of disjunctions of two or more physical "realizers," the correlation of one such realizer with a particular (type) mental state is sufficient. The search for species- or system-specific identities is thereby rendered unnecessary, as mental states such as pain could eventually be identified with the (potentially infinite) disjunctive physical state of, say, c-fiber excitation (in humans), d-fiber excitation (in mollusks), and e-network state (in a robot). In "The Nature of Mental States," Putnam dismisses the disjunctive strategy out of hand, without saying why he thinks the physical-chemical brain states to be posited in identity claims must be uniquely specifiable. Fodor (in 1974) and Jaegwon Kim (eighteen years later), both former students of Putnam, tried coming to his rescue by producing independent arguments which purport to show that disjunctions of physical realizers cannot *themselves* be kinds. Whereas Fodor concluded that "reductionism...flies in the face of the facts," however, Kim concluded that psychology is open to sundering "by being multiply locally reduced."

Even if disjunctive physical kinds *are* allowed, it may be argued that the strategy in question *still* cannot save Type Identity from considerations of multiple realizability. Assume that all of the possible physical realizers for some mental state M are represented by the ideal, perhaps infinite, disjunctive physical state P; then it could never be the case that a physically possible life-form is in M and not in P. Nevertheless, we have good reason to think that some physically possible life-form could be in P *without* being in M-- maybe P in that life-form realizes some *other* mental state. As Block and Fodor have argued, "it seems plausible that practically any type of physical state could realize any type of psychological state in some physical system or other." The doctrine of "neurological equipotentiality" advanced by renowned physiological psychologist Karl Lashley,

according to which given neural structures underlie a whole slew of psychological functions depending upon the character of the activities engaged in, bears out this hypothesis. The obvious way for the committed Identity theorist to deal with this problem--by placing disjunctions of potentially infinite length on either side of a biconditional sign--would render largely uninformative any so-called "identity" claim. Just how uninformative depends on the size of the disjunctions (the more disjuncts, the less informative). Infinitely long disjunctions would render the identity claim *completely* uninformative. The only thing an Identity Theory of this kind could tell us is that *at least one* of the mental disjuncts is capable of being realized by *at least one* of the physical disjuncts. Physicalism would survive, but barely, and in a distinctly non-reductive form.

Recently, however, Ronald Endicott has presented compelling considerations which tell against the above argument. There, physical states are taken in isolation of their context. But it is only if the context is *varied* that Block and Fodor's remark will come out true. Otherwise, mental states would not be *determined* by physical states, a situation which contradicts the widely accepted (in contemporary philosophy of mind) "supervenience principle": no mental difference without a physical difference. A defender of disjunctive physical kinds can thus claim that M is identical with some ideal disjunction of complex physical properties like "C1 & P1," whose disjuncts are conjunctions of all the physical states (Ps) plus their contexts (Cs) which give rise to M. So while "some physically possible life-form could be in *P* without being in M," no physically possible life-form could be in *C1 & P1* without being in M. Whether Endicott's considerations constitute a sufficient defense of the disjunctive strategy is still open to debate. But one thing is clear-- in the face of numerous and weighty objections, Mind-Brain Type Identity (in one form or another) remains viable as a theory of mind-body relations.

Monism

The term *monism* was first used by Christian Wolff in his discussions of the mind-body problem to depict both philosophers who would only acknowledge the mind (idealism or mentalism) and philosophers who only acknowledged the body (materialism). The meaning Wolff originally intended by using the term has broadened in scope through the centuries, and today applies to any doctrine or theory that claims that all things, no matter how many or of what variety, can be reduced to one unified thing in time, space, or quality. Monistic philosophers including Parmenides, Democritus, Spinoza, Berkeley, Hume, Hegel, and proponents of contemporary atomic theory. The denial of *monism* forces commitment to either *dualism* or *pluralism*.

Monists take different views about how many substances exist. Substantial monists, such as Spinoza, maintain that everything is part of a single substance. Attributive monists maintain that, although there may be many distinct substances, they are all attributes of one type of stuff. Other doctrines are classified as types of monism. These include *neutral monism*, *idealism*, *traditional materialism*, and *partial monism*. *Traditional materialism* is the variety of *monism* which sees that everything is based in the material and physical. Hobbes subscribed to this view. *Neutral monism*, a doctrine of Hume, Russell, and Mach, denies that reality is based in neither the physical nor the mental, but rather in one particular kind of substance that can be classified as *neutral stuff*. *Phenomenalism*, in most instances, is classified under *neutral monism*. *Idealism* is the form of *monism* which maintains that everything is based in the mental. The two philosophers most closely associated with *idealism* were Berkeley and Hegel, the latter's version bases everything in and on the World Spirit. *Partial monism* holds that if there are many realms of being, then there is still only one substance within one of the realms upon which everything is based. Descartes is a half-subscriber to this form of *monism*; he accepted this theory as far as matter was concerned, but rejected it when it was applied to the mind.

Moral Dilemmas

A moral dilemma involves a situation in which the agent has only two courses of action available, and each requires performing a morally impermissible action. Plato presents the classic example of a moral dilemma. A man borrows a weapon from his neighbor promising to return it at his neighbor's request. One day the neighbor, in a fit of rage, asks for the weapon back apparently with the intention to kill someone. The man is faced with a dilemma: if he keeps his promise, then he will be an accessory to a murder; if he refuses to hand over the weapon, then he violates his promise. A moral dilemma, then, is a situation involving a choice between two opposing courses of action, where there are moral considerations in support of each course of action. Few would doubt whether we are in fact faced with difficult moral choices. The question raised by philosophers, though, is whether such dilemmas can be systematically resolved, or whether no systematic solution is available.

Defenders of dilemma resolution argue that only one of the courses of action can be our true obligation. For, it is not possible for an agent to perform both actions at the same time, and, hence, the agent cannot be obligated by both. Therefore, if the notion of obligation is to make sense, there must be a systematic way of determining which of the two courses of action represents our true obligation. Strictly speaking, then, genuine moral dilemmas do not exist, since all apparent moral conflicts can be systematically resolved. W.D. Ross argues for this view in *The Right and the Good*. For Ross, Each of our obligations is *prima facie*, that is, valid on face value until overridden by a stronger obligation. Once overridden, it is no longer obligatory.

From the other camp, critics of dilemma resolution argue that either choice may be acceptable and may represent our obligation. Our actual moral experience suggests that many conflicting moral choices simply are not capable of systematic resolution. Our moral decisions are often only a toss up between two courses of action. Strictly speaking, then, genuine moral dilemmas do exist because either choice could be the agent's true duty (depending on her decision).

There are important implications to the stand one takes on the possibility of systematically resolving moral dilemmas. First, if one denies that dilemmas can be resolved (the second option above), then the notion of absolute obligation is brought into question. For, in each particular dilemma, neither obligation will be absolute since neither will have priority. Further, it is theoretically possible that any obligation could conflict with at least one other obligation. Hence, none of our obligations would be absolute. This also suggests moral relativism, since the choice of action will be based on individual preference, and not on objective considerations. Second, if one argues the opposite view that conflicting obligations can be systematically resolved, then it must show how such resolution would be done. That is, a given normative moral theory must be designed to demonstrate that one course of action is objectively preferable to another. But many normative theories cannot live up to this task.

The most commonly suggested method of resolving conflicts between obligations is to appeal to the

highest intrinsic good. A thing is intrinsically good when it is valued for itself, and not merely as an instrument or means to some further end. Money is instrumentally good since it only provides a means to some further good, such as the purchase of a sports car. Music, on the other hand, is thought to be intrinsically good since it is valued for itself, and not as a means to something else. Moral philosophers are concerned with uncovering the highest intrinsic good -- that which is at the apex of everything that is valued. Human happiness is a common candidate for the highest intrinsic good since everyone strives for happiness, and happiness appears to be final goal of all our actions. Other nominees for the highest intrinsic good are pleasure, human rationality, God's will, free human choice, and highly evolved conduct.

Theoretically, if we can determine that pleasure, for example, is the highest intrinsic good, then conflicts between moral obligations would be resolved by determining which course of action produces the most pleasure. Similarly, if God's will is determined to be the highest intrinsic good, priority would be given to those actions which are most in accord with God's will. Thus, by locating the highest intrinsic good, moral dilemmas are resolved by appealing to that concept.

Moral Luck

Moral Luck: A case of moral luck occurs whenever luck makes a moral difference. The problem of moral luck arises from a clash between the apparently widely held intuition that cases of moral luck should not occur with the fact that it is arguably impossible to prevent such cases from arising.

The literature on moral luck began in earnest in the wake of papers by Thomas Nagel and Bernard Williams.[1] Though Nagel's paper was written as a commentary on Williams', they have quite different emphases.[2] Still, the same question lies at the heart of both papers and, indeed, at the heart of the literature on moral luck: can luck ever make a moral difference? This idea of a moral difference is a wide one. Various sorts of difference have been considered. The most obvious is, perhaps, a difference in what a person is morally responsible for, but it has also been suggested both that luck affects the moral justification of our actions and that it affects a person's moral status in general (that is, that it affects how morally good or bad a person is). We shall pay more attention to these varied differences in time, but the important point for now is that both Williams and Nagel argue that luck can make a moral difference. So what? The problem is that the idea of luck making a moral difference is deeply counterintuitive. We know that luck enters into our lives in countless ways. It affects our success and our happiness. We might well think, however, that morality is the one arena in which luck has no power, that when it comes to a person's moral standing (an expression I will use to stand for all the sorts of moral difference luck might be thought to make), her standing is exactly the one she deserves. Luck, we might think, cannot alter that standing one bit. This seems a reasonable position, but it is a position both Nagel and Williams cast into doubt. We will first consider Williams' argument, primarily because it is the least successful. I will suggest that Williams' argument fails and that what is interesting in his argument is captured much better by Nagel.

1. WILLIAMS ON MORAL LUCK

Williams' aim in "Moral Luck" and much of his other work is to discredit the Kantian view of morality and to suggest that it would be best to abandon the notion of morality altogether (replacing it with the wider notion he calls the 'ethical'). (See Williams, 1985, for the distinction.) In doing so, Williams takes himself to be challenging not just Kantian thinking about morality, but also commonplace ideas about it. He claims the idea that morality is immune to luck is "basic to our ideas of morality." (Williams, 1993a, 36) Why should this be so? Because, Williams suggests, if moral value does depend on luck it cannot be the sort of thing we think it is. I have already noted the extent to which luck permeates our lives. Some are born healthy; others with various sorts of handicaps. Some stumble into great wealth; others work hard, but always remain poor. To those on the losing end of these matters, this often seems unfair. Success of whatever kind we might seek is not equally available to all. Luck gives some head starts and holds others back. Nonetheless, we might think there is at least one sort of value which is equally available to all: moral value. Bill

Gates may be richer than me, but that does not mean he is a better person. Donovan Bailey may be faster than me, but that does not make him my moral superior. Of course, both these men *may* be my moral superiors, but, if they are, luck is supposed to have nothing to do with it. Morality thus provides us with a sort of comfort. In Williams' words, it offers "solace to a sense of the world's unfairness." (Williams, 1993a, 36) As Williams points out, however, this will be cold comfort if morality doesn't matter much. Thus, just as it is essential to the notion of moral value that it is immune to luck, so, he claims, it is essential that moral value is the supreme sort of value. Williams claims that if moral value really does possess these two characteristics, it can give us the solace he describes. Luck may bring us all sorts of hardship, but when it comes to the single most important sort of value, we are immune to luck. It is against this picture of morality that Williams' argument must be understood. He presents us with a dilemma: either moral value is (sometimes) a matter of luck or else it is not the supreme sort of value. In either case, we have to give up something very important to the notion of moral value, hence Williams thinks we should give up morality in favour of the ethical.

Williams begins the drive towards this dilemma by focusing on rational justification rather than moral justification. The cornerstone of his argument is the claim that rational justification is a matter of luck to some extent. He uses a thought experiment to make this point. Williams presents us with a story based loosely on the life of the painter Paul Gauguin. Williams' Gauguin feels some responsibility towards his family and is reasonably happy living with them, but nonetheless abandons them, leaving them in dire straits. He does so in an attempt to become a great painter. He goes to live on a South Sea Island, believing that living in a more primitive environment will allow him to develop his gifts as a painter more fully. How can we tell whether Gauguin's decision to do this is rationally justified? We should ask first of all, what exactly Williams means by rational justification. He never says, but I take it he is interested in the question of whether Gauguin was epistemically justified in thinking that acting as he did would increase his chances of becoming a great painter. That is, the question is whether it was rational (given Gauguin's interests) for him to do as he did.

Williams rightly observes that it is effectively impossible to foresee whether Gauguin will succeed in his attempt to become a great painter. Even if, prior to making his decision, Gauguin had good reason to think he had considerable artistic talent, he could not be sure what would come of that talent, nor whether the decision to leave his family would help or hinder the development of that talent. In the end, says Williams, "the only thing that will justify his choice will be success itself." (Williams, 1993a, 38) Similarly, Williams claims the only thing that could show Gauguin to be rationally unjustified is failure. Since success depends, to some extent anyway, on luck, Williams' claim entails that rational justification depends, at least in some cases, on luck. Not every success, however, confers justification, nor does every failure signal lack of justification. It depends on what sort of luck, if any, was involved in the success or failure. Williams distinguishes between extrinsic and intrinsic luck, claiming that only the operation of intrinsic luck is compatible with the result of a decision determining the rational justification of that decision. Roughly, intrinsic luck is luck which arises from the elements of the project or action under consideration, while extrinsic luck is luck arising from 'outside' the project. In the case of Gauguin, intrinsic luck is luck arising from Gauguin himself, since he is the only one involved in his project. If Gauguin fails because it turns out that living on a South Sea Island distracts him to such an extent that he becomes a worse painter, this will be a case of bad intrinsic luck and so he will be unjustified. On the other hand, if, at the start of his project, a freak accident causes him to sustain an injury which prevents him

from ever painting again, he will be neither justified nor unjustified since his project is never really carried out. His project will have failed but, as regards justification, a verdict will not be returned due to the interference of extrinsic bad luck.[3] What matters then with regard to rational justification is intrinsic luck. If Gauguin is lucky enough to possess sufficient talent and to find circumstances in which that talent can flourish, his project will succeed. He will be justified and this will, in part, be due to (intrinsic) luck. What, if anything, does this have to do with morality? Williams hopes to inflict fatal damage on the notion of the moral by setting up a collision between rational and moral justification. Rational justification, Williams has suggested, is, at least partly, a matter of luck. Moral justification, as we have noted, is not supposed to be a matter of luck at all. This clearly leaves room for clashes between the two sorts of justification, cases in which an action is morally unjustified, but rationally justified (or vice versa). Indeed, the example of Gauguin is supposed to provide us with just such a case. Suppose that Gauguin's decision to leave his family is morally unjustified. Since luck has nothing to do with the moral value of this decision, we can say that Gauguin's decision is a morally bad one when he makes it and that it stays that way forever, regardless of how his project turns out. According to Williams, however, whether Gauguin's decision is rationally justified is not settled when he makes it. We have to wait and see how the project turns out. Suppose, as Williams clearly means us to, that his Gauguin, like the real one, becomes a great artist (and that this does not happen as the result of extrinsic luck). Once this is the case, Gauguin's decision is rationally justified though still morally unjustified.

This might be thought enough to generate a problem for the type of morality Williams opposes. As Judith Andre puts it:

> **Since rational justification is partly a matter of luck, ... our notion of rational justification is not synonymous with that of moral justification, and morality is not the unique source of value (Andre, 1993, 123)**

This doesn't, however, quite get Williams' point right. His claim was not that morality is the only source of value, but that it is the supreme source of value. On this picture, the mere fact that morality and rationality collide does not necessarily pose a problem. The possibility that rationality and morality may be distinct sources of value is no more troubling than the fact that morality and pleasure are distinct sources of value. There can be more than one source of value so long as moral value trumps these others sorts of value.[4] Problems only arise when we come to consider "where we place our gratitude" that Gauguin left his family and became a painter. (Williams, 1993b, 255) Suppose that we are genuinely grateful that Gauguin did what he did and, as a result, became a great artist. We might say this shows that, on occasion, we have reason to be glad that the morally correct thing did not happen. But to say something like this is to call into question part of the point of morality (or so Williams says). Remember Williams claims that morality "has an ultimate form of justice at its heart, and that that is its allure. ... it offers ... solace to a sense of the world's unfairness." (Williams, 1993a, 36) He adds that it can offer that solace only if moral value possesses "some special, indeed supreme, kind of dignity or importance." (Williams, 1993a, 36) Thus, the problem posed by the Gauguin case is not simply, as Andre suggests, that there might be other sources of value than morality floating around. The problem is that the example of Gauguin suggests morality is not the *supreme* source of value after all. We are supposedly stuck between two unpalatable options. If the picture is as Williams describes it, we are in a situation in which moral value and another value (i.e., rationality) clash and the other value is the winner. So much the worse for morality, it loses its position as the supreme sort of value to a sort of value which is

affected by luck.[5] In doing so, its ability to provide us with 'solace to a sense of the world's unfairness' is destroyed. This problem can be avoided by claiming that morality and rationality do not collide in this case. That is, we could declare that morality is dependent on luck in the same way that rationality is. This sort of move will eliminate the threat that rationality poses to morality's supremacy, but this occurs at the expense of one of our deep commitments about morality, namely its invulnerability to luck. Either way, the notion of morality fails to escape intact.

This, anyway, is what Williams would have us believe. Despite all the attention that Williams' article has generated, his argument is actually remarkably unimpressive. It is not clear, for instance, that moral value has to be the supreme sort of value. Why can't it just be an important sort of value (and, according to what value are the various sorts of value to be ranked anyway)? Moreover, what is there to stop us from saying that our gratitude (if we have any) that Gauguin did what he did is just misguided and so that this is not a case in which it is better that the rational thing rather than the moral thing happened? It may be that our gratitude is no indicator of whether or not it is better that Gauguin did as he did. These large problems aside, there is an even more basic problem with Williams' argument. It rests on a claim about rational justification that can quite easily be made to look doubtful. At the heart of Williams' argument is the claim that a rational justification for a particular decision can only be given after the fact. This is what allows luck to enter into rational justification. If we do not accept this claim, Williams has given us no reason to think that either rational or moral justification is a matter of luck and so we cease to have a reason to imagine a conflict between rationality and morality (on these grounds anyway). If so, Williams has given us no reason to think that either rational or moral justification is a matter of luck. What's more, there is good reason to doubt the claim that rational justification must sometimes be retrospective. The usual intuition about justification is that if we want to know whether Gauguin's decision to leave his family and become a painter was a rational one, what we need to consider is the information Gauguin had available to him *when he made that decision*. What did he have reason to believe would be the fate of his family? What indication did he have that he had the potential to become a great painter? Did he have good reason to think his family would hinder his quest after greatness? Did he have reason to believe a move to the South Seas would help him achieve his goal? And so on. Our standard picture of justification tells us that, regardless of how things turned out, the answer to the question about Gauguin's justification is to be found in the answers to the above questions. Luck is thought to have nothing to do with his justification. Indeed, if Gauguin is found to have been somehow relying on luck -- if, for example, he had never painted anything, but just somehow felt he had greatness in him -- this would weigh substantially against the rationality of his decision. The same could be said of the moral status of his decision: what counts is the information he had at the time, not how things turned out.[6,7]

Williams does have an argument against this picture of justification, albeit an ineffective one. He appeals to the notion of agent regret. Agent regret is a species of regret a person can feel only towards his or her own actions. It involves a 'taking on' of the responsibility for some action and the desire to make amends for it. Williams' example is of a lorry driver who "through no fault of his" runs over a small child. (Williams, 1993a, 43) He rightly says that the driver will feel a sort of regret at the death of this child that no one else will feel. The driver, after all, caused the child's death. Furthermore, we expect agent regret to be felt even in cases in which we do not think the agent was at fault. If we are satisfied that the driver could have done nothing else to prevent the child's death, we will try to console him by telling him this. But, as Williams observes, we would

think much less of the driver if he showed no regret at all, saying only 'It's a terrible thing that has happened, but I did everything I could to avoid it.' Williams suggests that a conception of rationality that does not involve retrospective justification has no room for agent regret and so is "an insane concept of rationality." (Williams, 1993a, 44) His worry is that if rationality is all a matter of what is the case when we make our decisions and leaves no room for the luck that finds its way into consequences, then the lorry driver ought not to experience agent regret, but instead should simply remind himself that he did all he could. This, however, just does not follow. The problem is that, in any plausible case of this sort, it will not be rational for the driver to believe that he could not have driven more safely. Driving just isn't like that. Indeed, what it is rational for the driver to do is to suspect there was something else he could have done which might have saved the life of the child. If he had just been a little more alert or driving a little closer to the centre of the road. If he had been driving a little more slowly. If he had seen the child playing near the street. If his brakes had been checked more recently and so on and so on. It will be rational for him to wonder whether he could have done more to avoid this tragedy and so rational for him feel a special sort of regret at the death of the child. (See Rosebury, 1995, 514-515 for this point.) Agent regret exists because we can almost never be sure we did 'everything we could'. Thus it provides us with no reason to believe there is a retrospective component to rational justification (and so no reason to conclude that luck plays the role in justification Williams suggests).

None of this is to deny that the way things turn out may figure in the justifications people *give* for their past actions. It is just that, despite this, the way things turn out has nothing to do with whether or not those past actions really were justified. Sometimes the way things turn out may be all we have to go on, but this tells us nothing about the actual justification or lack thereof of our actions, not unless we confuse the state of an action being justified with the activity of justifying that action after the fact.

Why then have Williams' claims about moral luck been taken so seriously? Because despite the shakiness of the argument he in fact gave, he pointed the way towards a much more interesting and troubling argument about moral luck. This argument, glimpses of which can be found in Williams' paper, is explicitly made in Thomas Nagel's response to Williams.

2. NAGEL ON MORAL LUCK

Nagel identifies the problem of moral luck as arising from a conflict between our practice and an intuition most of us share about morality. He states the intuition as follows:

> **Prior to reflection it is intuitively plausible that people cannot be morally assessed for what is not their fault, or for what is due to factors beyond their control. (Nagel, 1993, 58)**

He then gives us a rough definition of the phenomenon of moral luck:

> **Where a significant aspect of what someone does depends on factors beyond his control, yet we continue to treat him in that respect as an object of moral judgment, it can be called moral luck. (Nagel, 1993, 59)**

Clearly cases of moral luck fly in the face of the above stated intuition about morality.[8] Yet, Nagel claims that, despite our having this intuition, we frequently do make moral judgments about people based on factors that are not within their control. We might, for instance, judge a drunk driver who kills a child (call him the 'unfortunate driver') more harshly than one who does not (call him the 'fortunate driver'), even if the only significant difference between the two cases is that

a child happened to be playing on the road at the wrong point on the unfortunate driver's route home. This, for Nagel, is the problem of moral luck: the tension between the intuition that a person's moral standing cannot be affected by luck and the possibility that luck plays an important (perhaps even essential) role in determining a person's moral standing. Nagel suggests that the intuition is correct and lies at the heart of the notion of morality, but he also endorses the view that luck will inevitably influence a person's moral standing. This leads him to suspect there is a real paradox in the notion of morality.

We might wonder whether the problem Nagel presents is best thought of as a problem about luck or if it is really about control. That is, is Nagel's worry that *luck* seems to play a role in determining a person's moral standing or that *things which are beyond that person's control* seem to affect her moral standing? The answer is both. Nagel thinks that luck should be understood as operating where control is lacking, so for him the problem about control and the problem about luck are one and the same. The important point, however, is that Nagel seems to think that, quite aside from how luck is analyzed, there is a real problem if luck ever makes a moral difference. This is important because there is reason to think the identification of luck with lack of control is mistaken.[9] Even if this is so, we are left with a problem of moral luck. For this reason, it is in terms of luck rather than lack of control that I shall hereafter frame the problem.

The problem of moral luck lies in the thought that luck sometimes makes a moral difference, but, as I have noted, there is more than one way in which luck might make a moral difference. Two sorts of difference are discussed in the literature on moral luck, although these are not always clearly distinguished. These two sorts are represented, on one hand, by the thought that the unfortunate driver is no worse a person than the fortunate driver and, on the other, by the thought that since we cannot plausibly hold the fortunate driver responsible for the death of a child (as no death occurred in his case), neither can we hold the unfortunate driver morally responsible for that death. The second thought has to do with the assigning of individual events to a person. The first involves a more direct assessment of a person. It involves an assessment of how much credit or discredit -- I will use the term 'moral worth' to capture both credit and discredit -- attaches directly to a person.

We have two sorts of question to consider: (1) can luck make a difference in a person's moral worth and (2) can luck make a difference in what a person is morally responsible for? Which of these questions is Nagel's? It is difficult to tell. Nagel does briefly refer to the problem of moral luck as a "fundamental problem about moral responsibility," but most of the time his worries are about 'blame', a notion with overtones of both sorts of moral difference. (Nagel, 1993, 58) Is he concerned that the driver will be blamed *for the event* of the child's death or that the unlucky driver *himself* will be rated morally worse than the lucky driver, i.e., blamed more? Nagel seems to entertain both possibilities, asking both whether the unfortunate driver is to blame for more and whether he is a worse person than the unfortunate driver. Indeed, it may be the case that Nagel thinks the two questions are inseparable, that we cannot make sense of the idea of holding a person morally to blame for some event without this, at the same time, being counted as a reason to lower that person's moral credit rating. Nothing Nagel says clearly reveals his position on this point. For now, it is enough simply to bear both sorts of moral difference in mind. The important point is that, in either case, there is something troubling about the idea that luck might make a moral difference. Yet, it seems we allow luck into our moral judgments all the time. We *do* think less of the unfortunate driver. We *do* hold him responsible for the death of the child. On the face of it, this might not seem particularly troubling. We might admit that, on occasion, we judge people for

things that happen as a result of luck, but simply claim that in any such case a mistake has been made. The mere fact that we do sometimes judge people for things that happen due to luck does not indicate that we should judge people for things that happen due to luck nor that we intend to. The problem Nagel points out, however, is that when we consider the sorts of things that influence us "Ultimately, nothing or almost nothing about what a person does seems to be under his control." (Nagel, 1993, 59) That is, everything we do seems at some level to involve luck. Nagel makes a helpful comparison to the problem of epistemological skepticism. Just as the problem of skepticism emerges from the clash of our intuition that knowledge should be certain and non-accidental with the fact that few, if any, of our true beliefs are entirely certain or free from accident, so:

> **The erosion of moral judgment emerges not as the absurd consequence of an over-simple theory, but as a natural consequence of the ordinary idea of moral assessment, when it is applied in view of a more complete and precise account of the facts. (Nagel, 1993, 59)**

What are these facts? Nagel identifies four ways in which luck plays into our moral assessments. It enters through:

> **1) Constitutive Luck: the luck involved in a person's having the "inclinations, capacities and temperament" that she does.**
> **2) Circumstantial Luck: the luck involved in "the kind of problems and situations one faces"**
> **3) Causal Luck: "luck in how one is determined by antecedent circumstances."**
> **4) Resultant Luck: "luck in the way one's actions and projects turn out." (Nagel, 1993, 60)10**

Nagel gives illustrations of each type of luck. They are worth considering so that we might be clear on the differences between the types of luck. We should bear in mind, however, that we may ultimately disagree about whether these constitute cases of *moral* luck. This is something I will say more about shortly.

Resultant Luck:

Nagel gives us several examples of resultant luck. One we have already seen: the case of the fortunate and unfortunate drunk drivers. Nagel also makes much of decisions, particularly political ones, made under uncertainty. He gives the example of someone who must decide whether to instigate a revolution against a brutal regime. She knows that the revolution will be bloody and that, if it fails, those involved will be slaughtered and the regime will become even more brutal. She also knows that if no revolution occurs, the regime will become no less brutal than it currently is. If she succeeds she will be a hero, if she fails she will bear "some responsibility" for the terrible consequences of that failure. (Nagel, 1993, 61-62) Thus, how the revolution turns out, something which might be almost entirely a matter of resultant luck, seems to have a great deal to do with the moral credit or blame she will receive.11

Circumstantial Luck:

Just as luck may interfere in the course of our actions to produce results that have a profound influence on the way we are morally judged, so our luck in being in the right or wrong place at the right or wrong time can have a profound effect on the way we are morally assessed. Nagel's

example is of a person who lives in Germany during the Second World War and "behaves badly." (Nagel, 1993, 65) We are surely inclined to blame such a person, to hold him or her responsible for what he or she did. But Nagel asks us to contrast this person with a German who moves to Argentina shortly before the War for business reasons. Suppose that the expatriate would have behaved just as badly as the German if he had remained in Germany. Are we willing to say the expatriate should be judged as harshly as the German? If not, circumstantial luck has made a moral difference. We can make this sort of case more troubling if we focus on the way in which the person has 'behaved badly'. If the bad behaviour consists of being a concentration camp guard and gleefully shooting hundreds of people, we may be inclined to think of the expatriate, who would have behaved the same way given half a chance, as an undiscovered monster who rightly should be judged as harshly as the German.12 In such an extreme case, it is easy enough to claim that luck does not make a moral difference even if it makes a difference in whether we discover that the expatriate is so morally repellent. But, if the bad behaviour consists of something less drastic, say, in refusing to give refuge to a Jewish family being pursued by the Nazis, we can be much less confident that we would not have failed in the same way. Are we willing to say that all those of us who would have failed should be assessed in the same way as the German who actually failed? It is not at all clear that we are.

Causal Luck:

Nagel says very little about this sort of luck and the same is true of those who have written about moral luck after him. The worry about causal luck should be clear enough since it is precisely the sort of worry found in the debate on free will and determinism. It also seems to be a redundant sort of luck, included by Nagel only to indicate the connection between the problem of moral luck and the debate about free will and determinism. It is redundant because circumstantial and constitutive luck seem to cover the same territory. Constitutive luck covers what we are, while circumstantial luck covers what happens to us. Nothing else seems to remain that can play a role in determining what we do.

It is worth considering whether what I have just said about the relationship between the freewill versus determinism controversy and worries about causal luck might, as has sometimes been suggested, be applied to the whole problem of moral luck. Is the entire problem of moral luck nothing but the freewill and determinism problem in different clothing? It certainly does cover some of the same territory. Like worries about the compatibility of free will and determinism, worries about moral luck get their start when we notice how much of what is supposed to be morally significant about us is simply thrust upon us whether we like it or not. But while they cover some of the same territory, the notions upon which the problems turn are quite different. In particular, neither of the notions that get star billing in talk of freewill and determinism is of central concern when we think about moral luck. Given that luck may exist whether the world is deterministic or not, we do not worry about whether determinism is true or not when we consider the problem of moral luck.13 Nor, do we spend our time worrying about whether people possess freewill or not. This being so, it is best to think of the problem of moral luck as related to, but distinct from, the problem of freewill and determinism.

Constitutive Luck:

A natural reaction to worries about resultant and circumstantial luck is to suggest that what matters is not how a person's actions turn out or what circumstances they chance to encounter, but

what is in that person's 'heart'. We "pare each act down to its morally essential core, an inner act of pure will assessed by motive and intention." (Nagel, 1993, 63) To do so, however, is to open oneself up to worries about constitutive moral luck. If we focus on a person's character then what of the luck involved in determining what that person's character is? It may be that, in a given situation, you did not act with good intentions, but perhaps this was because you were unlucky enough to be born a bitter or spiteful person. Why then should your bad intentions figure in your blameworthiness? Nagel suggests they should not. He claims that we should not praise or condemn people for qualities that are not under the control of the will (and so not under their control). But as reasonable as this may sound, Nagel also claims we *cannot* refrain from making judgments about a person's moral status based upon just this sort of uncontrollable feature. If we did so refrain, it is not clear we would be able to make any judgments at all. In the end, people are assessed for what they are like, not for how they ended up that way.

The notion of constitutive luck illustrates the difficulty of the problem of moral luck. Our temptation is to avoid the other sorts of luck by focusing on what the person *really is*. In this way, we try to discount worries about the luck that affects the way our actions turn out or the luck that places us in situations in which we make unfortunate decisions. We focus on the core of the person, on his or her character. But on reaching that core, we are disappointed to find that luck has been at work there too. The trouble is that there is nowhere further to retreat when we are at the level of character. If we retreat further there is no person left to morally assess. Nagel concludes that "in a sense the problem has no solution." (Nagel, 1993, 68) The cost of not admitting the existence of moral luck is giving up the idea of agency. We seem driven to the conclusion that no one is blameworthy for anything. But the alternative is to preserve our notions of agency and responsibility by concluding that moral value is subject to luck.

3. RESPONSES TO THE PROBLEM

The problem of moral luck traps us between an intuition and a fact:[14]

> **1) the intuition that luck must not make moral differences (e.g., that luck must not affect a person's moral worth, that luck must not affect what a person is morally responsible for).**
> **2) the fact that luck does seem to make moral differences (e.g., we blame the unfortunate driver more than the fortunate driver).**

Responses to the problem have been of two broad sorts. Some claim that the intuition is mistaken, that there is nothing wrong with luck making a moral difference. Others claim that we have our facts wrong, that luck never does make a moral difference. The first sort of response has been the least popular. When it has been made, the approach has usually been to suggest that, if cases of moral luck are troubling, this is only because we have a mistaken view of morality. Brynmor Browne (1992), for instance, has argued that moral luck is only troubling because we mistakenly tend to think of moral assessment as bound up with punishment. He argues that, once we correct our thinking, cases of moral luck cease to be troubling. In an argument reminiscent of Williams, Margaret Urban Walker (1993) claims that cases of moral luck are only troubling if we adopt the mistaken view of agency she calls 'pure agency'. She argues that this view has repugnant implications and so should be rejected in favour a view of agency on which moral luck ceases to be troubling (namely 'impure agency'). Judith Andre (1993) claims that we find cases of moral luck troubling because some of our thinking about morality is influenced by Kant. She adds, however, that the core of our thinking about morality is Aristotelian and that Aristotelians need not be

troubled by cases of moral luck.15 The claims of all these authors are controversial.

The most popular response to the problem of moral luck has been to deny that cases of moral luck ever occur. This is usually done by suggesting that cases in which luck appears to make a moral difference are really cases in which luck makes an epistemic difference, that is, in which luck puts us in a better or worse position to assess a person's moral standing (without actually changing that standing). Consider the case of the fortunate and unfortunate drivers. On this line of argument, it is claimed that there is no moral difference between them, it is just that in the case of the unfortunate driver we have a clear indication of his deficient moral standing. The fortunate driver is lucky in the sense that his moral failings may escape detection, but not in actually having a moral standing any different from that of the unfortunate driver. Along these lines, we find passages like the following:

> **the luck involved relates not to our moral condition but only to our image: it relates not to what we are but to how people (ourselves included) will regard us. (Rescher, 1993, 154-5)**
>
> **A culprit may thus be lucky or unlucky in how clear his deserts are. (Richards, 1993, 169)**
>
> **if actual harm occurs, the agent and others considering his act will have a painful awareness of this harm. (Jensen, 1993, 136)**
>
> **the actual harm serves only to make vivid how wicked the behaviour was because of the danger it created. (Bennett, 1995, 59-60)**

While appealing, the difficulty with this response to the problem of moral luck is that it tends to work better for some sorts of luck than others. While it is plausible that resultant or circumstantial luck might make only epistemic differences, perhaps revealing or concealing a person's character, it is not at all clear that constitutive luck can be said to make only epistemic differences. If a person possesses a very dishonest character by luck, what feature of the person does luck reveals to us that (non-luckily) determines his moral status? One response to this worry has been to deny that the notion of constitutive luck is coherent. (See, in particular, Rescher, 1995, 155-158 and also Hurley, 1993, 197-198.) This claim turns upon a substantive claim about the nature of luck, a topic that has been surprisingly absent from the literature on moral luck. It is my own view that it is only by investigating the nature of luck that we will be able to reach any sort of a final conclusion regarding the problem of moral luck. My own conclusion, which I shall leave undefended here, is that such an investigation leads to the view that cases of moral luck are both inescapable and troubling. The problem of moral luck is both real and deep.

NOTES

1. I say 'in earnest' because the problem of moral luck had been discussed before Nagel's and Williams' articles (although not under the heading of 'moral luck'). See, for instance, Joel Feinberg (1962). [return to main text]

2. The papers, both entitled "Moral Luck," were originally published in *The Aristotelian Society Supplementary*, Volume 1, 1976. Revised versions of both papers were published as chapters of Williams (1981) and Nagel (1979). The revised versions of these papers are also included in an excellent anthology edited by Daniel Statman (1993). [return to main text]

3. Although Williams never mentions it, presumably if Gauguin were to succeed due to good extrinsic luck, he would also be neither justified nor unjustified. If an eccentric art critic were to find a way to make Gauguin's mediocre work speak, it might be impossible to tell whether Gauguin was justified or not. (The example was suggested to me by Arthur Ripstein.) [return to main text]

4. For the Kantian the problem is worse since, for Kant, to act morally is to act rationally. But remember that Williams takes as his enemy both Kantian and our everyday thinking about morality. It is not at all clear that our everyday thinking about morality requires us to endorse such a tight link between rationality and morality. [return to main text]

5. It is, however, possible to concede that morality is not the supreme source of value, but not give up the claim that our lives are, in some important respect, free of luck. Susan Mendus argues that, while the case of Gauguin shows that morality is not the supreme source of value, the only values which compete with morality for supremacy are themselves free from luck. In Gauguin's case, she claims that the value which competes with morality for supremacy is that of art and that even if Gauguin fails, "he has reason to think it worthwhile to have tried." (Mendus, 1988, 339) [return to main text]

6. I must admit that the 'standard picture' of justification I have sketched above is an internalist one. Such a picture is somewhat unfashionable amongst philosophers these days, although I would argue it is still our intuitive picture. Regardless, those favouring adding external considerations to an account of justification are no more inclined to factor in how things turn out than internalists. (See, for instance, Goldman, 1989) What matters to externalists is typically not how things do turn out, but how they are *likely* to turn out. [return to main text]

7. I should add that luck clearly can enter into rational justification in ways other than the one Williams has in mind. It can be a matter of luck that you are smart enough to see that the evidence

you possess justifies you in holding a certain belief or a matter of luck that you possess the evidence you do. Presumably luck can enter into moral justification in the same ways, but, with good reason, no one has ever suggested there is anything troubling about this. [return to main text]

8. Nagel (and many others) sometimes seem to attribute to Kant the position that luck could never make a moral difference. This is not so. In "On A Supposed Right to Lie from Altruistic Motives," Kant tells us that a person who lies to a murderer about the location of the murderer's intended victim thereby becomes responsible for whatever the murderer does (including things the murderer might do which could not have been foreseen). Since what the murderer actually does may be affected by luck, Kant clearly does allow the possibility that luck may affect what a person is responsible for. [return to main text]

9. The question of what luck is has been dealt with remarkably little in the literature on moral luck (see Rescher, 1995, for the beginnings of an account of luck). But even without an account of luck in hand, there is good reason to doubt that an event being lucky (or unlucky) for a given person is identical with that event being out of that person's control. An event can be out of my control (or, for that matter, anyone else's), yet still not such that we would say I am lucky that it occurred. An event such as the rising of the sun this morning was entirely out of my control, yet it is not at all clear that I am lucky the sun rose this morning (although it is surely a good thing that it did). Why? I suggest it is because, regardless of whether I had any control over the occurrence of that event, the chance of that event occurring was very good indeed. A successful account of luck must weave together these ideas about chance and control. [return to main text]

10. Nagel identifies, but does not give names to all four types of luck. He does write of 'constitutive luck,' an expression he probably gets from Williams. Williams, however, intends constitutive luck to have a wider scope than Nagel does. Williams appears to want constitutive luck to encompass what I have called 'circumstantial' and 'causal' luck. (Williams, 1993a, 36) I take the names 'circumstantial' and 'causal' luck from Daniel Statman. (Statman, 1993, 11) The term 'resultant luck' comes from Michael Zimmerman. (Zimmerman, 1993, 219) Other names have been given to resultant, circumstantial and causal luck. Resultant luck has been called 'consequential luck'. (Mendus, 1988, 334) Circumstantial luck has been called 'situational luck'. (Walker, 1993, 235) Causal luck has been called 'determining luck'. (Mendus, 1988, 334) [return to main text]

11. It is worth emphasizing again that Nagel means to suggest luck will affect not just what praise or blame she actually receives, but also, regardless of how she is actually treated, what praise or blame she deserves. [return to main text]

12. Obviously there would be huge epistemic obstacles to our ever discovering that the expatriate was such a monster, but that doesn't matter. We are not concerned here with how to find out how good or bad a person is. [return to main text]

13. Defending the claim that there are instances of luck even if determinism is true would require more space than I have here. The best I can do here is to give an example that suggests this is so. Suppose that determinism is true. Even if we were aware of this and so aware that it would have been possible in 1897 (or 1797 or ...) to correctly predict that X would win the lottery this weekend, I would suggest we would be no less inclined to say that X was lucky to win the lottery. [return to main text]

14. The problem of moral luck could equally well be presented as a conflict between intuitions. The fact that luck does seem to make moral differences would not be so troubling if we did not have the intuition that it is sometimes right that luck does this. I present the conflict as one between intuition and fact, partly because this is how Nagel presents it and partly because this seems the natural way to introduce it. We discover the problem when we notice how practices that, at first glance, seem right conflict with our intuition that luck should not make moral differences. **[return to main text]**

15. Martha Nussbaum's 1986 The *Fragility of Goodness* is an important work in which she considers Greek views towards luck and ethics. In particular, she presents Plato and Aristotle as disagreeing about whether a good life must be invulnerable to luck, arguing that for Plato it must, but for Aristotle it need not. Her views on these matters are controversial. She has been accused of reading too much Bernard Williams into Aristotle. See Farwell (1994), Irwin (1988) and Woodruff (1989) for helpful discussions of Nussbaum's book. **[return to main text]**

Moral Rationalism

The term "moral rationalism," in its broadest sense, applies to moral theories that emphasize the use of reason or a rational procedure in moral decision making. Most moral philosophers in the history of philosophy noted that human reason plays at least some part, often a dominant one. Plato argued that moral decision making involves a rational intuition of moral principles. Part of our rational faculty involves an intuitive sense by which we perceive abstract concepts that exist in a spirit-like realm. With this rational intuition we perceive moral principles, such as the notion of justice, the same way we rationally perceive basic mathematical truths, such as 2+2=4.

Aristotle held that we use reason to determine the best way to achieve the highest moral good. All people strive for happiness, and moral reasoning involves determining the best means for achieving that end. For example, if happiness is attained by being courageous, then my reason will tell me what actions I need to perform to be courageous, without being either too cowardly or too rash. Aristotle referred to this as practical reasoning since reason guides our actions (or practice). Medieval philosophers such as Aquinas suggested that we an innate rational faculty called *synderesis* that informs us of our highest moral obligation. Aquinas also argued that our reason plays a role in deducing secondary moral principles from primary ones, analogous to the way that theorems in geometry are deduced from more fundamental principles. For example, given the primary principle that "We ought to treat people benevolently," we can deduce the secondary principle that "We should help feed starving people," since feeding the starving is clearly an act of benevolence. If we then observe that Jones is starving, we can rationally deduce further that it is our obligation to help feed Jones.

In the 18th century moral philosophers such as Samuel Clarke and William Wollaston followed Plato's notion of moral reasoning and argued that morality involves a rational judgment about moral truths. Clarke, for example, argues that there exist three different classes of eternal relations. First, there are mathematical relations that involve concepts such as "less than," "greater than," or "equal to." If I state that "the height of my dog is less than the height of your horse," my statement is "fit" or "proportioned" to the ideal meaning of "less than." Second, there are religious relations, such as "infinite greatness." If I state that "God should be worshipped," then my statement is "fit" to the ideal meaning of "infinite greatness. Finally, there are eternal moral relations such as equality, promoting universal good, and helping others from danger. If you donate to charity, for example, then your action is "fit" to the notion of promoting universal good. If you steal, then your action is unfit to that moral relation. We judge the moral status of all of our actions based on these moral relations. Clarke argues further that all humans have self-evident knowledge of these relations, just as we have self-evident knowledge of mathematical and religious relations. Moral assessments, then, are purely rational.

18th century British philosopher David Hume challenged the longstanding view that morality involves a rational judgment. Hume argued that the role of reason in moral decisions is very

limited, and that moral approval is only a feeling in the mind of the person that makes a moral judgment. In Book 3 of his *Treatise of Human Nature* (1740) and *An Enquiry Concerning the Principles of Morals* (1751) Hume launches five distinct attacks against the view that moral pronouncements are judgments of reason. The first argument is based on the restrictive function of our rational faculty in general. Reason involves only judgments of about reality: either of facts we perceive through our five senses, or of abstract relations in mathematics and logic. When we closely examine the contents of any morally significant action, such as a murder, we will never locate a special moral fact or relation about which we can make a judgment. All we will find is our own feeling. Contrary to Clarke, even if such abstract moral standards exist, humans do not have the faculties to perceive that particular breed of abstract principles.

Secondly, Hume argues that moral pronouncements do not parallel logical and mathematical reasoning. In these disciplines, we begin with known facts, such as theorems, and deduce from these a new and previously unknown fact. But with moral pronouncements, all the relevant facts must be first known. Thirdly, moral pronouncements more closely parallel our aesthetic pronouncements about beauty, which are clearly feelings and not rational judgments. Fourthly, moral pronouncements cannot be judgments about relations since we find exactly the same abstract relations in both moral and nonmoral situations. Finally, moral pronouncements cannot be rational judgments, since all moral actions are done for the final and foundational purpose of happiness. And no final or foundational purpose can be accounted for by reason. Hume concludes his discussion in the Treatise noting that rationalist discussions of morality all begin with statements of fact, such as "Jones is starving," and then conclude with a statement of obligation, such as "We should help feed Jones." According to Hume, it is impossible to rationally deduce statements of obligation from statements of fact. This view of Hume's is encapsulated in the dictum that, "Ought cannot be derived from is."

Hume's critique of moral rationalism had a strong impact on subsequent moral theories. Although 18th and 19th century theorists were not as extreme as Hume in completely dismissing reason in favor of emotion, they nevertheless offered accounts of moral reasoning that differed substantially from Clarke's view. For example, German philosopher Immanuel argued that, although emotional factors indeed do influence our conduct, we should resist this kind of sway. Instead, true moral actions are freely motivated only by reason when emotions and desires do not influence it. Jeremy Bentham argued that we rationally calculate the consequences of our actions. Depending on whether the consequences are good or bad, these rational calculations will tell us whether the action is right or wrong. Following Hume's lead, early 20th century analytic philosophers offered a moral theory called *emotivism*, which rejected reason in favor of emotion. According to emotivists such as C.L. Stevenson, when we make moral utterances, a key part of our meaning is that we are both reporting and expressing our feelings. For example, when I say that "Jones is a good man," I am reporting that I approve of Jones, and also emotionally expressing approval such as "hooray for Jones!"

In reaction to emotivist theories, several philosophers have recently placed a new emphasis on the role of reason in a theory called best reasons morality. The most notable proponent of this view is Kurt Baier in *The Moral Point of View* (1958). According to Baier, moral decision making involves a search for the best reasons for or against a course of action. Moral reasoning, then, parallels legal reasoning that involves collecting relevant facts, weighing arguments on both sides of the issue, and then judging.

Moral Realism

Moral realism is the view that moral principles have an objective foundation, and are not based on subjective human convention. Perhaps the first and strongest defense of moral realism appears in the writings of Plato, specifically the first passage below from Book 6 of the Republic. In this passage -- one of the most influential passages in Western Philosophy -- Plato explains how the universe is divided into two realms: the visible realm of material things and the intelligible realm of the forms. Field of mathematics inspired Plato's view of the forms. When we look at numbers and mathematical relations, such as 1+1=2, they seem to be timeless concepts that never change, and apply everywhere in the universe. Humans don't invent numbers, and humans can't alter them. Plato explained the eternal character of mathematics by stating that they are abstract entities that exist in a spirit-like realm of the forms.

Although Plato's theory of the forms was endorsed by some medieval philosophers, other notions of moral realism emerged at this time, specifically in the theory of natural law. For Aquinas, morality is grounded in principles that are fixed in nature, particularly in natural purposes, and discernible through reason. All human laws are judged in reference to these. Moral realism was pushed to its limits by Eighteenth-century philosophers, such as Samuel Clarke, who developed a rigorous account of moral realism known as the eternal fitness theory. On this view, morality is founded on eternally fit principles that belong to a spirit-like world of abstract entities -- paralleling Plato's world of the forms. In that spirit world, ethical principles exist eternally along side mathematical truths. Contemporary discussions of moral realism focus on whether moral facts exist independently of people's beliefs and attitude, and whether moral judgments can be true or false.

Positions that oppose moral realism are moral skepticism, moral relativism, and noncognitivism.

The Internet Encyclopedia of Philosophy

Moral Relativism

Moral relativism, as opposed to other forms of relativism, is the view that moral standards are grounded only in social custom. The most famous statement of relativism in general is by the ancient Greek sophist Protagoras (480-411 BCE.): "Man is the measure of all things," or in a more complete and contemporary translation, "A human being is the measure of all things - of things that are, that they are, and of things that are not that they are not." This reflects the view of many of the sophists that social convention (nomos) has a status above nature (physis). Although Protagoras's claim applies to any proposed standard of knowledge, moral values are at least part of his position. David Hume (1711-1776) hints at the notion of moral relativism in his brief essay "A Dialogue," appended to his *Enquiry Concerning the Principles of Morals* (1751). However, for much of the history of moral philosophy, moral relativism was a controversial position that stood in sharp contrast to more conventional theories that advocated an ideal standard of absolute morality. At times, the notion of moral relativism was developed more by philosophical critics of relativism, rather than by overt philosophical defenders of relativism.

More recently, writers both inside and outside of the field of philosophy have advocated moral relativism. For example, anthropologist William Graham Sumner dramatically expresses the notion of moral relativism here:

> The "right" way is the way which the ancestors used and which has been handed down. The tradition is its own warrant. It is not held subject to verification by experience. The notion of right is in the folkways. It is not outside of them, of independent origin, and brought to test them. In the folkways, whatever is, is right. This is because they are traditional, and therefore contain in themselves the authority of the ancestral ghosts. When we come to the folkways we are at the end of our analysis. [Folkways (Boston: Ginn, 1906)]

Arguments for moral relativism often involve two principal contentions:

1. Primacy of De Facto Values: our conceptions of morality should be based on how people actually behave (de facto values), and not on an ideal standard how people should behave (ideal values).
2. Cultural Variation: in point of fact, our main moral values vary from culture to culture.

As to the first of these, moral relativists note that there are two ways that we can approach morality: as de facto morality or as ideal morality. De facto morality concerns they way people in fact behave, and involves the moral principles that are actually in place in a given culture. By contrast, ideal morality concerns the way people should behave, irrespective of their actual behavior.

Regarding the second of the above claims, moral relativists emphasize the variation in values that we see in cultures around us. It is indisputable that some values vary from culture to culture, such as wearing

clothes, child marriages, and eating the bodies of dead relatives. Although many of these values are more like rules of etiquette than rules of morality, it is clear that at least some important moral values vary from culture to culture. For example, in Mainland China, abortion is recognized as an important tool for population control. In the Republic of Ireland, though, abortions are not readily available even when the life of a mother is at risk. But moral relativists defend an even stronger claim that our main moral values vary in at least some cultures. According to many relativists, then, moral standards of different cultures are like isolated islands of values, each of which gains its justification through the social customs of that particular culture.

Critics of moral relativism sometimes challenge the idea of cultural variation, defined above. For example in *Elements of Moral Philosophy* James Rachels attacks moral relativism arguing that there is in fact a core set of values that are common to all societies and are in fact necessary for any society to exist. These values are (1) we should care for children, (2) we should tell the truth, and (3) we should not murder. Critics also point out problems of consistency with moral relativism. For example, if moral relativism is true, then we could no longer say that customs of other societies such as slavery are morally inferior to our own.

The Internet Encyclopedia of Philosophy

Moral Skepticism

Moral skepticism is an epistemological position that we do not have knowledge or justification for believing in objective moral principles. Moral skepticism does not involve the rejection of moral values themselves, but simply the denial that we have knowledge of an objective realm of morals. Moral skeptics sometimes argue that moral values are similar to aesthetic judgments. Aesthetic judgments such as "This painting is beautiful" and "The food in this restaurant is pretty awful" are not objective in nature are based on human preferences. Analogously, moral skeptics argue that moral judgments like "premarital sex is wrong" or "abortion is wrong" are also not objective in nature. The most effective argument for moral skepticism is to question the existence of the realms in which objective moral principles are thought to reside. If the very notion of a spirit-like realm of abstract entities is called into question, then moral principles cannot be objective in that sense.

MACKIE'S DEFENSE. In *Ethics: Inventing Right and Wrong*, J.L. Mackie defends moral skepticism with three specific arguments. His first argument is from cultural relativity. Mackie sees a problem with the fact that our allegedly objective moral beliefs do not appear to shape our cultural. Instead, it appears that it is our culture which shapes our particular moral beliefs, beliefs such as monogamy. Moral subjectivism, then, is the most reasonable explanation for why our moral beliefs mimic our culture. The only possible explanation an objectivist could have is that our particular moral beliefs become distorted as we try to perceive objective value through our diverse cultures. However, Mackie find this counter-argument weak. His second argument against moral realism is that there is some queer, or counterintuitive aspect of any description one might give of an objective moral realm. There are three distinct points to this argument. First, there is a metaphysical problem, or a problem based on the strange spirit-like realm which the realist would advocate. For Mackie, the strangeness of this realm alone is an argument against it. Second, there is a relational problem since it is not clear how this peculiar, non-natural realm would have any connection with natural objects and human actions. Using Plato's terminology, it is not clear how a spirit-like realm of the forms could affect the natural world of appearances: the two realms are too distinct. Third, there is an epistemological problem, that is, a problem in how we would have knowledge of these spirit-like things. We gain knowledge of the physical world through our five sense. But by what faculty do we gain knowledge of this spirit-like realm?

Mackie's third argument against moral realism is based on a psychological explanation for why people believe there are objective values (an explanation which he calls patterns of objectification). His point is that it is more reasonable (less paradoxical) to view morality as an artificial construction, providing we can give a decent account of why so many people erroneously believe that morality is objective. Mackie's psychological explanation is based on a tendency people have to objectify values which are actually subjective in origin. This tendency may best be described as a psychological projection which results from societal demands. There are two parts to this theory. The first is taken from Hume who argued that there is, in general, an instinctive psychological

tendency give an objective explanation to something which is subjective in origin. Second, society places external constraints on how we behave morally (such as society's demand that we should not run around naked). Given the external nature of these societal demands, we tend to think that the moral issue in question (running around naked in public) is externally objective. This, then, is why we erroneously believe that there are objective values.

Mackie concludes that even if values are not objective, this does not mean that morality is useless. Instead, Mackie emphasizes the importance of creating moral guidelines which regulate the actions of ourselves and others.

Morality and Religion

For thousands of years many philosophers and theologians have tied moral principles to the existence of God. There is some rationale for this approach. Moral principles seem to be absolute and eternal, and to gain this status they must rest on the nature of God, which is also absolute and eternal. Also, moral behavior is required of everyone, and one way of reinforcing the impotance of moral behavior is to note that God mandates moral principles. In a famous passage from his dialog *The Euthyphro*, Plato exposes a dilemma with linking morality with God. Known as "the Euthyphro dilemma" in the dialog Socrates asks a young man named Euthyphro the following question:

> The point which I should first wish to understand is whether the pious or holy is beloved by the gods because it is holy, or holy because it is beloved of the gods.

The two options in question are whether (1) God endorses a previously existing standard of morality that is external to him, or (2) God independently creates the standards of morality. The two options appear to be mutually exclusive, and, in the dialog, Socrates tries to explain this point to Euthyphro.

During the middle ages, religious philosophers who linked morality with God's existence indeed did choose between one of two options presented in the Euthyphro dilemma. Thomas Aquinas (1225-1274) offered a specific version of natural law theory by which God endorses a rational set of moral guidelines; Aquinas, then, goes with the first option of the Euthyphro dilemma. The theory of natural law involves three main contentions: (1) God prescribes a set of moral values and makes them law by instilling them in our human nature; (2) there is one ultimate rule of natural law, which we discover through an intuitive mental faculty; (3) from this ultimate rule, we deduce more specific moral rules that that carry the authority of natural law.

In the centuries following Aquinas, some natural law philosophers, such as Hugo Grotius, followed Aquinas's lead by going with the first option of the Euthyphro dilemma - that God endorses an independent and previously existing moral standard. However, other philosophers, such as William of Ockham and Samuel Pufendorf, went with the second option of the Euthyphro dilemma, namely that God independently creates the standards of morality. This position is called both divine command theory and voluntarism. On this view, God invents moral rules as a matter of his unconstrained and free will. By the 18th century, the concept of God's will played a key roll in many moral theories. Some writers, such as William King, argued that the existence of moral principles is completely dependent on God's will. Others, such as William Warburton, argued that God's will is an essential motivation for why we should adopt moral principles, although moral principles themselves are eternal and independent of God.

David Hume was the first philosopher since the middle ages to drive a wedge between religion and morality, separating the two completely, regardless of the stand that one takes on the Euthyphro dilemma. In two works, *Dialogues Concerning Natural Religion* (1779) and *The Natural History of Religion* (1757), Hume addresses the issue from several perspectives. First, he argues that our purely philosophical conceptions of God do not entitle us to ascribe to God the moral attributes that we see in

human nature. Human moral sentiments are linked to our biological nature and our survival. Since, God's nature - as traditionally understood -- infinitely surpasses that of human nature, then our human notions of morality cannot apply to him. Second, setting aside our philosophical conceptions of God, Hume argues that in our more popular conceptions of God we actually see God as an immoral being. He is cruel and spiteful. Finally, Hume argues that in our attempts to gain God's favor, we are not content to simply be moral, but we fall back on absurd religions rituals. That is, a religious person who aims at pleasing God will not have morality on his mind. Hume was so suspicious of the behavior of religious people that, as James Boswell reports, "when he heard a man was religious, he concluded he was a rascal."

In time, mainstream British moral philosophers adopted Hume's secualr approach to morality and eliminated references to God or religion in their theories. We see this especially in the theories offered by Bentham, Mill, Sidgwick, Moore, Ross, and Stevenson. In recent years, some philosophers of religion have revived divine command theory, most notably University of Notre Dame philosophy professor Philip L. Quinn. In reaction to this revived interest in divine command theory, Canadian philosopher Kai Nielsen argues in a series of publication that that the divine command theory is conceptually flawed and morality is in no way dependent upon religion.

Natural Law

The term ‘natural law’ is ambiguous. It refers to a type of moral theory, as well as to a type of legal theory, despite the fact that the core claims of the two kinds of theory are logically independent. According to natural law ethical theory, the moral standards that govern human behavior are, in some sense, objectively derived from the nature of human beings. According to natural law legal theory, the authority of at least some legal standards necessarily derives, at least in part, from considerations having to do with the moral merit of those standards. There are a number of different kinds of natural law theories of law, differing from each other with respect to the role that morality plays in determining the authority of legal norms.

Contents

I. **Two Kinds of Natural Law Theory**

At the outset, it is important to distinguish two kinds of theory that go by the name of natural law. The first is a theory of morality that is roughly characterized by the following theses. First, moral propositions have what is sometimes called objective standing in the sense that such propositions are the bearers of objective truth-value; that is, moral propositions can be objectively true or false. Though moral objectivism is sometimes equated with moral realism (see, e.g., Moore 1992, 190: “the truth of any moral proposition lies in its correspondence with a mind- and convention-independent moral reality”), the relationship between the two theories is controversial. Geoffrey Sayre-McCord (1988), for example, views moral objectivism as one species of moral realism, but not the only form; on Sayre-McCord’s view, moral subjectivism and moral intersubjectivism are also forms of moral realism. Strictly speaking, then, natural law moral theory is committed only to the objectivity of moral norms.

The second thesis constituting the core of natural law moral theory is the claim that standards of morality are in some sense derived from, or entailed by, the nature of the world and the nature of human beings. St. Thomas Aquinas, for example, identifies the rational nature of human beings as that which defines moral law: “the rule and measure of human acts is the reason, which is the first principle of human acts” (Aquinas, ST I-II, Q.90, A.I). On this common view, since human beings are by nature rational beings, it

is morally appropriate that they should behave in a way that conforms to their rational nature. Thus, Aquinas derives the moral law from the nature of human beings (thus, "natural law").

But there is another kind of natural law theory having to do with the relationship of morality to law. According to natural law theory of law, there is no clean division between the notion of law and the notion of morality. Though there are different versions of natural law theory, all subscribe to the thesis that there are at least some laws that depend for their "authority" not on some pre-existing human convention, but on the logical relationship in which they stand to moral standards. Otherwise put, some norms are authoritative in virtue of their moral content, even when there is no convention that makes moral merit a criterion of legal validity. The idea that the concepts of law and morality intersect in some way is called the Overlap Thesis.

As an empirical matter, many natural law moral theorists are also natural law legal theorists, but the two theories, strictly speaking, are logically independent. One can deny natural law theory of law but hold a natural law theory of morality. John Austin, the most influential of the early legal positivists, for example, denied the Overlap Thesis but held something that resembles a natural law ethical theory.

Indeed, Austin explicitly endorsed the view that it is not necessarily true that the legal validity of a norm depends on whether its content conforms to morality. But while Austin thus denied the Overlap Thesis, he accepted an objectivist moral theory; indeed, Austin inherited his utilitarianism almost wholesale from J.S. Mill and Jeremy Bentham. Here it is worth noting that utilitarians sometimes seem to suggest that they derive their utilitarianism from certain facts about human nature; as Bentham once wrote, "nature has placed mankind under the governance of two sovereign masters, pain and pleasure. It is for them alone to point out what we ought to do, as well as to determine what we shall do. On the one hand the standard of right and wrong, on the other the chain of causes and effects, are fastened to their throne" (Bentham 1948, 1). Thus, a commitment to natural law theory of morality is consistent with the denial of natural law theory of law.

Conversely, one could, though this would be unusual, accept a natural law theory of law without holding a natural law theory of morality. One could, for example, hold that the conceptual point of law is, in part, to reproduce the demands of morality, but also hold a form of ethical subjectivism (or relativism). On this peculiar view, the conceptual point of law would be to enforce those standards that are morally valid in virtue of cultural consensus. For this reason, natural law theory of law is logically independent of natural law theory of morality. The remainder of this essay will be exclusively concerned with natural law theories of law.

II. **Conceptual Naturalism.**

II.1 The Project of Conceptual Jurisprudence

The principal objective of conceptual (or analytic) jurisprudence has traditionally been to provide an account of what distinguishes law as a system of norms from other systems of norms, such as ethical norms. As John Austin describes the project, conceptual jurisprudence seeks "the essence or nature which is common to all laws that are properly so called" (Austin 1995, 11). Accordingly, the task of conceptual jurisprudence is to provide a set of necessary and sufficient conditions for the existence of law that distinguishes law from non-law in every possible world.

While this task is usually interpreted as an attempt to analyze the concepts of law and legal system, there is some confusion as to both the value and character of conceptual analysis in philosophy of law. As Brian Leiter (1998) points out, philosophy of law is one of the few philosophical disciplines that takes conceptual analysis as its principal concern; most other areas in philosophy have taken a naturalistic turn,

incorporating the tools and methods of the sciences. To clarify the role of conceptual analysis in law, Brian Bix (1995) distinguishes a number of different purposes that can be served by conceptual claims: (1) to track linguistic usage; (2) to stipulate meanings; (3) to explain what is important or essential about a class of objects; and (4) to establish an evaluative test for the concept-word. Bix takes conceptual analysis in law to be primarily concerned with (3) and (4).

In any event, conceptual analysis of law remains an important, if controversial, project in contemporary legal theory. Conceptual theories of law have traditionally been characterized in terms of their posture towards the Overlap Thesis. Thus, conceptual theories of law have traditionally been divided into two main categories: those like natural law legal theory that affirm there is a conceptual relation between law and morality and those like legal positivism that deny such a relation.

II.2 Classical Natural Law Theory

All forms of natural law theory subscribe to the Overlap Thesis, which asserts that there is some kind of non-conventional relation between law and morality. According to this view, then, the notion of law cannot be fully articulated without some reference to moral notions. Though the Overlap Thesis may seem unambiguous, there are a number of different ways in which it can be interpreted.

The strongest construction of the Overlap Thesis forms the foundation for the classical naturalism of Aquinas and Blackstone. Aquinas distinguishes four kinds of law: (1) eternal law; (2) natural law; (3) human law; and (4) divine law. Eternal law is comprised of those laws that govern the nature of an eternal universe; as Susan Dimock (1999, 22) puts it, one can "think of eternal law as comprising all those scientific (physical, chemical, biological, psychological, etc.) 'laws' by which the universe is ordered." Divine law is concerned with those standards that must be satisfied by a human being to achieve eternal salvation. One cannot discover divine law by natural reason alone; the precepts of divine law are disclosed only through divine revelation.

The natural law is comprised of those precepts of the eternal law that govern the behavior of beings possessing reason and free will. The first precept of the natural law, according to Aquinas, is the somewhat vacuous imperative to do good and avoid evil. Here it is worth noting that Aquinas holds a natural law theory of morality: what is good and evil, according to Aquinas, is derived from the rational nature of human beings. Good and evil are thus both objective and universal.

But Aquinas is also a natural law legal theorist. On his view, a human law (i.e., that which is promulgated by human beings) is valid only insofar as its content conforms to the content of the natural law; as Aquinas puts the point: "[E]very human law has just so much of the nature of law as is derived from the law of nature. But if in any point it deflects from the law of nature, it is no longer a law but a perversion of law" (ST I-II, Q.95, A.II). To paraphrase Augustine's famous remark, an unjust law is really no law at all.

The idea that a norm that does not conform to the natural law cannot be legally valid is the defining thesis of conceptual naturalism. As William Blackstone describes the thesis, "This law of nature, being co-eval with mankind and dictated by God himself, is of course superior in obligation to any other. It is binding over all the globe, in all countries, and at all times: no human laws are of any validity, if contrary to this; and such of them as are valid derive all their force, and all their authority, mediately or immediately, from this original" (1979, 41). In this passage, Blackstone articulates the two claims that constitute the theoretical core of conceptual naturalism: 1) there can be no legally valid standards that conflict with the natural law; and 2) all valid laws derive what force and authority they have from the natural law.

It should be noted that classical naturalism is consistent with allowing a substantial role to human beings

in the manufacture of law. While the classical naturalist seems committed to the claim that the law necessarily incorporates all moral principles, this claim does not imply that the law is exhausted by the set of moral principles. There will still be coordination problems (e.g., which side of the road to drive on) that can be resolved in any number of ways consistent with the set of moral principles. Thus, the classical naturalist does not deny that human beings have considerable discretion in creating natural law. Rather she claims only that such discretion is necessarily limited by moral norms: legal norms that are promulgated by human beings are valid only if they are consistent with morality.

Critics of conceptual naturalism have raised a number of objections to this view. First, it has often been pointed out that, *contra* Augustine, unjust laws are all-too- frequently enforced against persons. As Austin petulantly put the point:

> Now, to say that human laws which conflict with the Divine law are not binding, that is to say, are not laws, is to talk stark nonsense. The most pernicious laws, and therefore those which are most opposed to the will of God, have been and are continually enforced as laws by judicial tribunals. Suppose an act innocuous, or positively beneficial, be prohibited by the sovereign under the penalty of death; if I commit this act, I shall be tried and condemned, and if I object to the sentence, that it is contrary to the law of God, who has commanded that human lawgivers shall not prohibit acts which have no evil consequences, the Court of Justice will demonstrate the inconclusiveness of my reasoning by hanging me up, in pursuance of the law of which I have impugned the validity (Austin 1995, 158).

Of course, as Brian Bix (1999) points out, the argument does little work for Austin because it is always possible for a court to enforce a law against a person that does not satisfy Austin's own theory of legal validity.

Another frequently expressed worry is that conceptual naturalism undermines the possibility of moral criticism of the law; inasmuch as conformity with natural law is a necessary condition for legal validity, all valid law is, by definition, morally just. Thus, on this line of reasoning, the legal validity of a norm necessarily entails its moral justice. As Jules Coleman and Jeffrey Murphy (1990, 18) put the point:

> The important things [conceptual naturalism] supposedly allows us to do (e.g., morally evaluate the law and determine our moral obligations with respect to the law) are actually rendered more difficult by its collapse of the distinction between morality and law. If we really want to think about the law from the moral point of view, it may obscure the task if we see law and morality as essentially linked in some way. Moral criticism and reform of law may be aided by an initial moral skepticism about the law.

There are a couple of problems with this line of objection. First, conceptual naturalism does not foreclose criticism of those norms that are being enforced by a society as law. Insofar as it can plausibly be claimed that the content of a norm being enforced by society as law does not conform to the natural law, this is a legitimate ground of moral criticism: given that the norm being enforced by law is unjust, it follows, according to conceptual naturalism, that it is not legally valid. Thus, the state commits wrong by enforcing that norm against private citizens.

Second, and more importantly, this line of objection seeks to criticize a conceptual theory of law by pointing to its practical implications – a strategy that seems to commit a category mistake. Conceptual jurisprudence assumes the existence of a core of social practices (constituting law) that requires a conceptual explanation. The project motivating conceptual jurisprudence, then, is to articulate the concept of law in a way that accounts for these pre-existing social practices. A conceptual theory of law can legitimately be criticized for its failure to adequately account for the pre-existing data, as it were; but

it cannot legitimately be criticized for either its normative quality or its practical implications.

A more interesting line of argument has recently been taken up by Brian Bix (1996). Following John Finnis (1980), Bix rejects the interpretation of Aquinas and Blackstone as conceptual naturalists, arguing instead that the claim that an unjust law is not a law should not be taken literally:

> A more reasonable interpretation of statements like "an unjust law is no law at all" is that unjust laws are not laws "in the fullest sense." As we might say of some professional, who had the necessary degrees and credentials, but seemed nonetheless to lack the necessary ability or judgment: "she's no lawyer" or "he's no doctor." This only indicates that we do not think that the title in this case carries with it all the implications it usually does. Similarly, to say that an unjust law is "not really law" may only be to point out that it does not carry the same moral force or offer the same reasons for action as laws consistent with "higher law" (Bix 1996, 226).

Thus, Bix construes Aquinas and Blackstone as having views more similar to the neo- naturalism of John Finnis discussed below in Section III. Nevertheless, while a plausible case can be made in favor of Bix's view, the long history of construing Aquinas and Blackstone as conceptual naturalists, along with its pedagogical value in developing other theories of law, ensures that this practice is likely, for better or worse, to continue indefinitely.

III. **The Substantive Neo-Naturalism of John Finnis**

John Finnis takes himself to be explicating and developing the views of Aquinas and Blackstone. Like Bix, Finnis believes that the naturalism of Aquinas and Blackstone should not be construed as a conceptual account of the existence conditions for law. According to Finnis, the classical naturalists were not concerned with giving a conceptual account of legal validity; rather they were concerned with explaining the moral force of law: "the principles of natural law explain the obligatory force (in the fullest sense of 'obligation') of positive laws, even when those laws cannot be deduced from those principles" (Finnis 1980, 23-24). On Finnis's view of the Overlap Thesis, the essential function of law is to provide a justification for state coercion (a view he shares with Ronald Dworkin). Accordingly, an unjust law can be legally valid, but it cannot provide an adequate justification for use of the state coercive power and is hence not obligatory in the fullest sense; thus, an unjust law fails to realize the moral ideals implicit in the concept of law. An unjust law, on this view, is legally binding, but is not fully law.

Like classical naturalism, Finnis's naturalism is both an ethical theory and a theory of law. Finnis distinguishes a number of equally valuable basic goods: life, health, knowledge, play, friendship, religion, and aesthetic experience. Each of these goods, according to Finnis, has intrinsic value in the sense that it should, given human nature, be valued for its own sake and not merely for the sake of some other good it can assist in bringing about. Moreover, each of these goods is universal in the sense that it governs all human cultures at all times. The point of moral principles, on this view, is to give ethical structure to the pursuit of these basic goods; moral principles enable us to select among competing goods and to define what a human being can permissibly do in pursuit of a basic good.

On Finnis's view, the conceptual point of law is to facilitate the common good by providing authoritative rules that solve coordination problems that arise in connection with the common pursuit of these basic goods. Thus, Finnis sums up his theory of law as follows:

> [T]he term 'law' ... refer[s] primarily to rules made, in accordance with regulative legal rules, by a determinate and effective authority (itself identified and, standardly, constituted

> as an institution by legal rules) for a 'complete' community, and buttressed by sanctions in accordance with the rule-guided stipulations of adjudicative institutions, this ensemble of rules and institutions being directed to reasonably resolving any of the community's co-ordination problems (and to ratifying, tolerating, regulating, or overriding co-ordination solutions from any other institutions or sources of norms) for the common good of that community (Finnis 1980, 276).

Again, it bears emphasizing that Finnis takes care to deny that there is any necessary moral test for legal validity: "one would simply be misunderstanding my conception of the nature and purpose of explanatory definitions of theoretical concepts if one supposed that my definition 'ruled out as non-laws' laws which failed to meet, or meet fully, one or other of the elements of the definition" (Finnis 1980, 278).

Nevertheless, Finnis believes that to the extent that a norm fails to satisfy these conditions, it likewise fails to fully manifest the nature of law and thereby fails to fully obligate the citizen-subject of the law. Unjust laws may obligate in a technical legal sense, on Finnis's view, but they may fail to provide moral reasons for action of the sort that it is the point of legal authority to provide. Thus, Finnis argues that "a ruler's use of authority is radically defective if he exploits his opportunities by making stipulations intended by him not for the common good but for his own or his friends' or party's or faction's advantage, or out of malice against some person or group" (Finnis 1980, 352). For the ultimate basis of a ruler's moral authority, on this view, "is the fact that he has the opportunity, and thus the responsibility, of furthering the common good by stipulating solutions to a community's co- ordination problems" (Finnis 1980, 351).

Finnis's theory is certainly more plausible as a theory of law than the traditional interpretation of classical naturalism, but such plausibility comes, for better or worse, at the expense of naturalism's identity as a distinct theory of law. Indeed, it appears that Finnis's natural law theory is compatible with naturalism's historical adversary, legal positivism, inasmuch as Finnis's view is compatible with a source-based theory of legal validity; laws that are technically valid in virtue of source but unjust do not, according to Finnis, fully obligate the citizen. Indeed, Finnis (1996) believes that Aquinas's classical naturalism fully affirms the notion that human laws are "posited."

IV. **The Procedural Naturalism of Lon L. Fuller**

Like Finnis, Lon Fuller (1964) rejects the conceptual naturalist idea that there are necessary *substantive* moral constraints on the content of law. But Fuller, unlike Finnis, believes that law is necessarily subject to a *procedural* morality. On Fuller's view, human activity is necessarily goal-oriented or purposive in the sense that people engage in a particular activity because it helps them to achieve some end. Insofar as human activity is essentially purposive, according to Fuller, particular human activities can be understood only in terms that make reference to their purposes and ends. Thus, since lawmaking is essentially purposive activity, it can be understood only in terms that explicitly acknowledge its essential values and purposes:

> The only formula that might be called a definition of law offered in these writings is by now thoroughly familiar: law is the enterprise of subjecting human conduct to the governance of rules. Unlike most modern theories of law, this view treats law as an activity and regards a legal system as the product of a sustained purposive effort (Fuller 1964, 106).

To the extent that a definition of law can be given, then, it must include the idea that law's essential function is to "achiev[e] … [social] order … through subjecting people's conduct to the guidance of

general rules by which they may themselves orient their behavior" (Fuller 1965, 657).

Fuller's functionalist conception of law implies that nothing can count as law unless it is capable of performing law's essential function of guiding behavior. And to be capable of performing this function, a system of rules must satisfy the following principles: (P1) the rules must be expressed in general terms; (P2) the rules must be publicly promulgated; (P3) the rules must be prospective in effect; (P4) the rules must be expressed in understandable terms; (P5) the rules must be consistent with one another; (P6) the rules must not require conduct beyond the powers of the affected parties; (P7) the rules must not be changed so frequently that the subject cannot rely on them; and (P8) the rules must be administered in a manner consistent with their wording.

On Fuller's view, no system of rules that fails minimally to satisfy these principles of legality can achieve law's essential purpose of achieving social order through the use of rules that guide behavior. A system of rules that fails to satisfy (P2) or (P4), for example, cannot guide behavior because people will not be able to determine what the rules require. Accordingly, Fuller concludes that his eight principles are "internal" to law in the sense that they are built into the existence conditions for law.

These internal principles constitute a morality, according to Fuller, because law necessarily has positive moral value in two respects: (1) law conduces to a state of social order and (2) does so by respecting human autonomy because rules guide behavior. Since no system of rules can achieve these morally valuable objectives without minimally complying with the principles of legality, it follows, on Fuller's view, that they constitute a morality. Since these moral principles are built into the existence conditions for law, they are internal and hence represent a conceptual connection between law and morality. Thus, like the classical naturalists and unlike Finnis, Fuller subscribes to the strongest form of the Overlap Thesis, which makes him a conceptual naturalist.

Nevertheless, Fuller's conceptual naturalism is fundamentally different from that of classical naturalism. First, Fuller rejects the classical naturalist view that there are necessary moral constraints on the content of law, holding instead that there are necessary moral constraints on the procedural mechanisms by which law is made and administered: "What I have called the internal morality of law is ... a procedural version of natural law ... [in the sense that it is] concerned, not with the substantive aims of legal rules, but with the ways in which a system of rules for governing human conduct must be constructed and administered if it is to be efficacious and at the same time remain what it purports to be" (Fuller 1964, 96- 97).

Second, Fuller identifies the conceptual connection between law and morality at a higher level of abstraction than the classical naturalists. The classical naturalists view morality as providing substantive constraints on the content of individual laws; an unjust norm, on this view, is conceptually disqualified from being legally valid. In contrast, Fuller views morality as providing a constraint on the existence of a legal system: "A total failure in any one of these eight directions does not simply result in a bad system of law; it results in something that is not properly called a legal system at all" (Fuller 1964, 39).

Fuller's procedural naturalism is vulnerable to a number of objections. H.L.A. Hart, for example, denies Fuller's claim that the principles of legality constitute an internal morality; according to Hart, Fuller confuses the notions of morality and efficacy:

> [T]he author's insistence on classifying these principles of legality as a "morality" is a source of confusion both for him and his readers.... [T]he crucial objection to the designation of these principles of good legal craftsmanship as morality, in spite of the qualification "inner," is that it perpetrates a confusion between two notions that it is vital to hold apart: the notions of purposive activity and morality. Poisoning is no doubt a purposive

> activity, and reflections on its purpose may show that it has its internal principles. ("Avoid poisons however lethal if they cause the victim to vomit"....) But to call these principles of the poisoner's art "the morality of poisoning" would simply blur the distinction between the notion of efficiency for a purpose and those final judgments about activities and purposes with which morality in its various forms is concerned (Hart 1965, 1285-86).

On Hart's view, all actions, including virtuous acts like lawmaking and impermissible acts like poisoning, have their own internal standards of efficacy. But insofar as such standards of efficacy conflict with morality, as they do in the case of poisoning, it follows that they are distinct from moral standards. Thus, while Hart concedes that something like Fuller's eight principles are built into the existence conditions for law, he concludes they do not constitute a conceptual connection between law and morality.

Unfortunately, Hart overlooks the fact that most of Fuller's eight principles double as moral ideals of fairness. For example, public promulgation in understandable terms may be a necessary condition for efficacy, but it is also a moral ideal; it is morally objectionable for a state to enforce rules that have not been publicly promulgated in terms reasonably calculated to give notice of what is required. Similarly, we take it for granted that it is wrong for a state to enact retroactive rules, inconsistent rules, and rules that require what is impossible. Poisoning may have its internal standards of efficacy, but such standards are distinguishable from the principles of legality in that they conflict with moral ideals.

Nevertheless, Fuller's principles operate internally, not as moral ideals, but merely as principles of efficacy. As Fuller would likely acknowledge, the existence of a legal system is consistent with considerable divergence from the principles of legality. Legal standards, for example, are necessarily promulgated in general terms that inevitably give rise to problems of vagueness. And officials all too often fail to administer the laws in a fair and even-handed manner—even in the best of legal systems. These divergences may always be *prima facie* objectionable, but they are inconsistent with a legal system only when they render a legal system incapable of performing its essential function of guiding behavior. Insofar as these principles are built into the existence conditions for law, it is because they operate as efficacy conditions—and not because they function as moral ideals.

V. **Ronald Dworkin's "Third Theory"**

Ronald Dworkin's so-called third theory of law is best understood as a response to legal positivism, which is essentially constituted by three theoretical commitments: the Social Fact Thesis, the Conventionality Thesis, and the Separability Thesis. The Social Fact Thesis asserts it is a necessary truth that legal validity is ultimately a function of certain kinds of social facts; the idea here is that what ultimately explains the validity of a law is the presence of certain social facts, especially formal promulgation by a legislature.

The Conventionality Thesis emphasizes law's conventional nature, claiming that the social facts giving rise to legal validity are authoritative in virtue of a social convention. On this view, the criteria that determine whether or not any given norm counts as a legal norm are binding because of an implicit or explicit agreement among officials. Thus, for example, the U.S. Constitution is authoritative in virtue of the conventional fact that it was formally ratified by all fifty states.

The Separability Thesis, at the most general level, simply denies naturalism's Overlap Thesis; according to the Separability Thesis, there is no conceptual overlap between the notions of law and morality. As Hart more narrowly construes it, the Separability Thesis is "just the simple contention that it is in no sense a necessary truth that laws reproduce or satisfy certain demands of morality, though in fact they

have often done so" (Hart 1994, 185-186).

Dworkin rejects positivism's Social Fact Thesis on the ground that there are some legal standards the authority of which cannot be explained in terms of social facts. In deciding hard cases, for example, judges often invoke moral principles that Dworkin believes do not derive their *legal* authority from the social criteria of legality contained in a rule of recognition (Dworkin 1977, p. 40).

In *Riggs v. Palmer*, for example, the court considered the question of whether a murderer could take under the will of his victim. At the time the case was decided, neither the statutes nor the case law governing wills expressly prohibited a murderer from taking under his victim's will. Despite this, the court declined to award the defendant his gift under the will on the ground that it would be wrong to allow him to profit from such a grievous wrong. On Dworkin's view, the court decided the case by citing "the principle that no man may profit from his own wrong as a background standard against which to read the statute of wills and in this way justified a new interpretation of that statute" (Dworkin 1977, 29).

On Dworkin's view, the *Riggs* court was not just reaching beyond the law to extralegal standards when it considered this principle. For the *Riggs* judges would "rightfully" have been criticized had they failed to consider this principle; if it were merely an extralegal standard, there would be no rightful grounds to criticize a failure to consider it (Dworkin 1977, 35). Accordingly, Dworkin concludes that the best explanation for the propriety of such criticism is that principles are part of the law.

Further, Dworkin maintains that the legal authority of standards like the *Riggs* principle cannot derive from promulgation in accordance with purely formal requirements: "[e]ven though principles draw support from the official acts of legal institutions, they do not have a simple or direct enough connection with these acts to frame that connection in terms of criteria specified by some ultimate master rule of recognition" (Dworkin 1977, 41).

On Dworkin's view, the legal authority of the *Riggs* principle can be explained wholly in terms of its content. The *Riggs* principle was binding, in part, because it is a requirement of fundamental fairness that figures into the best moral justification for a society's legal practices considered as a whole. A moral principle is legally authoritative, according to Dworkin, insofar as it maximally conduces to the best moral justification for a society's legal practices considered as a whole.

Dworkin believes that a legal principle maximally contributes to such a justification if and only if it satisfies two conditions: (1) the principle coheres with existing legal materials; and (2) the principle is the most morally attractive standard that satisfies (1). The correct legal principle is the one that makes the law the moral best it can be. Accordingly, on Dworkin's view, adjudication is and should be interpretive:

> [J]udges should decide hard cases by interpreting the political structure of their community in the following, perhaps special way: by trying to find the best justification they can find, in principles of political morality, for the structure as a whole, from the most profound constitutional rules and arrangements to the details of, for example, the private law of tort or contract (Dworkin 1982, 165).

There are, thus, two elements of a successful interpretation. First, since an interpretation is successful insofar as it justifies the particular practices of a particular society, the interpretation must *fit* with those practices in the sense that it coheres with existing legal materials defining the practices. Second, since an interpretation provides a *moral justification* for those practices, it must present them in the best possible moral light.

For this reason, Dworkin argues that a judge should strive to interpret a case in roughly the following way:

> A thoughtful judge might establish for himself, for example, a rough “threshold” of fit which any interpretation of data must meet in order to be “acceptable” on the dimension of fit, and then suppose that if more than one interpretation of some part of the law meets this threshold, the choice among these should be made, not through further and more precise comparisons between the two along that dimension, but by choosing the interpretation which is “substantively” better, that is, which better promotes the political ideals he thinks correct (Dworkin 1982, 171).

As Dworkin conceives it, then, the judge must approach judicial decision-making as something that resembles an exercise in moral philosophy. Thus, for example, the judge must decide cases on the basis of those moral principles that “figure[] in the soundest theory of law that can be provided as a justification for the explicit substantive and institutional rules of the jurisdiction in question” (Dworkin 1977, 66).

And this is a process, according to Dworkin, that “must carry the lawyer very deep into political and moral theory.” Indeed, in later writings, Dworkin goes so far as to claim, somewhat implausibly, that “any judge’s opinion is itself a piece of legal philosophy, even when the philosophy is hidden and the visible argument is dominated by citation and lists of facts” (Dworkin 1986, 90).

Dworkin believes his theory of judicial obligation is a consequence of what he calls the Rights Thesis, according to which judicial decisions always enforce pre-existing rights: “even when no settled rule disposes of the case, one party may nevertheless have a right to win. It remains the judge’s duty, even in hard cases, to discover what the rights of the parties are, not to invent new rights retrospectively” (Dworkin 1977, 81).

In “Hard Cases,” Dworkin distinguishes between two kinds of legal argument. Arguments of policy “justify a political decision by showing that the decision advances or protects some collective goal of the community as a whole” (Dworkin 1977, 82). In contrast, arguments of principle “justify a political decision by showing that the decision respects or secures some individual or group right” (Dworkin 1977, 82).

On Dworkin’s view, while the legislature may legitimately enact laws that are justified by arguments of policy, courts may not pursue such arguments in deciding cases. For a consequentialist argument of policy can never provide an adequate justification for deciding in favor of one party’s claim of right and against another party’s claim of right. An appeal to a pre-existing right, according to Dworkin, can ultimately be justified only by an argument of principle. Thus, insofar as judicial decisions necessarily adjudicate claims of right, they must ultimately be based on the moral principles that figure into the best justification of the legal practices considered as a whole.

Notice that Dworkin’s views on legal principles and judicial obligation are inconsistent with all three of legal positivism’s core commitments. Each contradicts the Conventionality Thesis insofar as judges are bound to interpret posited law in light of unposited moral principles. Each contradicts the Social Fact Thesis because these moral principles count as part of a community’s law regardless of whether they have been formally promulgated. Most importantly, Dworkin’s view contradicts the Separability Thesis in that it seems to imply that some norms are necessarily valid in virtue of their moral content. It is his denial of the Separability Thesis that places Dworkin in the naturalist camp.

Natural Theology

"Natural Theology" is the favorite term in the eighteenth and nineteenth centuries designating the knowledge of God drawn from nature in distinction from the knowledge of God contained in revelation. This division of theology into natural and revealed had its roots in the scholastic distinction between the two truths, one derived from nature by the use of the Aristotelian logic, subject to the authority of the Church, the other, truth above reason, revealed by God but formulated and taught solely by authority of the Church. The deists relied exclusively on natural theology, on the ground that the being and attributes of God could be exhaustively ascertained from the constitution and course of the world, thus superseding the necessity of supernatural revelation. David Hume, by his theory of knowledge, proved that even this knowledge was too precarious for rational certitude. On the other hand, Bishop Butler (*Analogy of Religion*, London, 1736) maintained that natural and revealed religion were so far one that the truths of natural theology provided a basis for the characteristic truths of the Christian faith, such as miracles, the incarnation, and redemption. Later, the wisdom, power, and even the goodness of God were held to be demonstrable by the processes of natural theology (Samuel Clarke, *A Demonstration of the Being and Attributes of God*, London, 1-105; William Paley, *Natural Theology*, ib. 1802). The function and name of *natural theology* continued in vogue until the latter portion of the 19th century. This habit of thought has, however, been strongly opposed by Ritschl and his school. Relying on Kant's distinction between the pure and the practical reason, they seek the source of the knowledge of God not through the theoretic judgments of science or philosophy, but only through value-judgments to which revelation is addressed. Nature being impersonal can neither receive nor communicate the personal redemptive disclosure of God which man needs for reconciliation with him; this is to be sought ultimately only in Christ and the Christian community.

Naturalistic Fallacy

The naturalistic fallacy is a metaethical theory proposed by G.E. Moore (1873-1958) in *Principia Ethica* (1903) that the notion of moral goodness cannot be defined or identified with any property. Moore argues that "goodness" is a foundational and unanalyzable property, similar to the foundational notion of "yellowness," and is not capable of being explained in terms of anything more basic. We intuitively recognize goodness when we see it, as we similarly recognize yellowness when we see it. But the notion of "goodness" itself cannot be defined. For Moore, philosophers who attempt to define intrinsic goodness commit the *naturalistic fallacy*, the fallacy of defining the term "goodness" in terms of some natural property, such as pleasure. Moore defends his contention with what has been called the *open question argument*. For any property we attempt to identify with "goodness," we can ask, "Is that property itself good?" For example, if I claim that pleasure is the highest intrinsic good, the question can be asked, "But, is pleasure itself good?" The fact that this question makes sense shows that "pleasure" and "goodness" are not identical. Moore believes that no proposed natural property can pass the test of the open question argument. This implies that all moral theories fail that are based on anything other than immediate moral intuition. It is only of secondary importance whether an action produces pleasure, is in accord with the will of God, or is conducive to reason. What truly matters is whether we can simply recognize the goodness of a particular action.

Commentators argue that we may more accurately view the naturalistic fallacy as a definist fallacy: it is wrong to identify moral goodness with *any* property at all. Subsets of the definist fallacy are (1) the naturalistic fallacy, which is the attempt to identify goodness with a natural property such as pleasure, and (2) the metaphysical fallacy, which is the attempt to identify goodness with a metaphysical property, such as the will of God.

One problem with Moore's theory can be raised from a positivist or practical point of view. Assume for the moment that his open question argument is successful, and goodness cannot be strictly defined in terms of any natural property. There is still another way in which a natural property such as human happiness can be considered the highest intrinsic good. If in the past we have observed that all moral action promotes human happiness, then for all *practical* purposes, we have discovered the highest intrinsic good. We could argue that it is irrelevant at that point whether we can intuitively recognize the presence of goodness. The presence of human happiness is the only criterion of moral value we need for the purposes of making our judgment.

A second problem with Moore's view concerns how it is that we perceive goodness, given that it is indefinable and foundational. Although "yellowness" is an indefinable and foundational concept, we perceive yellowness through our sense of sight. Is there a special *moral sense* we have which allows us to perceive moral goodness? Moore resists postulating the existence of a moral sixth sense -- an approach which was popular in the 18th century. Instead, he argues that we *intuitively* recognize good. Perception of moral goodness, then, seems to depend on a special rational faculty for Moore. But, from a

psychological standpoint, this is as empirically problematic as moral sense theory.

Neoplatonism

CHARACTER AND ORIGIN. Neoplatonism is the last development of Greek philosophy. It adopted elements of the older systems, especially the Platonic, and added an element of mystical speculation. This speculation focused mainly on the relation of God to humans and the universe; however, physics, ethics, and logic were not completely neglected. The mystical tendency, which is apparent in Plato, is responsible for redirecting Neoplatonic speculation away from the scientific strictness of older Greek philosophers. In the historical development the Neoplatonists follow immediately upon the Neopythagoreans and the Pythagoreanizing or eclectic Platonists, but the Neoplatonist school had much more original and independent ideas than the schools which preceded it. As a definite school, it originated in Alexandria, where the mixture of nationalities made for a fusion of earlier philosophic and religious tendencies. Its founder was Ammonius Saccas, who had been brought up a Christian and had then returned to Hellenism. He left no written remains, and it is thus difficult to determine his exact relation to his successors. Among his pupils were Plotinus, the two Origens (the Neoplatonist and the Christian),and Longinus the critic. When Neoplatonism is mentioned in a general way, it connotes mainly the teaching of Plotinus. See PLOTINUS

PORPHYRY. Porphyry, the head of the Syrian school, was the most important among the disciples of Plotinus. Porphyry was born at Batanea, Syria in 233 CE, and he died in Rome in 304 CE. He wrote lives of Plotinus and Pythagoras, *treatises De abstinentia* and *De antro nymphartim*, a letter to Marcella, another *De diis doemonibus ad Anebonem*, a brief compendium of the doctrines of Plotinus entitled *Aphormai pros ta noeta*. he also authored an introduction to the "Categories" of Aristotle, besides a number of other works no longer in existence. The work last named, *Aphormai pros ta noeta*, is of considerable importance in the history of philosophy, as it contains the germ of the whole controversy between realism and nominalism. The religious character of Porphyry's philosophy is shown by his placing its aim in the "saving of the soul." He mentions four kinds of virtues: the political, which make an ordinary good man; the purifying, which make him a "daemonic" man; those which look up to the *nous*, their cause, constituting the rational activity of the soul; and the virtue of the *nous* itself, the paradigmatic. Connected with the purification on which he insists so strongly is the strict asceticism which he recommends, including abstinence from meat and from sexual intercourse. He asserts that he has reached once, but only once, and that when he was sixty-eight, the height of his desire, being permitted to approach and to be united with the most high God. While he regarded the national religions as justifiable, making no distinction between those of the Greeks and those of the barbarians, he opposed strongly the complete novelty of Christianity in his fifteen books "Against the Christians," which were totally destroyed by Theodosius II. in 335. This work is an indication that the Neoplatonists felt the whole Hellenic system and their own position to be threatened by Christianity. It was considered of so much importance that replies were published by Methodius and Eusebius of Caesarea among others.

JAMBLICHUS AND OTHERS. The sober character of Neoplatonism was lost in the soaring speculations of Jamblichus. Jamblichus was born in Coele, Syria in 283 CE, and he died at Alexandria in 330 CE. His belief in magic, miracles, and theurgy (the art of compelling demons and other supernatural powers to produce desired results), goes beyond all measure. His miracle-seeking followers believed him a being of a superior order, and called him "the Divine" or "Divinest." Besides his principal work, the *Synagoge ton Pythagoreion dogmaton*, five others are extant, of which the most important are the *Vita Pythagorica* and the *Adhortatiq ad philosophiam*. The *treatise De mysteries*, said to have been ascribed to him by Proclus, is certainly not his, but probably belongs to some member of his school. Jainblichus attempted to justify the whole polytheistic system, and added a still more absolutely primal and exalted One above the One of Plotinus. The lower powers are divided into a long series of hierarchies, described with a Pythagorean fondness for exact numbers. With the whole theurgic system is connected the belief that images of the gods, whether fallen from heaven or made by men, partake of divinity and are capable of working miracles. The surest method for winning the divine protection is by prayer, which the gods can bear apart from any tangible medium. The return to the suprasensual world is made by means of the virtues, of which at first Jamblichus adopted the fourfold classification of Porphyry, afterward adding a fifth class, the priestly or simple virtues (simple as referring directly to the One), by which the soul rises to mystic union with the Supreme. Among the disciples of Jamblichus the most independent thinker was Theodorus of Asine. Others of the Syrian school were Dexippus, Edesius of Cappadocia, who long conducted a flourishing school at Pergamum, Chrysanthius of Sardis, and Ennapius, known by his biographies of philosophers and sophists. A singular combination of learning and attractiveness won wide renown for Hypatia. Her disciple and admirer Synesius showed a great deal of Neoplatonist influence in his writings.

THE ATHENIAN SCHOOL. The Athenian school was later in time than the Syrian, and devoted itself to more scientific efforts, especially the exposition of Plato and Aristotle. Its first leader was Plutarch of Athens, head of the school there until 433. He seems to have followed Plotinus very closely. His successor was Syrianus (until about 450),who was then succeeded by Proclusthe Lycian. He remained the head of the school until his death in 485. Proclusthe Lycian's principal works are his commentaries on Plato (especially on the *Timoxus* and the *Republic*), the *Stoicheiosis theologike*, and the *Peri tes kata Platona theologias*. He attempted, like the later scholastics, to reduce the entire philosophical tradition to a complete logical system. He regarded the Platonic writings in the light of a revelation, but paid much attention also to Homer and Hesiod, and had an unbounded reverence for Jamblichus, on whom, with Plotinus, he depends for a large part of his system. Of less importance are his successors at Athens, Marinus, Zenodotus, Isidore of Alexandria, Hegias, and Damascius. In 529 the teaching of philosophy at Athens was suppressed by Justinian and the property of the school confiscated. Two years later, Damascius, with Simplicius, the well-known commentator on Aristotle, and five other Neoplatonists, went to Persia in the hope of finding in King Chosroes a friend of philosophy, but were grievously disappointed and returned to Athens in 533. From this time on the efforts of those who were interested in such matters tended more and more to limit themselves to the exposition of earlier philosophers, especially Plato and Aristotle. The final dissolution of Neoplatonism was due partly to its unbounded recklessness of speculation and partly to the moral and religious force of Christianity, which borrowed what was most valuable of the Neoplatonist system and breathed new life into it. Augustine, Dionysius the Areopagite, and Scotus Erigena were particularly influenced by it, and through the two latter both the mystical and the pantheistic movements of the Middle Ages received much of their direction.

Neoplatonism had a marked revival at the Renaissance, especially through Marsilius Ficinus and Pico della Mirandola; and through Giordano Bruno in particular it has come down to modern times in one form or another, being discoverable by an acute analysis in the theories of schelling, Fichte, Hegel, and other leading nineteenth-century philosophers.

Nihilism

Nihilism is the belief that all values are baseless and that nothing can be known or communicated. It is often associated with extreme pessimism and a radical skepticism that condemns existence. A true nihilist would believe in nothing, have no loyalties, and no purpose other than, perhaps, an impulse to destroy. While few philosophers would claim to be nihilists, nihilism is most often associated with Friedrich Nietzsche who argued that its corrosive effects would eventually destroy all moral, religious, and metaphysical convictions and precipitate the greatest crisis in human history. In the 20th century, nihilistic themes--epistemological failure, value destruction, and cosmic purposelessness--have preoccupied artists, social critics, and philosophers. Mid-century, for example, the existentialists helped popularize tenets of nihilism in their attempts to blunt its destructive potential. By the end of the century, existential despair as a response to nihilism gave way to an attitude of indifference, often associated with antifoundationalism.

Section Headings:

Origins

"Nihilism" comes from the Latin *nihil*, or nothing, which means not anything, that which does not exist. It appears in the verb "annihilate," meaning to bring to nothing, to destroy completely. Early in the nineteenth century, Friedrich Jacobi used the word to negatively characterize transcendental idealism. It only became popularized, however, after its appearance in Ivan Turgenev's novel *Fathers and Sons* (1862) where he used "nihilism" to describe the crude scientism espoused by his character Bazarov who preaches a creed of total negation.

In Russia, nihilism became identified with a loosely organized revolutionary movement (C.1860-1917) that rejected the authority of the state, church, and family. In his early writing, anarchist leader Mikhael Bakunin (1814-1876) composed the notorious entreaty still identified with nihilism: "Let us put our trust in the eternal spirit which destroys and annihilates only because it is the unsearchable and eternally creative source of all life--the passion for destruction is also a creative passion!" (*Reaction in Germany*, 1842). The movement advocated a social arrangement based on rationalism and materialism as the sole source of knowledge and individual freedom as the highest goal. By rejecting man's spiritual essence in

favor of a solely materialistic one, nihilists denounced God and religious authority as antithetical to freedom. The movement eventually deteriorated into an ethos of subversion, destruction, and anarchy, and by the late 1870s, a nihilist was anyone associated with clandestine political groups advocating terrorism and assassination.

The earliest philosophical positions associated with what could be characterized as a nihilistic outlook are those of the Skeptics. Because they denied the possibility of certainty, Skeptics could denounce traditional truths as unjustifiable opinions. When Demosthenes (c.371-322 BC), for example, observes that "What he wished to believe, that is what each man believes" (*Olynthiac*), he posits the relational nature of knowledge. Extreme skepticism, then, is linked to *epistemological nihilism* which denies the possibility of knowledge and truth; this form of nihilism is currently identified with postmodern antifoundationalism. Nihilism, in fact, can be understood in several different ways. *Political Nihilism*, as noted, is associated with the belief that the destruction of all existing political, social, and religious order is a prerequisite for any future improvement. *Ethical nihilism* or moral nihilism rejects the possibility of absolute moral or ethical values. Instead, good and evil are nebulous, and values addressing such are the product of nothing more than social and emotive pressures. *Existential nihilism* is the notion that life has no intrinsic meaning or value, and it is, no doubt, the most commonly used and understood sense of the word today.

Max Stirner's (1806-1856) attacks on systematic philosophy, his denial of absolutes, and his rejection of abstract concepts of any kind often places him among the first philosophical nihilists. For Stirner, achieving individual freedom is the only law; and the state, which necessarily imperils freedom, must be destroyed. Even beyond the oppression of the state, though, are the constraints imposed by others because their very existence is an obstacle compromising individual freedom. Thus Stirner argues that existence is an endless "war of each against all" (*The Ego and its Own*, trans. 1907).

Friedrich Nietzsche and Nihilism

Among philosophers, Friedrich Nietzsche is most often associated with nihilism. For Nietzsche, there is no objective order or structure in the world except what we give it. Penetrating the façades buttressing convictions, the nihilist discovers that all values are baseless and that reason is impotent. "*Every* belief, every considering something-true," Nietzsche writes, "is necessarily false because there is simply no *true world*" (*Will to Power* [notes from 1883-1888]). For him, nihilism requires a radical repudiation of all imposed values and meaning: "Nihilism is . . . not only the belief that everything deserves to perish; but one actually puts one's shoulder to the plough; *one destroys"* (*Will to Power*).

The caustic strength of nihilism is absolute, Nietzsche argues, and under its withering scrutiny "*the highest values devalue themselves*. The aim is lacking, and 'Why' finds no answer" (*Will to Power*). Inevitably, nihilism will expose all cherished beliefs and sacrosanct truths as symptoms of a defective Western mythos. This collapse of meaning, relevance, and purpose will be the most destructive force in history, constituting a total assault on reality and nothing less than the greatest crisis of humanity:

> What I relate is the history of the next two centuries. I describe what is coming, what can no longer come differently: *the advent of nihilism*. . . . For some time now our whole European culture has been moving as toward a catastrophe, with a tortured tension that is growing from decade to decade: restlessly, violently, headlong, like a river that wants to reach the end. . . . (*Will to Power*)

Since Nietzsche's compelling critique, nihilistic themes--epistemological failure, value destruction, and cosmic purposelessness--have preoccupied artists, social critics, and philosophers. Convinced that Nietzsche's analysis was accurate, for example, Oswald Spengler in *The Decline of the West* (1926) studied several cultures to confirm that patterns of nihilism were indeed a conspicuous feature of collapsing civilizations. In each of the failed cultures he examines, Spengler noticed that centuries-old religious, artistic, and political traditions were weakened and finally toppled by the insidious workings of several distinct nihilistic postures: the Faustian nihilist "shatters the ideals"; the Apollinian nihilist "watches them crumble before his eyes"; and the Indian nihilist "withdraws from their presence into himself." Withdrawal, for instance, often identified with the negation of reality and resignation advocated by Eastern religions, is in the West associated with various versions of epicureanism and stoicism. In his study, Spengler concludes that Western civilization is already in the advanced stages of decay with all three forms of nihilism working to undermine epistemological authority and ontological grounding.

In 1927, Martin Heidegger, to cite another example, observed that nihilism in various and hidden forms was already "the normal state of man" (*The Question of Being*). Other philosophers' predictions about nihilism's impact have been dire. Outlining the symptoms of nihilism in the 20th century, Helmut Thielicke wrote that "Nihilism literally has only one truth to declare, namely, that ultimately Nothingness prevails and the world is meaningless" (*Nihilism: Its Origin and Nature, with a Christian Answer*, 1969). From the nihilist's perspective, one can conclude that life is completely amoral, a conclusion, Thielicke believes, that motivates such monstrosities as the Nazi reign of terror. Gloomy predictions of nihilism's impact are also charted in Eugene Rose's *Nihilism: The Root of the Revolution of the Modern Age* (1994). If nihilism proves victorious--and it's well on its way, he argues--our world will become "a cold, inhuman world" where "nothingness, incoherence, and absurdity" will triumph.

Existential Nihilism

While nihilism is often discussed in terms of extreme skepticism and relativism, for most of the 20th century it has been associated with the belief that life is meaningless. Existential nihilism begins with the notion that the world is without meaning or purpose. Given this circumstance, existence itself--all action, suffering, and feeling--is ultimately senseless and empty.

In *The Dark Side: Thoughts on the Futility of Life* (1994), Alan Pratt demonstrates that existential nihilism, in one form or another, has been a part of the Western intellectual tradition from the beginning. The Skeptic Empedocles' observation that "the life of mortals is so mean a thing as to be virtually un-life," for instance, embodies the same kind of extreme pessimism associated with existential nihilism. In antiquity, such profound pessimism may have reached its apex with Hegesis. Because miseries vastly outnumber pleasures, happiness is impossible, the philosopher argues, and subsequently advocates suicide. Centuries later during the Renaissance, William Shakespeare eloquently summarized the existential nihilist's perspective when, in this famous passage near the end of *Macbeth*, he has Macbeth pour out his disgust for life:

> Out, out, brief candle!
> Life's but a walking shadow, a poor player
> That struts and frets his hour upon the stage
> And then is heard no more; it is a tale
> Told by an idiot, full of sound and fury,

Signifying nothing.

In the twentieth century, it's the atheistic existentialist movement, popularized in France in the 1940s and 50s, that is responsible for the currency of existential nihilism in the popular consciousness. Jean-Paul Sartre's (1905-1980) defining preposition for the movement, "existence precedes essence," rules out any ground or foundation for establishing an essential self or a human nature. When we abandon illusions, life is revealed as nothing; and for the existentialists, nothingness is the source of not only absolute freedom but also existential horror and emotional anguish. Nothingness reveals each individual as an isolated being "thrown" into an alien and unresponsive universe, barred forever from knowing why yet required to invent meaning. It's a situation that's nothing short of *absurd*. Writing from the enlightened perspective of the absurd, Albert Camus (1913-1960) observed that Sisyphus' plight, condemned to eternal, useless struggle, was a superb metaphor for human existence (*The Myth of Sisyphus*, 1942).

The common thread in the literature of the existentialists is coping with the emotional anguish arising from our confrontation with nothingness, and they expended great energy responding to the question of whether surviving it was possible. Their answer was a qualified "Yes," advocating a formula of passionate commitment and impassive stoicism. In retrospect, it was an anecdote tinged with desperation because in an absurd world there are absolutely no guidelines, and any course of action is problematic. Passionate commitment, be it to conquest, creation, or whatever, is itself meaningless. Enter nihilism.

Camus, like the other existentialists, was convinced that nihilism was the most vexing problem of the twentieth century. Although he argues passionately that individuals could endure its corrosive effects, his most famous works betray the extraordinary difficulty he faced building a convincing case. In *The Stranger* (1942), for example, Meursault has rejected the existential suppositions on which the uninitiated and weak rely. Just moments before his execution for a gratuitous murder, he discovers that life alone is reason enough for living, a *raison d'être*, however, that in context seems scarcely convincing. In *Caligula* (1944), the mad emperor tries to escape the human predicament by dehumanizing himself with acts of senseless violence, fails, and surreptitiously arranges his own assassination. *The Plague* (1947) shows the futility of doing one's best in an absurd world. And in his last novel, the short and sardonic, *The Fall* (1956), Camus posits that *everyone* has bloody hands because we are all responsible for making a sorry state worse by our inane action and inaction alike. In these works and other works by the existentialists, one is often left with the impression that living authentically with the meaninglessness of life is impossible.

Camus was fully aware of the pitfalls of defining existence without meaning, and in his philosophical essay *The Rebel* (1951) he faces the problem of nihilism head-on. In it, he describes at length how metaphysical collapse often ends in total negation and the victory of nihilism, characterized by profound hatred, pathological destruction, and incalculable violence and death.

Antifoundationalism and Nihilism

By the late 20th century, "nihilism" had assumed two different castes. In one form, "nihilist" is used to characterize the postmodern man, a dehumanized conformist, alienated, indifferent, and baffled, directing psychological energy into hedonistic narcissism or into a deep *ressentiment* that often explodes in violence. This perspective is derived from the existentialists' reflections on nihilism stripped of any hopeful expectations, leaving only the experience of sickness, decay, and disintegration.

In his study of meaninglessness, Donald Crosby writes that the source of modern nihilism paradoxically

stems from a commitment to honest intellectual openness. "Once set in motion, the process of questioning could come to but one end, the erosion of conviction and certitude and collapse into despair" (*The Specter of the Absurd,* 1988). When sincere inquiry is extended to moral convictions and social consensus, it can prove deadly, Crosby continues, promoting forces that ultimately destroy civilizations. Michael Novak's recently revised *The Experience of Nothingness* (1968, 1998) tells a similar story. Both studies are responses to the existentialists' gloomy findings from earlier in the century. And both optimistically discuss ways out of the abyss by focusing of the positive implications nothingness reveals, such as liberty, freedom, and creative possibilities. Novak, for example, describes how since WWII we have been working to "climb out of nihilism" on the way to building a new civilization.

In contrast to the efforts to overcome nihilism noted above is the uniquely postmodern response associated with the current antifoundationalists. The philosophical, ethical, and intellectual crisis of nihilism that has tormented modern philosophers for over a century has given way to mild annoyance or, more interestingly, an upbeat acceptance of meaninglessness.

French philosopher Jean-Francois Lyotard characterizes postmodernism as an "incredulity toward metanarratives," those all-embracing foundations that we have relied on to make sense of the world. This extreme skepticism has undermined intellectual and moral hierarchies and made "truth" claims, transcendental or transcultural, problematic. Postmodern antifoundationalists, paradoxically grounded in relativism, dismiss knowledge as relational and "truth" as transitory, genuine only until something more palatable replaces it (reminiscent of William James' notion of "cash value"). The critic Jacques Derrida, for example, asserts that one can never be sure that what one *knows* corresponds with what *is.* Since human beings participate in only an infinitesimal part of the whole, they are unable to grasp anything with certainty, and absolutes are merely "fictional forms."

American antifoundationalist Richard Rorty makes a similar point: "Nothing grounds our practices, nothing legitimizes them, nothing shows them to be in touch with the way things are" ("From Logic to Language to Play," 1986). This epistemological cul-de-sac, Rorty concludes, leads inevitably to nihilism. "Faced with the nonhuman, the nonlinguistic, we no longer have the ability to overcome contingency and pain by appropriation and transformation, but only the ability to *recognize* contingency and pain" (*Contingency, Irony, and Solidarity*, 1989*).* In contrast to Nietzsche's fears and the angst of the existentialists, nihilism becomes for the antifoundationalists just another aspect of our contemporary milieu, one best endured with sang-froid.

In *The Banalization of Nihilism* (1992) Karen Carr discusses the antifoundationalist response to nihilism. Although it still inflames a paralyzing relativism and subverts critical tools, "cheerful nihilism" carries the day, she notes, distinguished by an easy-going acceptance of meaninglessness. Such a development, Carr concludes, is alarming. If we accept that all perspectives are equally non-binding, then intellectual or moral arrogance will determine which perspective has precedence. Worse still, the banalization of nihilism creates an environment where ideas can be imposed forcibly with little resistance, raw power alone determining intellectual and moral hierarchies. It's a conclusion that dovetails nicely with Nietzsche's, who pointed out that all interpretations of the world are simply manifestations of will-to-power.

Conclusion

It has been over a century now since Nietzsche explored nihilism and its implications for civilization. As he predicted, nihilism's impact on the culture and values of the 20th century has been pervasive, its apocalyptic tenor spawning a mood of gloom and a good deal of anxiety, anger, and terror. Interestingly, Nietzsche himself, a radical skeptic preoccupied with language, knowledge, and truth, anticipated many of the themes of postmodernity. It's helpful to note, then, that he believed we could--at a terrible price--eventually work through nihilism. If we survived the process of destroying all interpretations of the world, we could then perhaps discover the correct course for humankind:

> I praise, I do not reproach, [nihilism's] arrival. I believe it is one of the greatest crises, a moment of the deepest self-reflection of humanity. Whether man recovers from it, whether he becomes master of this crisis, is a question of his strength. It is possible. . . . (*Complete Works* Vol. 13)

Noncognitivism

In Ethical theory, noncognitivism is the view that moral utterances are neither true nor false statements about the world. They are, instead, expressions of feelings or prescriptive utterances. The key to this issue is distinguishing between two types of utterances: (1) propositional utterances, and (2) nonpropositional utterances. Propositional utterances are either true or false statements about the world, such as the following:

- **The door is brown**
- **The house is on fire**
- **Jones claims to have seen Elvis**
- **Smith is wearing his leisure suit again**

To test for whether the statement "the door is brown" is propositional, we need only to ask, "Is it true or false that 'the door is brown?'" Since this question is intelligible, then the statement, "the door is brown" is propositional. Nonpropositional sentences, by contrast, are utterances which are not propositional. Examples of these are,

- **What time is it?**
- **Keep your dog out of my yard!**
- **Oh, my aching back!**
- **Three cheers for Old Glory!**

Although we understand what is being said by each of these utterances, they are neither true nor false statements about the world. For example, it makes no sense to ask, "Is it true or false that 'what time is it?'" Nonpropositional utterances include questions (such as "what time is it?"), commands (such as "keep your dog out of my yard!"), and expressions of feelings (such as "oh my aching back!").

Consider the following list of moral utterances:

- **Jones is a good man**
- **Charity is good**
- **Smith is a bad man**
- **Murder is wrong**

The traditional view of moral utterances is that they are propositional, since it seems intelligible to ask, "is it true or false that 'Jones is a good man'?" This traditional view is called cognitivism since it is suggested that the truth value of moral utterances can be known (or subject to cognition). Logical positivism challenges cognitivism arguing that, although moral statements may appear to be true or false statements about the world, they are not really propositional. Instead, they are nonpropositional utterances which are disguised as propositions. This view is called noncognitivism

since it contends that the truth value of moral utterances cannot be known (or subject to cognition).

One version of noncognitivism, called emotivism, associated with C.L. Stevenson, suggests that moral utterances are primarily nonpropositional expressions of our feelings, such as "Three cheers for Old Glory!" The statement, "Jones is a good man" simply expresses our approval of Jones, and could be reworded more accurately as "Three cheers for Jones!" Another version of noncognitivism, called prescriptivism, associated with R.M. Hare, contends that moral utterances are primarily nonpropositional commands, such as "Keep your dog out of my yard!" The statement, "Murder is wrong," is primarily a command intended to discourage people from murdering. This, too, could be more accurately reworded as, "Don't murder!"

The strongest defense of noncognitivism is to question the reference of moral predicates in statements such as "Jones *is a good man*". For, if such a statement is propositional (or cognitive) it must refer to something. However, it does not appear to mirror the world of facts as does a factual claim such as "Jones is a bald man." On the other hand, moral utterances are not complete nonsense, such as "I hear the color green." A noncognitivist interpretation of moral utterances is therefore the only remaining alternative.

Objectivity

The word "objectivity" refers to the view that the truth of a thing is independent from the observing subject. The notion of objectivity entails that certain things exist independently from the mind, or that they are at least in an external sphere. Objective truths are independent of human wishes and beliefs. The notion of objectivity is especially relevant to the status of our various ideas, and the question is to what extent objectivity is possible for thought, and to what extent it is necessary.

In epistemology, the objectivist position is that truth independent of the individual; this follows the correspondence theory of truth. However, idealists use 'objectivity" to designate that existence in thought is the only kind of real existence. In metaphysics, Plato identifies objectivity as pertaining to the world of the forms. For Plato, the forms reside in a separate world, which is invisible to our sense, although obtainable through reason. Thus, Plato refers to real objects the "knowable forms" which include the objective truths of justice, beauty, truth, and love.

Philosophers of the modern period concede the reality of the objective realm, although argue that it is unattainable. This is so of Locke's account of the a thing's substance, and Kant's view that our knowledge is restricted to the phenomenal realm, with no direct access to things in themselves.

In this century, Richard Rorty distinguishes between two notions of "objectivity." One involves the correspondence with what is out there, and is supposedly discovered by an algorithm. This Rorty rejects as since we have no idea how to perform this task. His second notion of "objective" involves those considerations adopted by a consensus of rational discussants. This, he believes, is the most objectivity we can hope for.

William of Ockham (d. 1347)

LIFE. William of Ockham, the Franciscan school man, nominalist, and "*doctor invincibilis,*" was born at Ockham in 1280 and died in Munich on April 10, 1349. Of his early life, little is known. From the scarce data, it may be concluded that he entered the Franciscan order at an early age. He received his bachelor's degree at Oxford, and his master's at Paris, where he taught from a date between 1315 and 1320. The tradition that he was a pupil of Duns Scotus is probably correct. There is no evidence that he returned to England and taught at Oxford. In any case, it is with Paris that his principal teaching activity is connected. His doctrines had taken such hold there by 1339 that the philosophical faculty felt obliged to issue a warning against them. By that time he himself had left Paris. The question of poverty which so deeply agitated his order determined the later course of his life. He threw all his strength into the defense of the ideal of absolute poverty. But it was not long before their common ground of opposition to the pope drew the extreme Franciscans together with the Emperor Louis the Bavarian, the opponent of John XXII. At the chapter of the order in Perugia, Ockham and Bonagratia were the chief supporters of the general Michael of Cesena. They supported his strict views, and afterward they spent some time in the dioceses of Ferrara and Bologna, urgino, considering the absolute poverty of Christ and the apostles as a necessary ideal. In December, 1323, he was summoned with some others to appear before the pope at Avignon, and was imprisoned there for over four years. On May 25, 1328, Michael of Cesena and Bonagratia made his escape and fled to Italy. Deposed and excommunicated, they made common cause with the emperor, who was then in Italy. In 1329 a general chapter held in Paris deposed Michael of Cesena from his office, and two years later he and his adherents were expelled from the order. Ockham became one of the emperor's principal advisers and literary defenders. The political ideas which he had already represented in Paris were now developed and adapted to the circumstances of the time. In stepping outside the range of pure theology, he never forgot that he was a theologian. The belief that John XXII. was a heretic and no true pope, that the poverty of Christ and the apostles was an article of faith, were as much a part of his fixed belief as that the State and the rights of the emperor were independent of pope and Church. After the unfortunate issue of Louis' visit to Rome, the Franciscans followed him to Munich in Feb., 1330 and took up their abode in a neighboring house of the order, where most of the political writings of Ockham were composed. In 1342 Michael of Cesena died, transmitting the seal of the order and his claims to its headship to Ockham. The death of Louis on Oct. 11, 1347 , the loss of some of the Munich group, and the reconciliation of the new Emperor Charles IV. with the papacy, left Ockham increasingly alone. Eventually, the time came when he was the only one of the old leaders left. He was once more cited in 1349 before the papal tribunal, but the negotiations came to naught with his refusal to admit that Louis was a heretic and schismatic. Clement VI. demanded that the order should take action. A chapter held in Whitsuntide, 1349, asserted that but few brothers remained who had supported Michael of Cesena and Louis; that " William the Englishman," who was prominent among these, had sent back the seal of the order to the general, and that he and the

others, while they could not conveniently appear in Rome, petitioned for release from their excommunication. On June 8, 1349, The pope offered to grant this request on condition of their subscribing a formula which was somewhat less stringent than that which had been usual since John XXII. Trithemius, Wadding, and others assert that Ockham signed this and was absolved. However, there is no documentary evidence to this effect, and Jacobus de Marchia says expressly that the three principal leaders "remained excommunicated heretics." This is more probably the case, whether Ockham remained inflexible or death intervened too soon to allow his acceptance of the terms of peace. The date of his death is uncertain; he was undoubtedly alive in the spring of 1349, and thus the date given on his monument (of later construction) in the former Franciscan chapel at Alunich (April 10, 1347) cannot be right. The day and month may be accepted, but the year will be either 1350, or more probably 1349. This would account for the theory that he had announced his readiness to make submission, but died before it could be accomplished.

WRITINGS. There is no complete edition of the works of Ockham, which can serve as an indicator of the disfavor into which he fell by his rebellious attitude. Although the numerous manuscripts and early printed editions testify to the interest which was felt in his writings. Under the head of philosophical works may be named the *Expositio aurea et admodum utilis super totam artem veterem*. This work, in the form of commentaries on Aristotle and Porphyry, contains Ockham's logic, epistemology, metaphysic, *Summa logices, Qucestiones in octo libros physicorum, Summultv in libros physicorum,* and two or three works still unprinted. The principal theological work is *Quoestiones et decisiones in quatuor libros sententiarum*. The first book is much fuller than the other three and is frequently found in manuscripts independent of them. This leads us to believe that Ockham published it before the other three and on a much larger scale. Other theological treatises are the *Centiloquium theologicum,* "embracing almost the whole of speculative theology under one hundred conclusions," which gives a interesting collection of instances of what rational theology might consider possible. *Quodlibeta septem*, deals with the principal problems of philosophy and theology, based probably on the disputations with which he began his Paris teaching. *De Sacramento altaris and De corpore Christi*, two parts of one work, which was used to supply theoretical support for Luther's eucharistic doctrine (*De prcedestinatione et futuris contingentibus*).

NOMINALISM. The great revival of philosophical and theological study which the thirteenth century witnessed was conditioned by the influence of Aristotle. The theory of the universe propounded by the Stagirite had to be reconciled with the traditional Platonic-Augustinian realism. This Thomas Aquinas undertook to do, following, Aristotle as closely as possible. Duns Scotus, on the other hand, attempted to maintain the ancient realism, while supporting it by modern or Aristotelian methods. Interests and tendencies, however, came up in his work which drove his disciples away from his position. The growth of empirical research and psychological analysis together with the new activity of the reason in the epistemological field on the one side, and the recognition of the fact that the specific and the particular was the end of nature on the other, led to results widely divergent from those of Scotus. Here was Ockham's work ready to his hand. He was the leader of the nominalists, the founder of the "modern" school. Science has to do, he maintains, only with propositions, not with things as such, since the object of science is not what is but what is known. Things, too, are always singular, while science has to do with general concepts, which as such exist only in the human mind. Scotus had deduced the objective existence of universals from the concepts originated under the operation of the objects. Ockham, on the other hand, asserts that "no universal is a substance existing outside of the mind," and proves it by

a variety of keen logical reasons. He rejects even the milder forms of philosophic universalism, such as the theory that the universal is something in particulars which is distinguished from them not *realiter* but only *formaliter*. He considers the universal without qualification as an "intention" of the mind, a symbol representing conventionally several objects. In respect of the theory of cognition, where Duns Scotus had placed between the perceiving subject and the object perceived a "sensible species" and an "intelligible species," Ockham considers these as superfluous machinery. Objects call forth sense-impressions in us, which are transmuted by the active intellect into mental images. These images are thus a product of the intellect, not *species* which flow from the object into the *intellectus possibilis*. The reality of these images is thus, in the modern use of the terms, not objective but subjective. This is true not merely of the "terms of first intention" formed directly from sense-impression, but also of the "terms of second intention," i.e., the abstract terms which take note of common attributes, or universals. These latter correspond to a tendency of the human mind, which can not perceive individuals without at the same time attempting to form a general concept. A white object simultaneously suggests abstract whiteness; an extended, related, enduring object forces the conception of extension, relation, duration. The result of this line of reasoning is the absolute subjectivity of all concepts and universals and the limitation of knowledge to the mind and its concepts-although these are real entities because of their subjective existence in the mind, reproducing the actual according to the constitution of the mind. Thus Ockham is really the pioneer of modern epistemology. The mysterious universals with their species in the sense of objective realities are abolished. Objects work upon the senses of men, and out of these operations the active intellect frames its concepts, including the so-called universals, which, while they are in themselves subjective, yet correspond to objective realities. By the statement that science has nothing to do directly with things, but only with concepts of them, the theory of knowledge assumes vital import for the progress of science, and a new method of scientific cognition is made available. Of course this increases the difficulty of the task of theology. However, Ockham was essentially of a skeptical and critical temperament, of great critical acumen, but (especially in the religious province) he was by no means equally great in constructive ability. He did not have the broad general conception of religion which guided his master Scotus through his attempts to criticize the old evidences and bring up new ones. Where Ockham shows its power at all, it is usually simply borrowed from Scotus.

NATURE OF GOD. In regard to the nature and attributes of God, he applies a critical solvent to the principal proof given by Scotus for God's existence. Ockham shows that the reality of God as the *infinitus intensive* can as little be demonstrated from *efficientia, causalitas, eminentia*, as from the divine knowledge of the infinite or from the simplicity of his nature. Nevertheless, he considers the recognition of God to proceed from the idea of causality. If not by strict syllogistic deduction, then " by authority and reason." In the same sort of way, the infinity of God is confirmed. As to his unbounded power and absolute will, Ockham distinguishes *potentia absolute* and *potentia ordinate*, the two being, however, only different modes of considering a power which is essentially one. In practice it is always *ordinate*, the absolute power being merely the hypothetical possibility of God's doing anything whatever which does not involve a contradiction in terms. The absolute freedom of God is the characteristic trait in the theology of Ockham. The entire scheme of salvation planned by the *voluntas ordinate* is based on no inner necessity, but is determined by the fact that it pleased God. As a matter of fact, to please God and nothing else. The distinction of the two aspects of the divine power comes in here. The merits of the saints, e.g., are accepted as valid only because it pleases God to accept them-but since it has pleased God to establish this system, merit is absolutely

necessary. God and his grace do all, yet only in such a way that the cooperation of man is required. The freedom of the human will cannot be, strictly speaking, demonstrated, but is recognized as true by experience. Sin consists in the violation of the will of God. By it, however, no "real" change takes place in the soul. Sin consists in individual acts; it does not take away freedom nor weaken the soul, but simply destroys the future good, the reward, ordained by God for those who do his will. Since there is no fundamental connection between sin and punishment, God could by his absolute power forgive sin and infuse grace even without repentance. In the same connection appears the relation of original sin to original righteousness. The latter is "an absolute something superadded to man as he is in a state of nature"; the former is "a certain lack of the righteousness which he ought to have." Thus original sin is the result of the divine ordinance; God wills to consider the offender against his law as unworthy of acceptance, together with all his posterity. This explains his view of the immaculate conception of Mary. As a member of the human race, she would have been in the first instant of her conception a debtor to original righteousness. However, it is not inconceivable that God should have chosen to renounce the exaction of that righteousness from her and refused to impute its absence as a fault. By a subtle train of reasoning he concludes that she was not even for an instant in original sin.

REASON AND AUTHORITY. According to his attitude toward the dogmas of the Church, it appears that "authority, reason, and experience" are the sources of religious knowledge. A scientific proof of dogma is impossible. This he shows by the method of evolving a number of propoitions which on ecclesiastical principles ought to be possible, but actually contradict the doctrine of the Church. The instances are frequently rather startling; but it would be quite misleading to understand them in the sense of anti-ecclesiastical unbelief or frivolous skepticism. Ockham's purpose is to show that reason is useless as a foundation of ecclesiastical dogma. The infidel can " attain all the knowledge, whether simple or complex, which the believer can have"; the difference is in the possession of faith. The act of belief depends on the *fides infusa,* and proceeds from the cooperation of this with the *fides arquisita* derived from instruction, Bible-reading, and intelligent meditation on various truths. Theology is not thus in the strict sense a science; it is not a form of natural metaphysical cognition, but a special mode of cognition effected by the operation of the infused "habit" of faith. In the application of these principles to the faith of the church of his day, Ockham accepts and even enhances the ecclesiastical positivism of Scotus. The faith of the Church must be accepted *in toto*, either explicitly or implicitly. Reason may question the doctrines or ordinances of the Church, but the Christian as a Christian accepts them. The more critical activity awoke, the more need there was for this counterbalancing thought. The legal conception of the Church finds expression here; he who wishes to belong to it must subject himself to its laws, whether or not he is personally convinced of their justice. Here again there is need of the miraculous *fides infusa*. However, this is itself an article of faith which is learned only by authority, not "by reason, by experience, or by logic." So it comes back to the point that a man must accept the teachings of the Church because he wishes to belong to it. The authority of the Church's teaching was essentially based, for Ockham, on that of the Bible. This in itself was nothing new, as all the scholastics (following Augustine) had regarded church doctrine as the formulated expression of Scriptural truth. The novelty here is that Ockham is driven by the party conflicts of his day into acknowledging that the authorities of the day may diverge from Scriptural teaching. Thus he comes to a more consciously strict application of the principle of Scriptural infallibility. Popes and councils may err, but the written word is sure. "A Christian is not bound to believe, as necessary to salvation, anything which is neither contained in the Bible nor may be

plainly and of necessity inferred from what is contained there." It is true that he does not realize how far this principle might lead, or how far it was one day going to lead Luther. He also does not seem disposed to apply it except where the necessities of his own position, as in the controversy on poverty, forced him to it. In practice, throughout his whole dogmatic system, the authority of the Fathers and of the Roman Catholic Church stands out as coequal with that of the Scripture. In fact, the Church has the last word, and the doctrine of transubstantiation (which is not expressly taught in Scripture) is unquestioningly accepted on that authority.

CHRISTOLOGY. In his Christology, Ockham holds firmly to the hypostatic union, while distinguishing sharply between the two natures. As with Duns Scotus, so here the union consists in a "relation," the human nature being assumed by the divine. The special result of Christ's work is to be seen in the institution and operation of the sacraments. The operation is described in a manner usual in Franciscan theology; grace does not reside in them, but they are signs that God, in accordance with his institution, will accompany their administration with his grace. Grace is taken in a twofold sense, an infused quality of the mind by which man is enabled to act according to God's will, and divine acceptation, "the gratuitous will of God." Following Scotus again, Ockham is conscious of strong objections to the doctrine of the necessity of an infused "habit" of grace; and it is quite clear that the retention of it in his system is due merely to submission to authority. Under the head of the sacraments, his fullest treatment is given to the Eucharist, where he follows the consubstantiation theory which after Scotus was becoming common. Neither Scripture nor reason contradicts the possibility of the substance of bread, not merely the accidents, remaining together with the substance of the body of Christ; nor is transubstantiation taught in Scripture. He goes at considerable length into the question of the possibility of the presence of Christ in the sacrament. For him as a nominalist, quantity is a thing which has no existence in itself, but only the *res quanta*. Now quantity can increase or diminish, and thus a thing may be without quantity, like a mathematical point; this is the manner in which the body of Christ exists in the sacrament of the altar. In this way he comes to agree with Thomas Aquinas, that the body of Christ is present "after the manner of substance, not after that. of quantity" (Summa, III., lxxvi. 1). The criticism of Duns Scotus, that a substance without attributes is unthinkable, is avoided by the assertion that quantity is not an essential property of substance. While to some extent he prepared the way for Luther's teaching on the Lord's Supper, the difference between his doctrine of ubiquity and Luther's must not be overlooked. As to the sacrament of penance, like most of the later scholastics, Ockham lays most stress on the absolution. Since, as shown above, sin effects no "real" change in the soul, its destruction consists in the non-imputation of guilt. This might have been brought about, had God so willed, by an internal act of repentance on the part of a sinner having proper dispositions. Sin being an act of the will, the detestation of it by the same will is the appropriate means for its destruction, and in fact necessary, contrary to the view of Scotus that God gives his grace to the sinner through the sacrament without either attrition or contrition. But the essence of the sacrament, according to Ockham, lies in the deliverance of the sinner from the guilt of sin by God through the agency of the priest.

CHURCH AND STATE. In the important questions as to the external organization of the Church and its relation to the State, two principal motives guided Ockham to his conclusions. Accusing John XXII. of attempting to subjugate or destroy the empire and to prove erroneous and illicit the thorough-going poverty of the Franciscans, he met him by attempting on the one hand to make a sharp distinction between the Church and the world, and on the other by showing the limitations and errors of the official ecclesiastical authorities. Like Marsilius of Padua, he contends that the

papal power extends only to spiritual things. The apostles were subject to the secular authorities of their time and were far from claiming any temporal jurisdiction. Even the necessity of the papacy may be called in question; and if so, much less is there any necessary dependence of the emperor on the pope. The choice of the electors makes an emperor, who needs no papal confirmation. The relation of pope and emperor is discussed not only from the standpoint of the historic civil law, but from that of natural law as well. The idea of natural law had come down from the ancients to both canonists and civilians, as a criterion of the justice of positive enactments; the popes had employed it often enough against civil rulers, and now it was turned against themselves. The trouble with this criterion, however, was that it was too elastic; it could be stretched to include the most revolutionary conclusions in both Church and State. Ockham undoubtedly believed in the logical validity of his critical statements; but a complete overturning of the ecclesiastical organism was as far from his temperament as the creation of a new system of Scriptural theology. He never strove for anything more than a certain amelioration of existing conditions within the circle of the system, and his most reasonable demands went to pieces on the positivism of the nominalist. He was anything but timid; but he went on criticizing and constructing, and then doubting once more both his critical and his constructive work.

IEP

The Internet Encyclopedia of Philosophy

Ordinary Language

Ordinary language philosophy the philosophical study of everyday language of life spoken by the average individual. It is a contemporary movement started in large part by Wittgenstein, although Locke and G.E. Moore are credited with setting its background. John Wisdom, Gilbert Ryle, P.F. Stawson, J.O. Urmson, Norman Malcolm, and J.L. Austin are all contributors to ordinary language philosophy.

Ordinary language philosophy is a reaction against reformists such as Russell who claim that ideal language is needed to avoid the ambiguities, vagueness and vacuousness of terms. Ordinary language philosophers argue that this does not clarify the problem, but makes the language more remote and problematic. By contrast, ordinary language philosophy examines the way common language is used, and critiques the technical speech or jargon used when discussing philosophical problems. Even certain everyday terms become misused in philosophical language. Thus, many classic philosophical problems can be solved by returning to the use of the everyday meanings of words.

Origen (182-251)

LIFE: Origen, one of the most distinguished of the Fathers of the early Church, was born, probably at Alexandria, about 182; and died at Caesarea not later than 251. His full name was apparently Origenes Adamantius; and he received from his father, Leonides, thorough instruction in the Bible and in elementary studies. But in 202 the outbreak of the persecution of Septimius Severus robbed Origen of his father, whom he sought to follow in martyrdom, being prevented only by a ruse of his mother. The death of Leonides left the family of nine impoverished, their property being confiscated. Origen, however, was taken under the protection of a woman of wealth and standing; but as her household already included a heretic named Paul, the strictly orthodox Origen seems to have remained with her but a short time. Since his father's teaching enabled him also to give elementary instruction, he revived, in 203, the catechetical school at, whose last teacher, Clement, was apparently driven out by the persecution. But the persecution still raged, and the young teacher unceasingly visited the prisoners, attended the courts, and comforted the condemned, himself preserved from harm as if by a miracle. His fame and the number of his pupils increased rapidly, so that Demetrius, bishop of Alexandria, made him restrict himself to instruction in Christian doctrine alone. Origen, to be entirely independent, sold his library for a sum which netted him a daily income of 4 obols (about twelve cents) on which he lived by exercising the utmost frugality. Teaching throughout the day, he devoted the greater part of the night to the study of the Bible and lived a life of rigid asceticism. This he carried to such an extent that, fearing that his position as a teacher of women as well as men might give ground for scandal to the heathen, he followed literally Matt. xix. 12, partly influenced, too, by his belief that the Christian must follow the words of his Master without reserve. Later in life, however, he saw reason to judge differently concerning his extreme act.

During the reign of Caracalla, about 211-212, Origen paid a brief visit to Rome, but the relative laxity under the pontificate of Zephynintis seems to have disillusioned him, and on his return to Alexandria he resumed his teaching with zeal increased by the contrast. But the school had far outgrown the strength of a single man; the catechumens pressed eagerly for elementary instruction, and the baptized sought for interpretation of the Bible. Under these circumstances, Origen entrusted the teaching of the catechumens to Heraclas, the brother of the martyr Plutarch, his first pupil. His own interests became more and more centered in exegesis, and he accordingly studied Hebrew, though there is no certain Knowledge concerning his instructor in that language. From about this period (212-213) dates Origen's acquaintance with Ambrose of Alexandria, whom be as instrumental in converting from Valentianism to orthodoxy. Later (about 218) Ambrose, a man of wealth, made a formal agreement with Origen to promulgate his writings, and all the subsequent works of Origen (except his sermons, which were not expressly prepared for publication) were dedicated to Ambrose. In 213 or 214 Origen visited Arabia at the request of the prefect, who wished to have an interview with him; and Origen accordingly spent a brief time in Petra, after which he returned to Alexandria. In the following year (215), a popular uprising at

Alexandria caused Caracalla to let his soldiers plunder the city, shut the schools, and expel all foreigners. The latter measure caused Ambrose to take refuge in Caesarea, where he seems to have made his permanent home; and Origen, who felt that the turmoil hindered his activity as a teacher and imperiled his safety, left Egypt, apparently going, with Ambrose to Caesarea, where he spent some time., Here, in conformity with local usage based on Jewish custom, Origen, though not in orders, preached and interpreted the Scriptures at the request of the bishops Alexander of Jerusalem and Theoctistus of Caesarea. When, however, the confusion in Alexandria subsided, Demetrius recalled Origen, probably in 216. Of Origen's activity during the next decade little is known, but it was obviously devoted to teaching and writing. The latter was rendered the more easy for him by Ambrose, who provided him with more than seven stenographers to take dictation in relays, as many scribes to prepare long-hand copies, and a number of girls to multiply the copies. At the request of Ambrose, he now began a huge commentary on the Bible, beginning with John, and continuing with Genesis, Ps. i.-xxv., and Lamentations, besides brief exegeses of selected texts (forming the ten books of his Stromateis), two books on the resurrection, and the work "On First Principles."

About 230, Origen entered on the fateful journey which was to compel him to give up his work at Alexandria and embittered the next years of his life. Sent to Greece on some ecclesiastical mission, he paid a visit to Caesarea, where he was heartily welcomed and was ordained presbyter, that no further cause for criticism with might be given Demetrius, who had strongly disapproved his preaching before ordination while at Caesarea. But Demetrius, taking this well-meant act as an infringement of his rights, was furious, for not only was Origen under his jurisdiction, but, if Eastern sources may be believed, Demetrius had been the first to introduce episcopal ordination in Egypt. The metropolitan accordingly convened a synod of bishops and presbyters which banished Origen from Alexandria, while a -second synod declared his ordination invalid. Origen accordingly fled from Alexandria in 231, and made his permanent home in Caesarea. A series of attacks on him seems to have emanated from Alexandria, whether for his self-castration (a capital crime in Roman law) or for alleged heterodoxy is unknown; but at all events these fulminations were heeded only at Rome, while Palestine, Phoenicia, Arabia, and Achaia paid no attention to them. At Alexandria Heraclas became head of Origen's school, and shortly afterward, on the death of Demetrius, was consecrated bishop. At Caesarea Origen was joyfully received was also the guest in Cappadocia, and Julia Mammaaea, at Antioch. The former also visited him at Caesarea, where Origen, deeply loved by his pupils, preached and taught dialectics, physics, ethics, and metaphysics; thus laying his foundation for the crowning theme of theology. He accordingly sought to set forth all the science of the time from the Christian point of view, and to elevate Christianity to a theory of the universe compatible with Hellenism. In 235, with the accession of Maximinus, a persecution raged; and for two years Origin is said, though on somewhat doubtful authority, to have remained concealed in the house of a certain Juliana in Caesarea of Cappadocia. Little is known of the last twenty years of Origen's life. He preached regularly on Wednesdays and Fridays, and later daily. He evidently, however, developed an extraordinary literary productivity, broken by occasional journeys; one of which, to Athens during some unknown year, was of sufficient length to allow him time for research. After his return from Athens, he succeeded in converting Beryllus, bishop of Bostra, from his adoptianistic views to the orthodox faith; yet in these very years (about 240) probably occurred the attacks on Origen's own orthodoxy which compelled him to defend himself in writing to the Roman pontiff Fabiail (236-250) and many bishops. Neither the source nor the object of these attacks is known, though the latter may have been connected with

Novatianism. After his conversion of Beryllus, however, his aid was frequently invoked against heresies. Thus, when the doctrine was promulgated in Arabia that the soul died and decayed with the body, being restored to life only at the resurrection, appeal was made to Origen, who journeyed to Arabia, and by his preaching reclaimed the errina. In 250 persecutions of the Church broke out anew, and this time Origen did not escape. He was tortured pilloried, and bound hand and foot to the block for days without yielding. These tortures seem to have resulted in his death. A later legend, recounted by Jerome and numerous itineraries place his death and burial at Tyre, but to this little value can be attached.

WRITINGS. According to Epiphanius, Origen wrote about 6,000 works (i.e., rolls or chapters). A list was given by Eusebius in his lost life of Pamphilus, which was apparently known to Jerome. These fall into four classes: text criticism; exegesis; systematic, practical, and apologetic theology; and letters; besides certain spurious works. By far the most important work of Origen on textual criticism was the Hexapla. Of the fate of the Hexapla nothing is known. The exegetical writings of Origen fall into three classes: scholia, or brief summaries of the meaning of difficult passages; homilies; and " books," or commentaries in the strict sense of the term. Homilies on almost the entire Bible were prepared by Origen, these being taken down after his sixtieth year as he preached. It is probable that Origen gave no attention to supervising the publication of his homilies, for only by such a hypothesis can the numerous evidences of carelessness in diction be explained. The exegesis of the homilies was simpler than that of the scientific commentaries, but nevertheless demanded no mean degree of intelligence from the auditor. Origen's chief aim was the practical exposition of the text, verse by verse; and while in such barren books as Leviticus and Numbers he sought to allegorize, the wealth of material in the prophets seldom rendered it necessary for him to seek meanings deeper than the surface afforded. Whether the sermons were delivered in series, or the homilies on a single book were collected from various series, is unknown. The object of Origen's commentaries was to give an exegesis that discriminated strictly against the incidental, unimportant historical significance, in favor of the deeper, hidden, spiritual truth. At the same time, he neglected neither philological nor geographical, historical' nor antiquarian material, to all of which he devoted numerous excursuses. In his commentary on John he constantly considered the exegesis of the Valentinian Heracleon (probably at the instance of Ambrose), and in many other places he implied or expressly cited Gnostic views and refuted them. Unfortunately, only meager fragments of the commentaries have survived. Among the systematic, practical, and apologetic writings of Origen, mention should first be made of his work " On First Principles," perhaps written for his more advanced pupils at Alexandria and probably composed between 212 and 215. It is extant only in the free translation of Rufinus, except for fragments of the third and fourth books. After his removal to Caesarea, Origen wrote the works, still extant, " On Prayer," " On Martyrdom," and " Against Celsus." Eusebius had a collection of more than one hundred letters of Origen, and the list of Jerome speaks of several books of his epistles.

PHILOSOPHICAL VIEWS. Origen, trained in the school of Clement and by his father, was essentially a Platonist with occasional traces of Stoic philosophy. He was thus a pronounced idealist, regarding all things temporal and masophical and terial as insignificant and indifferent, the only real and eternal things being comprised in the idea. He therefore regards as the purely ideal center of this spiritual and eternal world, God, the pure reason, whose creative powers call into being the world with matter as the necessary substratum. Likewise Platonic is the doctrine that those spirits capable of knowing supreme reason, but imprisoned in the body in this world, will rise after death to divinity, being purified by fire. In his attempt to amalgamate the system

evolved by Greek thought with Christianity, Origen found his predecessors in the Platonizing Philo and even in the Gnostics. His exegesis does Dot differ generally from that of Heracleon, but in the canon of the New Testament and in the tradition of the Church, Origen possessed a check which kept him from the excesses of Gnostic exegesis. He was, indeed, a rigid adherent of the Bible, making no statement without adducing some Scriptural basis. To him the Bible was divinely inspired, as was proved both by the fulfillment of prophecy and by the immediate impression which the Scriptures made on him who read them. Since the divine I,ogos spoke in the Scriptures, they were an organic whole and on every occasion he combated the Gnostic tenet of the inferiority of the Old Testament. He was aware of the discrepancies between the Old and New Testaments and the contradictory accounts of the Gospels; but he considered these only as inconsistencies that lend themselves to a unspiritual historical exegesis according to the letter In his exegesis, Origen sought to discover the deeper meaning implied in the Scriptures. One of his chief methods was the translation of proper names which enabled him, like Philo, to find a deep meaning even in every event of history; but at the same time he insisted on an exact grammatical interpretation of the text as the basis of all exegesis. A strict adherent of the Church, Origen yet distinguished sharply between the ideal and the empirical Church representing " a double church of men and angels," or, in Platonic phraseology, the lower church an its celestial ideal. The ideal Church alone was the Church of Christ, scattered over all the earth; the other provided also a shelter for sinners. Holding that the Church, as being in possession of the mysteries, affords the only means of salvation, he was indifferent to her external organization, although he spoke sometimes of the office-bearers as the pillars of the Church, and of their heavy duties and responsibilities. More important to him was the idea borrowed from Plato of the grand division between the great human multitude, capable of sensual vision only, and those who know how to comprehend the hidden meaning of Scripture and the diverse mysteries; church organization being for the former only. It is doubtful whether Origen possessed an obligatory creed; at any rate, such a confession of faith was not a norm like the inspired word of Scripture. The reason, illumined by the divine Logos, which is able to search the secret depths of the divine nature, remains as the only source of knowledge.

NATURE OF GOD. Origen's conception of God is entirely abstract. God is a perfect unity, invisible and incorporeal, transcending all things material, and therefore inconceivable and incomprehensible. He is likewise unchangeable, and transcends space and time. But his power is limited by his goodness, justice, and wisdom; and, though entirely free from necessity, his goodness and omnipotence constrained him to reveal himself. This revelation, the external self-emanation of God, is expressed by Origen in various ways, the Logos being only one of many. Revelation was the first creation of God (cf. Prov. viii. 22), in order to afford creative mediation between God and the world, such mediation being necessary, because God, as changeless unity, could not be the source of a multitudinous creation. The Logos is the rational creative principle that permeates the universe. Since God eternally manifests himself, the Logos is likewise eternal. He forms a bridge between the created and uncreated, and only through him, as the visible representative of divine wisdom, can the inconceivable and incorporeal God be known. Creation came into existence only through the Logos, and God's nearest approach to the world is the command to create. While the Logos is substantially a unity, be comprehends a multiplicity of concepts, so that Origen terms him, in Platonic fashion, "essence of essences" and "idea of ideas." The defense of the unity of God against the Gnostics led Origen to maintain the subordination of the Logos to God, and the doctrine of the eternal generation is later. Origen distinctly emphasized the independence of the

Logos us well as the distinction from the being and substance of God. The term " of the same substance with the Father " was not employed. He is merely an image, a reflex not to be compared with God; as one among other " gods," of course first in rank.

THE LOGOS AND COSMOLOGY. The activity of the Logos, was conceived by Origen in Platonic fashion, as the world soul, wherein God manifested his omnipotence. His first creative act was the divine spirit, as an independent existence; and partial reflexes of the Logos were the created rational beings, who, as they had to revert to the perfect God as their background, must likewise be perfect; yet their perfection, unlike in kind with that of God, the Logos, and the divine spirit, bad to be attained. The freedom of the will is an essential fact of the reason, notwithstanding the foreknowledge of God. The Logos, eternally creative, forms an endless series of finite, comprehensible worlds, which are mutually alternative. Combining the Stoic doctrine of a universe without beginning with the Biblical doctrine of the beginning and the end of the world, he conceived of the visible world as the stages of an eternal cosmic process, affording also an explanation of the diversity of human fortunes, rewards, and punishments. The material world, which at first had no place in this eternal spiritual progression, was due to the fall of the spirits from God the first being the serpent, who was imprisoned in matter and body. The ultimate aim of God in the creation of matter out of nothing was not punishment, but the upraising of the fallen spirits. Man's accidental being is rooted in transitory matter, but his higher nature is formed in the image of the Creator. The soul is divided into the rational and the irrational, the latter being material and transitory, while the former, incorporeal and immaterial, possesses freedom of the will and the power to reascend to purer life. The strong ethical import of this cosmic process can not remain unnoticed. The return to original being through divine reason is the object of the entire cosmic process. Through the worlds which follow each other in eternal succession, the spirits are able to return to Paradise. God so ordered the universe that all individual acts work together toward one cosmic end which culminates in himself. Likewise as to Origin's anthropology, man conceived in the image of God is able by imitating God in good works to become like God, if he first recognizes his own weakness and trusts all to the divine goodness. He is aided by guardian angels, but more especially by the Logos who operates through saints and prophets in proportion to the constitution of these and man's capacity.

CHRISTOLOGY. The culmination of this gradual revelation is the universal revelation of Christ. In Christ, God, hitherto manifest only as the Lord, appeared as the Father. The incarnation of the Logos, moreover, was necessary since otherwise he would not be intelligible to sensual man; but the indwelling of the Logos remained a mystery, which could be represented only by the analogy of his indwelling in the saints; nor could Origen fully explain it. He speaks of a " remarkable body," and in his opinion that the mortal body of Jesus was transformed by God into an ethereal and divine body, Origen approximated the Docetism that he otherwise abhorred. His concept of the soul of Jesus is likewise uncertain and wavering. He proposes the question whether it was not originally perfect with God but, emanating from him, at his command assumed a material body. As lie conceived matter as merely the universal limit of created spirits, so would it be impossible to state in what form the two were combined. He dismissed the solution by referring it to the mystery of the divine governance of the universe. More logically did he declare the material nature of the world to be merely an episode in the spiritual process of development, whose end should be the annihilation of all matter and return to God, who should again be all in all. The doctrine of the resurrection of the body he upholds by the explanation that the logos maintains the unity of man's existence by ever changing, his body into new forms, thus preserving the unity and identity of

personality in harmony with the tenet of an endless cosmic process. Origen's concept of the Logos allowed him to make no definite statement on the redemptive work of Jesus. Since sin was ultimately only negative as a lack of pure knowledge, the activity of Jesus was essentially example and instruction, and his human life was only incidental as contrasted with the immanent cosmic activity of the Logos. Origen regarded the death of Jesus as a sacrifice, paralleling it with other cases of self-sacrifice for the general good. On this, Origen's accord with the teachings of the Church was merely superficial.

ESCHATOLOGY. His idealizing tendency to consider the spiritual alone as real, fundamental to his entire system, led him to combat the rude Chiliasm of a sensual beyond; yet be constrained himself from breaking entirely with the distinct celestial hopes and representations of Paradise prevalent in the Church. He represents a progressive purification of souls, until, cleansed of all clouds of evil, they should know the truth and God as the Son knew him, see God face to face, and attain a full possession of the Holy Spirit and, union with God. The means of attainment of this end were described by Origen in different ways, the most important of which was his Platonic concept of a purifying fire which should cleanse the world of evil and thus lead to cosmic renovation. By a further spiritualization Origen could call God himself this consuming fire. In proportion as the souls were freed from sin and ignorance, the material world was to pass away, until, after endless eons, at the final end, God should be all in all, and the worlds and spirits should return to a knowledge of God.

Original Position

The "Original Position" is a central concept in the political philosophy of John Rawls (b. 1921), which is most clearly set forth in his book *A Theory of Justice* (1971). Presenting a contemporary version of social contract theory, Rawls contends that in an original position, a group of rational and impartial people will establish a mutually beneficial principle of justice as the foundation for regulating all rights, duties, power, and wealth

THE ORIGINAL POSITION. Rawls sees his revived account of social contract theory as a direct challenge to utilitarianism. The key problem with utilitarianism is that an individual's rights may be violated if the consequences of doing so benefit societ y as a whole. Rawls believes his account of social contract-based justice avoids this problem. Rawls titles his view justice as fairness, which means that the rules of justice are agreed to in an initial contractual situation which is fair for all people involved. For Rawls, the starting point is the original position, which is a hypothetical community of people who are rational, equal, and self-interested. These people are not trying to start a new social system, but are seeking to establish a mutually b eneficial guideline which will reform and regulate all rights and duties within their system. In establishing this foundational guideline, the people see themselves behind a veil of ignorance. That is, they assume to be ignorant about their actual positio n in society (such as how rich they are). This assures that they (and their neighbors) will not create a foundational guideline which gives them special benefits. Rawls argues that the foundational guideline they adopt will be two rules of justice: one wh ich assures equal rights and duties for all, and a second which regulates power and wealth.

In the section titled "The Original Position and Justification," Rawls explains that the function of the contract is to etch out (or justify) a rule of justice which is most acceptable to the people concerned. Rival principles of justice should be we ighed according to what would be most acceptable to those involved in the contract. Rawls argues that his two principles of justice are clearly the most acceptable. He emphasizes that the original position is a state of impartiality and equality. It is im partial since, behind the veil of ignorance, there is no special consideration given to one's natural assets (such as education and wealth). It is also a state of equality since all have the same right in determining the foundational principle of justice. More precise circumstances of the original position are left unspecified. For, according to Rawls, the reader (who is outside of the original position) will also be able to evaluate the proposed principles of justice according to her common moral intuiti ons. She can then adjust the circumstances of the original position so that it gives rise to the notion of justice which conforms with her intuitions. This "going back and forth" from the original position to one's actual intuitions on justice is called r eflective equilibrium. However, Rawls argues that this does not involve an appeal to self-evident moral truths about justice.

PRINCIPLES OF JUSTICE. According to Rawls, the two principles of justice which will be arrived at in the original position are as follow:

- **Each person is to have an equal right to the most extensive basic liberty compatible with a similar liberty for others.**
- **Social and economic inequalities are to be arranged so that they are both (a) reasonably expected to be to everyone's advantage, and (b) attached to positions and offices open to all.**

The first principle generates specific rights and duties, such as those regarding speech, assembly, conscience, thought, property, arbitrary arrest, and political liberties of voting and holding office. The second principle regulates the fair distribution of wealth and power. To understand how these principles work, Rawls suggests that we start with the assumption that all rights, duties, wealth, and power are equally distributed. If certain inequalities would then make everyone better off, then these ine qualities are permissible according to the second rule above. For example, it is cumbersome for each citizen to have equal political control. Everyone benefits if political power is concentrated in the hands of a few, as with representative democracies. F or Rawls, any equality may be permitted (perhaps even slavery) so long as each person benefits from an inequality (including the slave). According to Rawls, this is the point which makes justice as fairness superior to utilitarianism. For, under utilitari anism, an individual slave's unhappiness does not matter, so long as general happiness is served by an inequality.

Rawls recognizes that Part A of the second principle is the most controversial aspect of his account. He calls this the difference principle. The difference principle has two implications. First, people with fewer natural assets (such as education an d wealth) deserve special considerations. Differences in natural assets are the result of what is sometimes called the natural lottery. Rawls argues that the natural lottery is arbitrary, and therefore the principle of redress dictates that we should comp ensate those with fewer natural assets. Second, Rawls argues that even rich people should agree to give up some wealth for the poor, since in the end they gain simply by being in a society of mutual cooperation.

NOZICK'S CRITIQUE. In his Anarchy, State, and Utopia (1974), Robert Nozick criticizes that the rules of justice which Rawls derives from the original position since, Nozick believes, they unfairly benefit the poor at the expense of the rich. Nozick t heoretically grants Rawls's account of the original position (most critics of Rawls will not grant even that much). His objection is that people in the original position will not have sufficient reason to put forth Rawls's second rule of justice which req uires that the rich make sacrifices for the poor. Again, Rawls maintains that the rich sacrifice something to benefit the poor, but the rich also receive a greater gain in terms of the benefit from thereby being in a society of mutual cooperation. This is sometimes called the minimax principle (a minimum loss yields a maximum gain). Nozick objects that it is not clear how much the rich gain from mutual cooperation. The rich could hold out for a principle of justice which would cost them less, although it may have a more restricted cooperative benefit. Also, it is no more outrageous to put forth an agreement which yields a higher benefit for the rich, than an agreement which yields a higher benefit for the poor. Thus, Rawls's endorsement of the difference principle is arbitrary.

Nozick also attacks Rawls for disregarding the manner in which natural assets are acquired. Again, Rawls maintains that all natural assets are arbitrary (for example, people who become rich through inheritance). Nozick, by contrast, argues that peopl e are entitled to their natural assets if they were acquired legitimately, and Rawls fails to consider this option. To make his point, Nozick uses an illustration of students who take an exam, do not know how they did, and must decide on a

procedure for a ssigning grades. Several procedures are considered. An equity principle dictates that all receive the same grade. An historical entitlement principle is also offered which bases grades on correct answers, which in turn hinges on how much a student studied . A bizarre reverse entitlement position is also offered which dictates that the highest historical entitlement scores are swapped with the lowest historical entitlement scores. Even more strange is that, in the eyes of the students, the historical entitl ement and reverse entitlement principles are on equal footing, since the students do not yet know how they did. Nozick's point is that Rawls's veil of ignorance locks one into a position where people can only consider a principle for determining wealth di stribution if it is not based on historical entitlement (how we came by it). That is, the veil of ignorance will only allow for end-result (or nonhistorical) principles of distribution, such as equality, which are not historically linked to how we came by it. The problem is that end-result (nonhistorical) explanations should be accepted only if all historical entitlement principles fail first. And Rawls presupposes that such principles are incorrect.

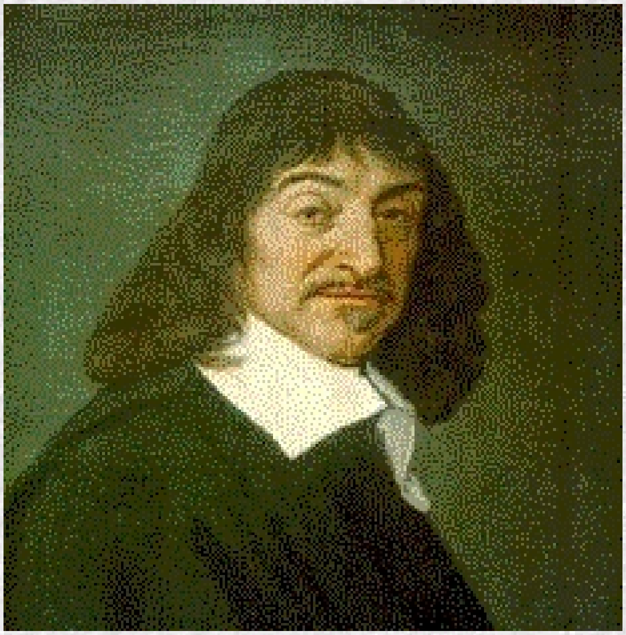
Solipsism and the Problem of Other Minds

Solipsism is sometimes expressed as the view that 'I am the only mind which exists', or 'My mental states are the only mental states'. However, the sole survivor of a nuclear holocaust might truly come to believe in either of these propositions without thereby being a solipsist. Solipsism is therefore more properly regarded as the doctrine that, in principle, 'existence' means for me *my* existence and that of *my* mental states. In other words, everything which I experience - physical objects, other people, events and processes, in short, anything which would commonly be regarded as a constituent of the spatio-temporal matrix in which I coexist with others - is necessarily construed by me as part of the content of *my* consciousness. For the solipsist, it is not merely the case that he believes that his thoughts, experiences, and emotions are, as a matter of contingent fact, the *only* thoughts, experiences, and emotions. Rather, the solipsist can attach no *meaning* to the supposition that there could be thoughts, experiences, and emotions other than his own. In short, the true solipsist understands the word 'pain', for example, to mean 'my pain' - he cannot accordingly conceive how this word is to be applied in any sense other than this exclusively egocentric one.

Section Headings:

The Importance of the Problem



It would be true to say that no great philosopher has been a solipsist. And as a theory, if indeed it can be termed such, it is clearly very far removed from common sense. In view of this, it might reasonably be asked why the problem of solipsism should receive any philosophical attention. There are two answers to this question, both of which merit clear articulation. Firstly, while it may indeed be true that no great philosopher has in fact espoused solipsism, but this can be attributed

entirely to the fact that inconsistency has been a more prevalent feature of philosophical reasoning than is commonly acknowledged, in that many philosophers have failed to accept the logical consequences of their own most fundamental commitments and preconceptions. For the foundations of solipsism lie at the heart of the view that the individual gets his own psychological concepts (thinking, willing, perceiving, etc.) from 'his own cases', i.e. by abstraction from 'inner experience'. And this view, or some variant of it, has been held by a great many, if not indeed the majority of, philosophers, since Descartes elevated the egocentric search for apodeictic certainty to the status of the primary goal of critical epistemology. In this sense, then, it is at least contestable that solipsism is implicit in many philosophies of knowledge and mind since Descartes, and that any theory of knowledge which adopts the Cartesian egocentric approach as its basic frame of reference is inherently solipsistic.

The second reason why the problem of solipsism merits close examination is that it is based upon three widely entertained philosophical *presuppositions*, which are themselves of fundamental and wide-ranging importance. These are: (a) That what I know most certainly are the contents of my own mind - my thoughts, experiences, affective states, etc.; (b) That there is no conceptual or logically necessary link between the mental and the physical, between, say, the occurrence of certain conscious experiences or mental states and the 'possession' and behavioural dispositions of a body of a particular kind; and (c) That the experiences of a given person are necessarily private to that person. These presuppositions are of unmistakable Cartesian provenance, and are, of course, very widely accepted by philosophers and non-philosophers alike. In tackling the problem of solipsism, then, one finds oneself immediately grappling with fundamental issues in the philosophy of mind - however spurious the problem of solipsism *per se* may strike one, there can be no questioning the importance of these latter issues. Indeed, one of the merits of the entire enterprise may well be the extent to which it reveals a direct connection between apparently unexceptionable and certainly widely-held common sense beliefs and the acceptance of solipsistic conclusions. If this connection does indeed exist, and we wish to avoid those solipsistic conclusions, we shall have no option but to revise, or at least to critically review, the beliefs from which they derive logical sustenance.

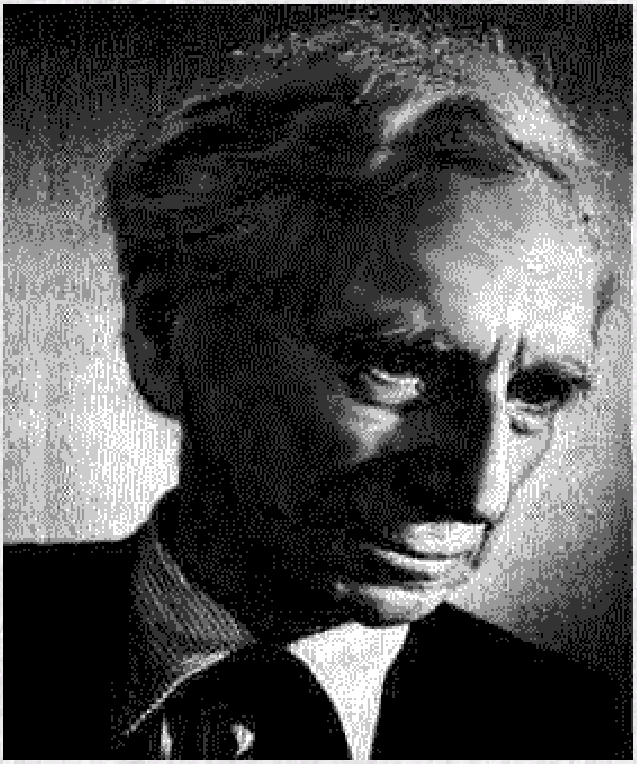
[Return to Section Headings]

Historical Origins of the Problem

René Descartes

In introducing 'methodic doubt' into philosophy, Descartes created the backdrop against which solipsism subsequently developed, and was made to seem, if not plausible, at least irrefutable. For the *ego* which is revealed by the *cogito* is, Descartes held, a solitary consciousness, a *res cogitans* which is not spatially extended, which, as such, is not necessarily located in any body, and which accordingly can be assured of its own existence exclusively *as* a conscious mind. (*Discourse on Method and the Meditations*). This view of the self is intrinsically solipsistic, and Descartes evades the solipsistic consequences of his method of doubt only by the rather desperate expedient of appealing to the benevolence of God. Since God is no deceiver, he argues, and since He has created man with an innate disposition to *assume* the existence of an external, public world corresponding to the private world of the 'ideas' which are the only immediate objects of consciousness, it follows that such a public world actually exists. (*Sixth Meditation*). Thus does God, in Descartes' philosophy, bridge the chasm between the solitary consciousness revealed by methodic doubt and the intersubjective world of public objects and other human beings. It should be clear that this particular evasion of solipsism cannot be availed of by a philosopher who at one and the same time accepts the Cartesian picture of consciousness and rejects the function attributed to God by Descartes - in view of this it is scarcely surprising that we should find the spectre of solipsism looming ever more threateningly in the works of Descartes' successors in the modern world, particularly in those of the British empiricist tradition.

Implicit in Descartes' account of the nature of mind is the view that the individual acquires such psychological concepts as he possesses 'from his own case', i.e. that each individual has a unique and privileged access to his own mind, which is denied to everyone else. Although this view utilises language and involves the employment of conceptual categories ('the individual', 'other minds', etc.) which are inimical to solipsism, it was nonetheless fundamentally conducive historically to the development of solipsistic patterns of thought. For on this view what I know immediately and with greatest certainty are the events which occur in my own mind - my thoughts, my emotions, my perceptions, my desires, etc. - and these are not known *in this way* by anyone else. By the same token, it follows that I do not know other minds in the way in which I know my own; indeed, if I



am to be said to know other minds at all - that they exist, and that they have a particular nature - it can only be on the basis of certain *inferences* which I have made from what is directly accessible to me, namely, the behaviour of other human beings.

This Cartesian view of the matter was, in its essentials, accepted by John Locke, the father of modern British empiricism. Rejecting Descartes' theory that the mind possesses ideas innately at birth, Locke argued instead that all ideas have their origins in experience. 'Reflection' (i.e. introspection or 'inner experience') is, according to Locke, the sole source of psychological concepts - without exception, he held, such concepts have their genesis in the experience of the corresponding mental processes. (*Essay Concerning Human Understanding* II.i.4ff). If this is so, if I do acquire my psychological concepts by introspecting upon my own mental operations, then it follows that I do so independently of my knowledge of my bodily states - any correlation which I make between the two will, of necessity, be effected subsequent to my acquisition of my psychological concepts. Thus it follows that this correlation cannot be a *logically necessary one.* I may discover, for example, that whenever I feel pain my body is injured in some way, but I can discover this factual correlation only after I have acquired the concept 'pain'. It cannot therefore be part of what I mean by the word 'pain' that my body should behave, or should be disposed to behave, in a particular way.

[Return to Section Headings]

The Argument from Analogy

John Stewart Mill **Bertrand Russell**

What then of my knowledge of the minds of others? On this view there can be only one answer: since what I know directly is the existence and contents of my own mind, it follows that my knowledge of the minds of others, if I am to be said to possess such knowledge at all, has to be indirect and analogical, an inference from my own case. This is the so-called 'argument from analogy' for other minds, which empiricist philosophers in particular who accept the Cartesian

account of consciousness generally assume as a mechanism for avoiding solipsism. (Cf. Mill, J.S., James, W., Russell, B., Ayer, A.J.).

Observing that the bodies of other human beings behave as my body does in similar circumstances, I can, on this view, *infer* that the mental life and series of mental events which characteristically accompany my bodily behaviour are also present in the case of others. Thus, for example, in my own case I see a problem which I am trying unsuccessfully to solve, I feel myself becoming frustrated, and I observe myself acting in a particular way. In the case of another I observe only the first and last terms of this three-term sequence, and on this basis I infer that the 'hidden' middle term, the feeling of frustration, has also occurred.

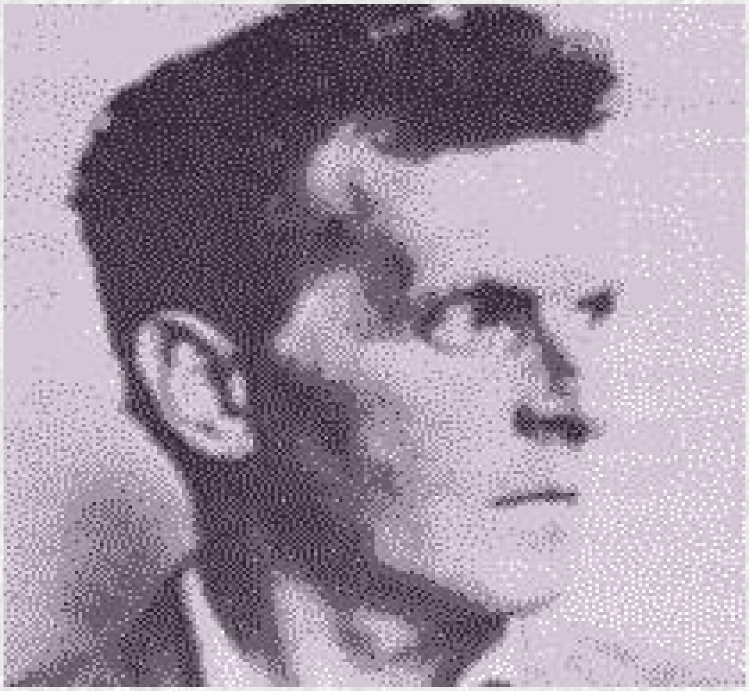
There are, however, fundamental difficulties with the argument from analogy. Firstly, if one accepts the Cartesian account of consciousness, one must, in all consistency, accept its implications. One of these implications, as we have seen above, is that there is, and can be, no logically necessary connection between the concepts of 'mind' and 'body': my mind may *in fact* be lodged in my body now, but this is a matter of sheer contingency - it need not have become located in this body, its nature will not be affected in any way by the death of this body, and there is no reason in principle why it should not in fact have been located in a body radically different from a human one, e.g. in that of a rock or a table. By exactly the same token, any correlation which exists between bodily behaviour and mental states must *also* be entirely contingent: there can be no conceptual connections between the contents of a mind at a given time and the nature and/or behaviour of the body in which it is located at that time.

This raises the question as to how my supposed analogical inferences to other minds are to take place at all: how can I apply psychological concepts to *others,* if I know *only* that they apply to myself? To take a concrete example again, if I learn what 'pain' means by reference to my own case, then of necessity I will understand 'pain' to mean 'my pain', and the supposition that pain can be ascribed to anything other than myself will be unintelligible to me.

To put the matter somewhat differently, if the relationship between having a human body, on the one hand, and having a certain kind of mental life, on the other hand, is as contingent as the Cartesian account of mind implies, then it should be equally easy - or equally difficult - for me to conceive of a table as being in pain as it is for me to conceive of another person as being in pain. The point, of course, is that this is *not* so: the supposition that a table might experience pain is a totally meaningless one, whereas the ascription of pain to other human beings, and indeed to animals which, in their physical characteristics and/or behavioural capabilities, resemble human beings, is something which even very young children find unproblematic. (Wittgenstein, L. *Philosophical Investigations,* I. § 284).

How is this to be accounted for? It will not do, *in this context,* to simply respond that a table does not have the same complex set of physical characteristics as a human body, or that it is not capable of the same patterns of behaviour as a human body - although these are undeniable truths - for the Cartesian position, again, implies that there is no *logical* connection between the mental and the physical, between the possession of a body of a particular kind, and the capability for consciousness. From this point of view, physical differentiation can and must be acknowledged, but it can play no role in any explanation of what it is to have a mental life. I am surrounded by other bodies, some of which are similar to mine, and some of which are different; on Cartesian principles

such similarities, and such differences, are *irrelevant* - the question as to whether it is legitimate for me to ascribe psychological predicates to entities other than myself, which the argument from analogy is designed to address, cannot on this view hinge on the kind of body with which I am confronted at a given time. (Malcolm, N. (a)).



The point which we come to then, in essence, is this: assuming the validity of the Cartesian position, we have to infer that it makes as much or a little sense, on these premises, to attribute any psychological predicate to another human being as it does to attribute it to a table or a rock. Which is to say that on these premises it makes no sense to attribute consciousness to another human being at all. Thus on strict Cartesian principles the argument from analogy will not do the work which is required of it in bridging the gulf between *my* conscious states and putative conscious states which are *not mine* - ultimately, it must be confessed, on these principles I know only my own mental states, and the supposition that there are mental states other than my own ceases to be intelligible to me. It is thus that solipsism comes to seem inescapable.

If the above argument is valid, it demonstrates that the acceptance of the Cartesian account of consciousness, and in particular the view that my understanding of psychological concepts derives, as do the concepts themselves, from my own case, leads inexorably to solipsism. However, it may fairly be said that the argument accomplishes more than just this: it can, and should, be understood as a *reductio ad absurdum* refutation of these Cartesian principles. Viewed from this perspective, the argument may be paraphrased as follows:

> **If there is no logical connection between the physical and the mental, if the physical forms no part of the criteria which govern my ascription of psychological predicates, then I would be able to conceive of an inanimate object such as a table as having a soul, and being conscious. But I cannot attach any intelligibility to the notion of an inanimate object being conscious. It follows therefore that there *is* a logical connection between the physical and the mental: the physical *does* form part of the criteria which govern my ascription of psychological words.**

[Return to Section Headings]

The Physical and the Mental

Ludwig Wittgenstein

What then is this logical connection between the physical and the mental? This question can best be answered by reflecting, for example, on how a cartoonist might go about showing that a particular table was angry or in pain. Now as indicated above, it is impossible to attach literal meaning to the assertion that a given inanimate object is angry or in pain, but clearly a certain imaginative latitude may be allowed for specific purposes, and a cartoonist might conceivably want to picture a table as being angry for humorous reasons.

What is significant in this connection, however, is the fact that to achieve this effect, the cartoonist must picture the table as having *human features* - the pictured table will appear angry to us only to the extent to which it possesses the natural human expression of anger; the concept of anger can find purchase in relation to the table only if it is represented as possessing something like a human form. This example demonstrates a point of quite fundamental importance: so far from being acquired by abstraction from my own case, from my own 'inner' mental life, my psychological concepts are acquired in a specifically intersubjective, social, linguistic context, and it is part of their very meaning that their primary application is to living human beings. To put this slightly differently, a person *is* a living human being, and the human person in this sense functions as our paradigm of that which has a mental life - it is precisely in relation to their application to persons that we learn such concepts as 'consciousness', 'pain', 'anger', etc. in the first instance. As such, it is a necessary and antecedent condition for the ascription of psychological predicates such as these to an object that it should 'possess' a body of a particular kind.

This point is due to Wittgenstein, who articulated it in what is now recognised as one of the centrally important methodological tenets of the *Investigations*:

> **Only of a living human being and what resembles (behaves like) a living human being can one say: it has sensations; it sees; is blind; hears; is deaf; is conscious or unconscious. (I. § 281).**

Consequently, the belief that there is something problematic about the application of psychological

words to other human beings, that such applications are necessarily the products of highly fallible inferences to the 'inner' mental lives of others, which require something like the argument from analogy for their justification, turns out to be fundamentally confused. The intersubjective world in which we live with other human beings, the public language-system which we must master if we are to think at all, these are the primary data, the 'proto-phenomena', in Wittgenstein's phrase (I. § 654) - our psychological and non-psychological concepts alike are derived from a single linguistic fountainhead. It is precisely because the living human being functions as our paradigm of that which is conscious and has a mental life that we find the solipsistic notion that other human beings could be 'automatons', machines devoid of any conscious thought or experience, bizarre and bewildering; the idea that other persons might all in reality be 'automatons' is not one which we can seriously entertain.

[Return to Section Headings]

Knowing Other Minds

We are now in a position to see the essential redundancy of the argument from analogy. Firstly, it is a misconception to think that we stand in need of this or any other inferential argument to assure us of the existence of other minds - such an assurance seems necessary only so long as it is *assumed* that each of us has to work 'outwards' from the interiority of his/her own consciousness, to abstract from our own cases, to the 'internal' world of others. As indicated above, this assumption is quite fundamentally wrong - our *knowledge* that other human beings are conscious, and our *knowledge* of their mental states at a given time, is not inferential in nature at all, but is rather determined by the public criteria which govern the application of psychological concepts. I know that a person who behaves in a particular way - who, for example, gets red in the face, shouts, gesticulates, speaks vehemently, and so forth - is angry, precisely because I have learnt the concept 'anger' by reference to such behavioural criteria. There is no inference involved here. I do not reason 'he behaves in this way, therefore he is angry' - rather 'behaving in this way' is *part of what it is to be angry,* and it does not occur to any sane person to question whether the individual who acts in this way is conscious or has a mental life. (*Investigations*, I. § 303; II. iv., p. 178).

Secondly, because the argument from analogy treats the existence of the mental lives of other living human beings as problematic, it seeks to establish that it is legitimate to infer that other living human beings do indeed have mental lives, that each one of us may be said to be justified in his confidence that he is surrounded by other persons, rather than 'automatons'. The difficulty here, however, is that the argument presupposes that I can draw an analogy between two things, myself as a person and other living human beings, which are sufficiently similar to permit the analogous comparison, and sufficiently different to require it. The question must be faced, however, as to how, or in what respects, I am either different from other human beings, or similar to them? The answer to this question, of course, is that I am *neither;* I am a living human being, as are these others. I see about me living human beings, and the argument from analogy is supposed to allow me to infer that these are persons like myself. However, the truth of the matter is that I have no criterion for discriminating living human beings from persons, for the very good reason that persons *are* living human beings - there is no conceptual difference between the two. And since the argument acknowledges that I know living human beings directly, it thereby implicitly

acknowledges that I know other persons directly, thus making itself functionally redundant. (Malcolm, N. *op. cit.*).

A final, frequently-encountered objection to the argument from analogy derives from the work of Strawson and Malcolm, and runs as follows: the argument attempts to move inferentially from my supposed direct knowledge of my own mental life and 'inner' states to my indirect knowledge of the mental states of others. It thus presupposes that I know what it means to assign mental states to myself without necessarily knowing what it means to ascribe them to others. And, it is argued, this is incoherent: to speak of certain mental states as *being mine* in the first place is to discriminate them from mental states which are *not mine,* and these, by definition, are the mental states of others. It follows, therefore, on this view, that in a fundamental sense the argument from analogy cannot get off the ground: one cannot know how to ascribe mental states to oneself unless one also knows what it means to ascribe mental states to others - which entails that the ascription of such states to others is no more problematic than their ascription to myself.

Plausible as this objection seems at first sight, it is (ironically, on Wittgensteinian criteria) quite mistaken. For it is not the case that, when I am in pain, I first identify the pain, and subsequently come to recognise that it is one which I, *as distinct from someone else,* have. The personal pronoun 'I' in the locution 'I am in pain' is not the 'I' of personal individuation - it does not refer to me, or discriminate me, as a publicly situated person as distinct from others. (*The Blue Book and Brown Books*, pp. 67-69; also *Investigations*, I. § 406). The exponent of the argument from analogy, then, is not guilty of the charge of presupposing the very thing which he is endeavouring to demonstrate, as both Strawson and Malcolm suggest. Wittgenstein in fact considered that there is a genuine asymmetry here, in relation to the ascription of psychological predicates to oneself and to others, which is dimly perceived, but misrepresented, by those who feel the need of the argument from analogy, viz. that whereas one ascribes psychological states to others by reference to bodily and behavioural criteria, one has and requires no criteria at all to self-ascribe or self-avow them. (*Investigations*, I. § 289-290).

Thus the exponent of the argument from analogy sees, quite correctly, that present-tense, first-person psychological assertions such as 'I am in pain' differ radically from third-person psychological predicate ascriptions, but thinks of the former as descriptions of 'inner' mental states to which he alone has a privileged access. And this is crucially wrong. For again, such uses of the word 'I' as occur in present-tense, first-person psychological assertions do not identify a possessor - they do not discriminate one person from amongst a group. As Wittgenstein puts it,

> **To say "I have pain" is no more a statement *about* a particular person than moaning is.(*The Blue Book and Brown Books*, p. 67; also *Investigations*, I. § 404.).**

To ascribe pain to a third party, on the other hand, is to *identify* a concrete individual as the possessor of the pain - on this point alone Wittgenstein concurs with the exponent of the argument from analogy. However, Wittgenstein here calls attention to the fact that the asymmetry is not one which exists between the supposedly direct and certain knowledge which I have of my own mental states as distinct from the wholly inferential knowledge which, allegedly, I have of the mental states of others - rather the asymmetry is, again, that the ascriptions of psychological predicates to others require criterial justificatory grounds, whereas the self-avowals or self-ascriptions of such predicates are criterionless. It thus transpires that the argument from analogy appears possible and necessary only to those who misapprehend the asymmetry between the criterial bases for

third-person psychological predicate ascription and the *non-criterial right* for their self-ascription or self-avowal for a cognitive asymmetry between direct and indirect knowledge of mental states. The Cartesian egocentric view of the mind and of mental events which gives rise both to the spectre of solipsism and attempts to evade it by means of the argument from analogy has its origins in this very misapprehension.

[Return to Section Headings]

The Privacy of Experience

What then of solipsism? To what extent does the foregoing undermine it as a coherent philosophical hypothesis, albeit one in which no-one really believes? Well, as indicated above, solipsism rests upon certain presuppositions about the mind and our knowledge of mental events and processes. Two of these, the thesis that I have a privileged form of access to, and knowledge of, my own mind, and the thesis that there is no conceptual or logically necessary link between the mental and the physical, have been dealt with above; if the foregoing is correct, both theses are false. This leaves us with the final presupposition underlying solipsism, that all experiences are necessarily (i.e. logically) private to the individual whose experiences they are. This thesis - which, it is fair to say, is very widely accepted - also derives from the Cartesian account of mind, and generates solipsistic conclusions by suggesting that experience is something which, because of its 'occult' or ephemeral nature, can never literally be shared - no two people, it suggests, can ever be said to have the *same* experience, which again introduces the problem as to how one person can know the experiences of another, or more radically, how he can know that another person has experiences at all.

Wittgenstein offers a comprehensive critique of this view too - specifically, he attacks the notion that experience is *necessarily* private. The arguments adumbrated by him against this are complex, if highly compressed and rather oracular - the following is merely an outline of their central thrust. (For more detailed accounts, cf. Kenny, A., Malcolm, N. (b), Vohra, A.).

Wittgenstein distinguishes two senses of the word 'private' as it is normally used: privacy of knowledge and privacy of possession. Something is private to me in the first sense if only I can know it; it is private to me in the second sense if only I can have it. Thus the thesis that experience is necessarily private can mean one of two things, which are not always discriminated from each other with sufficient care: (a) only I can know my experiences, or (b) only I can have my experiences. Wittgenstein argues that the first of these is false, and that the second is true in a sense which does not make experience necessarily private, as follows:

If we take pain as an experiential exemplar, we find that the assertion 'Only I can know my pains' is a conjunction of two separate theses: (i) I (can) know that I am in pain when I am in pain, and (ii) other people cannot know that I am in pain when I am in pain. Thesis (i) is, literally, a piece if nonsense: it cannot be meaningfully asserted of me that *I know* that I am in pain. Wittgenstein's point here is not that I do not know that I am in pain, when I am in pain, but rather that the word 'know' cannot be significantly employed in this way. (*Investigations*, I. § 246; II. xi. p. 222). This is because the verbal locution 'I am in pain' is usually (though not invariably) an expression of pain -

as part of acquired pain-behaviour it is a linguistic substitute for such natural expressions of pain as groaning. (I. § 244). For this reason it cannot be governed by an epistemic operator: the prepositional function 'I know that x' does not yield a meaningful proposition if the variable is replaced by an expression of pain, linguistic or otherwise. Thus to say that others learn of my pains only from my behaviour is misleading, because it suggests that I learn of them otherwise; whereas in fact I don't learn of them at all - I have them. (I. § 246).

Thesis (ii) - other people cannot know that I am in pain when I am in pain - is quite simply false: if we take the word 'know' is as it is normally used, then it is true to say that other people can and very frequently do know when I am in pain. Indeed, in cases where the pain is extreme, it is often impossible to prevent others from knowing this even when one wishes to do so. Thus, in certain circumstances, it would not be unusual to hear it remarked of someone, for example, that 'a moan of pain escaped him' - indicating that despite his efforts, he *could not but* manifest his pain to others. It thus transpires that neither thesis (i) nor (ii) is true.

If we turn to (b), we find that 'Only I can have my pains' expresses a truth, but it is a truth which is grammatical rather than ontological - it draws our attention to the grammatical connection between the personal pronoun 'I' and the possessive 'my'. However, it tells us nothing specifically about pains or other experiences, for it remains true if we replace the word 'pains' with many other plural nouns (e.g. 'Only I can have my blushes'). Another person can have the *same pain* as me: if our pains have the same phenomenal characteristics, and corresponding locations, we will quite correctly be said to have 'the same pain' - this is what the expression 'the same pain' means. Another person, however, cannot have *my* pains: *my* pains are the ones which, if they are expressed at all, are expressed by me. But by exactly the same (grammatical) token, another person cannot have my blushes, sneezes, frowns, fears, etc., and none of this can be taken as adding to our stockpile of metaphysical truths. It is true, of course, that I may deliberately and successfully keep an experience to myself, in which case that particular experience might be said to be private to me. But I might well do this by articulating it in a language which those with whom I was conversing did not understand - and there is clearly nothing occult or mysterious about this kind of privacy. (*Investigations*, II. xi, p. 222). By exactly the same token, it has to be acknowledged that an experience which I do not or cannot keep to myself is not private. In short, some experiences are private, and some are not, and from the fact that some experiences are private in this sense it does not follow that *all* experiences could be private. As Wittgenstein points out, 'What sometimes happens could always happen' is a fallacy. It does not follow from the fact that some orders are not obeyed that all orders might never be obeyed. For in that case the concept 'order' would become incapable of instantiation, and would lose its significance. (I. § 345).

[Return to Section Headings]

The Incoherence of Solipsism

With the belief in the essential privacy of experience eliminated as false, the last presupposition underlying solipsism is removed, and it can be seen that, so far from being an irrefutable, if unbelievable, philosophical thesis, solipsism is quite foundationless, in theory or in fact. Indeed, one might even say, solipsism is *necessarily* foundationless, for to make an appeal to logical rules or

empirical evidence the solipsist would implicitly have to affirm the very thing in which he purportedly refuses to believe: the reality of intersubjectively valid criteria, and of a public, extra-mental world. There is a temptation to say that solipsism is a *false* philosophical theory, but, if the foregoing is correct, this is not quite strong or accurate enough - as a theory, it is in fact incoherent. What makes it incoherent, above all else, is that the solipsist requires a language (i.e. a sign-system) to think or to affirm his solipsistic thoughts at all. Given this, it is scarcely surprising that those philosophers who accept the Cartesian premises which make solipsism apparently plausible, if not indeed, inescapable, have also invariably assumed that language-usage is itself essentially private. The cluster of arguments - generally referred to as 'the private language argument' - which we find in the *Investigations* against this assumption effectively administers the *coup de grâce* to both Cartesian dualism and solipsism. (I. § 202; 242-315). Language is an irreducibly public form of life which is encountered in specifically social contexts; each natural language-system contains an indefinitely large number of 'language-games', each governed by rules which, though conventional, are not arbitrary personal fiats; the meaning of a word is its (publicly accessible) use in a language; to question, to argue, to doubt, is, in each case, to utilise language in a particular way, it is to play a particular *kind* of public language-game. The proposition 'I am the only mind which exists' makes sense only to the extent to which it is expressed in a public language, and the existence of such language itself implies the existence of a social context. Such a context exists for the hypothetical last survivor of a nuclear holocaust, but not for the solipsist. A non-linguistic solipsism is unthinkable, and a thinkable solipsism is necessarily linguistic. Solipsism therefore presupposes the very thing which it seeks to deny: the very fact that solipsistic thoughts are thinkable in the first instance implies the existence of the public, shared, intersubjective world which they purport to call into question.

Thomas Paine (1736-1809)

LIFE. Thomas Paine was a political and deistic writer; born at Thetford, England, 1736- 1737. His parents were Quakers. He left school at thirteen and till eighteen worked at his father's trade of stay-making, when he went to sea in a privateer. In April, 1759, he settled at Sandwich as a master stay-maker, and in September of that year married. Not prospering he removed to Margate the next year and there soon after his wife died. In 1761 he entered the excise branch of the government service and remained there till 1774, with the exception of a couple of years when, probably owing to his lax conduct, he was out of the service. He was restored but again dismissed, and finally, on the charge of smuggling. In 1771 he married Elizabeth Ollive, daughter of his landlord. In 1772 he wrote a small pamphlet, *The Case of the Officers of Excise; with Remarks on the Qualifications of Officers, and on the numerous Evils arising to the Revenue, from the Insufficiency of the present Salary: humbly addressed to the Members of both Houses of Parliament*. It was the first public exhibit on of his power as a writer, but it gave offense to the upper officials and probably was the occasion of his dismissal on a trumped-up charge. Shortly after this he and his wife were formally separated.

By advice of Benjamin Franklin, whom he met in London, he came to America and at once found employment for his pen. He was a contributor to the first issue of the *Pennsylvania Magazine*, published in Philadelphia in January, 1775, and soon after its editor and so continued for eighteen months. From August, 1776, to January, 1777, he was a soldier in Washington's army, and it was while at the front that he wrote the first number of *The Crisis* which so powerfully heartened the country for the struggle. Thus introduced to the notice of the patriots he had employment as opportunity offered and was considered as a person worthy of substantial rewards. In 1777 he became secretary to the Congressional Committee of Foreign Affairs, but was obligated to resign on January 7, 1779, because in the heat of a newspaper controversy with Silas Deane he divulged state secrets. In November, 1779, he was clerk to the general assembly of Pennsylvania. In 1781, in association with Col. John Laurens he negotiated in France a loan of 6,000,000 livres. He returned on August 25. In February, 1782, he was engaged by the secretary of foreign affairs at what was then called the handsome salary of $800 per annum. In 1784 the state of New York gave him a house and 277 acres of land at New Rochelle, in 1785 Pennsylvania 500 pounds of sterling, and in October, 1785, Congress gave him $3000. The several amounts were sufficient to make him financially independent. From 1787 to 1802 he was in Europe, most of the time in France. His *Rights of Man*, published in London in 1791, attracted the attention of the French liberal party, and he was made a citizen of France and elected to the National Assembly. He had the courage to vote against the execution of Louis XVI., and thus incurred the anger of Robespierre, who threw him into the prison of the Luxembourg on December 28, 1793, and there he remained until November 4, 1794, when, on the solicitation of James Monroe, minister to France, he was released. He tells himself of his marvelous escape from the guillotine, which was solely due to the fact that his door in the prison was opened outward. It had been marked in token that the occupant of the

room was to be executed, but his door being closed for the night the mark was of course not seen by those going through the prison in the early morning to drag out their victims.

On October 30, 1802, he landed once more in America. He found that his friends had so managed his property that it would yield him an income of 400 pounds sterling. So he felt quite rich. But what cut him deeply was to find that the reputation he had made as a patriot had been almost forgotten and it was as the author of *The Age of Reason* he was known. So great was the popular execration of that book that many who would gladly have shown their appreciation of his great services to the country refused to countenance him on account of it. Hooted upon the streets, lampooned in the newspapers, deserted by his political associates, he lived a wretched existence. He was buried on his farm in New Rochelle, but his remains were removed to England in 1819 by William Cobbett. What became of them is unknown.

WRITINGS. If Paine's writings had been only political, he would have been held in honor as a bold and vigorous friend of human liberty. He was extraordinarily fertile in ideas, and broad-minded and progressive. He was in fact a great genius. His power of speech has always been admired. To him is to be traced the common saying, "These are the times that try men's souls," which is the opening sentence of the first number of *The Crisis* (which was printed in the *Pennsylvania Journal*, December 19, 1776). His pamphlet, *Common Sense* (January, 1776), was one of the memorable writings of the day, and helped the cause of Independence. His *Rights of Man; being an Answer to Mr. Burke's Attack on the French Revolution* is a complete statement of republican principles. But it is as the author of *The Age of Reason*, an uncompromising attack on the Bible, that he is most widely known, indeed notorious. The first part of this work was handed by him, while on his way to prison in the Luxembourg, to his friend Joel Barlow, and appeared, London and Paris, March 1794; the second part, composed while in prison, December, 1795; the third was left in manuscript. "His ignorance," says Leslie Stephen, "was vast, and his language brutal; but he had the gift of a true demagogue,--the power of wielding a fine vigorous English, a fit vehicle for fanatical passion." Paine was not an atheist, but a deist. In his will he speaks of his "reposing confidence in my Creator-God and in no other being; for I know no other, nor believe in any other." He voiced current doubt, and is still formidable; because, although he attacks a gross misconception of Christianity, he does it in such a manner as to turn his reader, in many cases, away from any serious consideration of the claim of Christianity. His *Age of Reason* is still circulated and read. The replies written at the time are not. Of these replies the most famous is Bishop Watson's (1796).

William Paley (1743-1805)

English theologian; born at Peterborough (37 m. n.e. of Northampton) July, 1743; died at Lincoln May 25, 1805. His mother was a keen, thrifty woman of much intelligence, and his father was a minor canon at Peterborough and a pedagogue. In 1758 Paley entered, as sizar, Christ College, Cambridge. He had been a fair scholar at his father's school, especially interested in mathematics. After taking his degree in 1763, he became usher at an academy in Greenwich and, in 1766, was elected fellow of Christ College, where he became an intimate friend of John Law and lectured successfully on metaphysics, morals, and the Greek Testament. He offered lectures on Locke, Clark's *Attributes*, and Butler's *Analogy*; and in his lectures on divinity took the ground maintained in his *Moral Philosophy* that the Thirty-nine Articles were merely articles of peace, inasmuch as they contained about 240 distinct propositions, many of them inconsistent with each other. He had been ordained a priest in 1767, and was appointed to the rectory of Musgrave in Cumberland, which be resigned in 1776, to take the vicarage of the two parishes, Appleby and Dalston. In 1780, he was installed prebendary at Carlisle, and resigned Appleby on becoming archdeacon in 1782. At the close of 1785, he became chancellor of the diocese and (1789-92) figured as an active opponent of the slave-trade. Presented to the vicarage of Aldingham in 1792, he vacated Dalston for Stanwix in 1793. In recognition of his apologetic writings, he was given the prebend of St. Pancras in St. Paul's Cathedral; the subdeanery of Lincoln, in 1795; and the rectory of Bishop Warmouth in 1795; and transferred his residence to Lincoln shortly before his death.

Paley excelled as a writer of textbooks. He is an unrivaled expositor of plain arguments, but without much originality. His moral system, in which he is said to have anticipated Bentham, is the best statement of the utilitarianism of the eighteenth century. In theology and philosophy his common-sense method, which showed his limitations of intellect, by ignoring commonly perceived difficulties and by easily accepting conclusions, has been discarded. In the former he seems to have followed a liberal construction of orthodox views, sincerely convinced that his doctrines could be logically proved by rationalistic argument. His alleged plagiarism, even as to the classical illustration of the universe by a watch, must be understood in the light of his purpose in compiling text-books. Upon being urged by Law to expand his lectures he published *The Moral and Political Philosophy* (London, 1786). His most original work was *Horce Paulince; or the Truth of the Scripture History of St. Paul evinced, by a Comparison of the Epistles which bear his name with the Acts of the Apostles and with one another* (London, 1790; subsequent editions are by J. Tate, 1840; T. R. Birks, 1850; J. S. Howson, 1877; German ed. with annotations, H. P. C. Henke, Helmstadt, 1797). His prominent apologetic works are, *A View of the Evidences of Christianity* (London, 1794) and *Natural History: or, Evidences of the Existence and Attributes of the Deity, Collected from the Appearances of Nature* (1802): the first a compendium of the arguments against the eighteenth-century deists, and the second a clear account of the a *posteriori* argument from the facts of early Christianity. The *Natural Theology*, used for many years as a foremost text-book classic, has been superseded on account of the shifting of ground from the mechanical objective to

the immanent subjective theory of the universe. Paley advances the teleological argument from design founded on the unity and adaptability of created things. This argument was based on rationalistic grounds; yet did not ultimately prove conclusive to rationalists themselves, and has not been able to survive criticism. His analogical method has run its course; the idea of a complex, perfected organism dropping suddenly amidst foreign surroundings, as illustrated by the finding of a watch, was the dogmatic externalism the rebound from which gave birth to the subsequent hypotheses of natural selection and adaptation to environment and the theory of evolution as a whole. In the *Evidences*, Paley proceeds along historical lines to affirm the truth of Christianity by two propositions; namely, that "there is clear proof that the apostles and their successors underwent the greatest hardships rather than give up the Gospel and cease to obey its precepts" and that "other miracles than those of the Gospel are not satisfactorily attested." To these he appends "auxiliary" arguments drawn from the "morality of the Gospel," "originality of Christ's character," and others. The argument is one-sided on account of its disregard of the field of Christian consciousness.

Paley also published *Reasons for Contentment; addressed to the Laboring Part of the British Public* (1793). Individual sermons which may be mentioned are: *Dangers Incidental to the Clerical Character* (1795); *Assize Sermon at Durham* (1795); as well as the compilations *Sermons on Several Subjects and Sermons and Tracts* (1808). The first collected edition of the works of William Paley appeared in 1805-08; one by A. Chalmers with biography (5 vols., London, 1819); one by E. Lynam (1825); and one by his son, E. Paley (1825).

Russell's Paradox

Russell's paradox represents either of two interrelated logical antinomies. The most commonly discussed form is a contradiction arising in the logic of sets or classes. Some classes (or sets) seem to be members of themselves, while some do not. The class of *all* classes is itself a class, and so it seems to be in itself. The null or empty class, however, must *not* be a member of itself. However, suppose that we can form a class of *all* classes (or sets) that, like the null class, are *not* included in themselves. The paradox arises from asking the question of whether *this* class is in itself. It is if and only if it is not. The other form is a contradiction involving properties. Some properties seem to apply to themselves, while others do not. The property of *being a property* is itself a property, while the propery of *being a cat* is not itself a cat. Consider the property that something has just in case it is a property (like that of *being a cat*) that does *not* apply to itself. Does this property apply to itself? Once again, from either assumption, the opposite follows. The paradox was named after Bertrand Russell, who discovered it in 1901.

History

Russell's discovery came while he was working on his *Principles of Mathematics*. Although Russell discovered the paradox independently, there is some evidence that other mathematicians and set-theorists, including Ernst Zermelo and David Hilbert, had already been aware of the first version of the contradiction prior to Russell's discovery. Russell, however, was the first to discuss the contradiction at length in his published works, the first to attempt to formulate solutions and the first to appreciate fully its importance. An entire chapter of the *Principles* was dedicated to discussing the contradiction, and an appendix was dedicated to the theory of types that Russell suggested as a solution.

Russell discovered the contradiction from considering Cantor's power class theorem: the mathematical result that the number of entities in a certain domain is always smaller than the number of subclasses of those entities. Certainly, there must be *at least* as many subclasses of

entities in the domain as there are entities in the domain given that for each entity, one subclass will be the class containing only that entity. However, Cantor proved that there also cannot be the *same* number of entities as there are subclasses. If there were the same number, there would have to be a 1-1 function *f* mapping entities in the domain on to subclasses of entities in the domain. However, this can be proven to be impossible. Some entities in the domain would be mapped by *f* on to subclasseses that contain them, whereas others may not. However, consider the subclass of entities in the domain that are not in the subclasses on to which *f* maps them. This is itself a subclass of entities of the domain, and thus, *f* would have to map it on to some particular entity in the domain. The problem is that then the question arises as to whether this entity is in the subclass on to which *f* maps it. Given the subclass in question, it does just in case it does not. The Russell paradox of classes can in effect be seen as an instance of this line of reasoning, only simplified. Are there more classes or subclasses of classes? It would seem that there would have to be more classes, since all subclasses of classes are themselves classes. But if Cantor's theorem is correct, there would have to be more subclasses. Russell considered the simple mapping of classes onto themselves, and invoked the Cantorian approach of considering the class of all those entities that are not in the classes onto which they are mapped. Given Russell's mapping, this becomes the class of all classes not in themselves.

The paradox had profound ramifications for the historical development of class or set theory. It made the notion of a universal class, a class containing all classes, extremely problematic. It also brought into considerable doubt the notion that for every specifiable condition or predicate, one can assume there to exist a class of all and only those things that satisfy that condition. The properties version of the contradiction--a natural extension of the classes or sets version--raised serious doubts about whether one can be committed to objective existence of a property or universal corresponding to every specifiable condition or predicate. Indeed, contradictions and problems were soon found in the work of those logicians, philosophers and mathematicians who made such assumptions. In 1902, Russell discovered that a version the contradiction was formulable in the logical system developed in Volume I of Gottlob Frege's *Grundgesetze der Arithmetik*, one of the central works in the late-19th and early-20th century revolution in logic. In Frege's philosophy, a class is understood as the "extension" or "value-range" of a concept. Concepts are the closest correlates to properties in Frege's metaphysics. A concept is presumed to exist for every specifiable condition or predicate. Thus, there is a concept of *being a class that does fall under its defining concept*. There is also a class defined by this concept, and it falls under its defining concept just in case it does not.

Russell wrote to Frege concerning the contradiction in June of 1902. This began one of the most interesting and discussed correspondences in intellectual history. Frege immediately recognized the disastrous consequences of the paradox. He did note, however, that the properties version of the paradox was solved in his philosophy by his distinction between levels of concepts. For him, concepts are understood a *functions* from arguments to truth-values. Some concepts, "first-level concepts", take objects as arguments, some concepts, "second-level concepts" take these functions as arguments, and so on. Thus, a concept can never take itself as argument, and the properties version cannot be formulated. However, classes, or extensions or concepts, were all understood by Frege to fall in the type of objects. The question does arise, then, for each class whether it falls under its defining concept.

When he received Russell's first letter, the second volume of Frege's *Grundgesetze* was already in

the latter stages of the publication process. Frege was forced to quickly prepare an appendix in response to the paradox. Frege considers a number of possible solutions. The conclusion he settles on, however, is to weaken the class abstraction principle in the logical system. In the original system, one could conclude that an object is in a class if and only if the object falls under the concept defining the class. In the revised system, one can conclude only that an object is in a class if and only if the object falls under the concept defining the class *and* the object is not identical to the class in question. This blocks the class version of the paradox. However, Frege was not entirely happy even with this solution. And this was for good reason. Some years later the revised system was found to lead to a more complicated form of the contradiction. Even before this result was discovered, Frege abandoned it and seems to have concluded that his earlier approach to the logic of classes was simply unworkable, and that logicians would have to make do entirely without commitment to classes or sets.

However, other logicians and mathematicians have proposed other, relatively more successful, alternative solutions. These are discussed below.

Possible Solutions to the Paradox of Properties

***The Theory of Types.* It was noted above that Frege did have an adequate response to the contradiction when formulated as a paradox of properties. Frege's response was in effect a precursor to what one of the most commonly discussed and articulated proposed solutions to this form of the paradox. This is to insist that properties fall into different types, and that the type of a property is never the same as the entities to which it applies. Thus, the question never even arises as to whether a property applies to itself. A logical language that divides entities into such a hierarchy is said to employ the *theory of types*. Though hinted at already in Frege, the theory of types was first fully explained and defended by Russell in Appendix B of the *Principles*. Russell's theory of types was more comprehensive than Frege's distinction of levels; it divided not only properties into different logical types, but classes as well. The use of the theory of types to solve the other form of Russell's paradox is described below.**

To be philosophically adequate, the adoption of the theory of types for properties requires developing an account of the nature of properties such that one would be able to explain why they cannot apply to themselves. After all, at first blush, it would seem to make sense to predicate a property of itself. The property of being self-identical would seem to be self-identical. The property of being nice seems to be nice. Similarly, it seems *false*, not *nonsensical*, to say that the property of being a cat is a cat. However, different thinkers explain the justification for the type-division in different ways. Russell even gave different explanations at different parts of his career. For his part, the justification for Frege's division of different levels of concepts derived from his theory of the *unsaturatedness* of concepts. Concepts, as functions, are essentially incomplete. They require an argument in order to yield a value. One cannot simply predicate one concept of a concept of the same type, because the argument concept still requires its own argument. For example, while it is possible to take the square root of the square root of some number, one cannot simply apply the function square root to the function square root and arrive at a value.

Conservatism about Properties. Another possible solution to the paradox of properties would involve denying that a property exists corresponding to any specifiable conditions or well-formed predicate. Of course, if one eschews metaphysical commitment to properties as objective and independent entities altogether, that is, if one adopts nominalism, then the paradoxical question is avoided entirely. However, one does not need to be quite so extreme in order to solve the antinomy. The higher-order logical systems developed by Frege and Russell contained what is called *the comprehension* principle, the principle that for every open formula, no matter how complex, there exists as entity a property or concept exemplified by all and only those things that satisfy the formula. In effect, they were committed to attributes or properties for any conceivable set of conditions or predicates, no matter how complex. However, one could instead adopt a more austere metaphysics of properties, only granting objective existence to simple properties, perhaps including *redness*, *solidity* and *goodness*, etc. One might even allow that such properties can possibly apply to themselves, e.g. that goodness is good. However, on this approach one would deny the same status to complex attributes, e.g. the so-called "properties" as *having-seventeen-heads, being-a-cheese-made-England, having-been-written-underwater,* etc. It is simply not the case that any specifiable condition corresponds to a property, understood as an independently existing entity that has properties of its own. Thus, one might deny that there is a simple property *being-a-property-that-does-not-apply-to-itself*. If so, one can avoid the paradox simply by adopting a more conservative metaphysics of properties.

Possible Solutions to the Paradox of Classes or Sets

It was mentioned above that late in his life, Frege gave up entirely on the feasibility of the logic of classes or sets. This is of course one ready solution to the antinomy in the class or set form: simply deny the existence of such entities altogether. Short of this, however, the following solutions have enjoyed the greatest popularity:

The Theory of Types for Classes: It was mentioned earlier that Russell advocated a more comprehensive theory of types than Frege's distinction of levels, one that divided not only properties or concepts into various types, but classes as well. Russell divided classes into classes of individuals, classes of classes of individuals, and so on. Classes were not taken to be individuals, and classes of classes of individuals were not taken to be classes of individuals. A class is never of the right type to have itself as member. Therefore, there is no such thing as the class of all classes that are not members of themselves, because for any class, the question of whether it is in itself is a violation of type. Once again, here the challenge is to explain the metaphysics of classes or sets in order to explain the philosophical grounds of the type-division.

Stratification: In 1937, W. V. Quine suggested an alternative solution in some ways similar to type-theory. His suggestion was rather than actually divide entities into individuals, classes of individuals, etc., such that the proposition that some class is in itself is always ill-formed or nonsensical, we can instead put certain restrictions on what classes are supposed to exist. Classes are only supposed to exist if their defining conditions are so as to not involve what would, in type

theory, be a violation of types. Thus, for Quine, while "*x* is not a member of *x*" is a meaningful assertion, we do not suppose there to exist a class of all entities *x* that satisfy this statement. In Quine's system, a class is only supposed to exist for some open formula *A* if and only if the formula *A* is *stratified*, that is, if there is some assignment of natural numbers to the variables in *A* such that for each occurrence of the class membership sign, the variable preceding the membership sign is given an assignment one lower than the variable following it. This blocks Russell's paradox, because the formula used to define the problematic class has the same variable both before and after the membership sign, obviously making it unstratified. However, it has yet to be determined whether or not the resulting system, which Quine called "New Foundations for Mathematical Logic" or NF for short, is consistent or inconsistent.

***Aussonderung*: A quite different approach is taken in Zermelo-Fraenkel (ZF) set theory. Here too, a restriction is placed on what sets are supposed to exist. Rather than taking the "top-down" approach of Russell and Frege, who originally believed that for any concept, property or condition, one can suppose there to exist a class of all those things in existence with that property or satisfying that condition, in ZF set theory, one begins from the "bottom up". One begins with individual entities, and the empty set, and puts such entities together to form sets. Thus, unlike the early systems of Russell and Frege, ZF is not committed to a universal set, a set including all entities or even all sets. ZF puts tight restrictions on what sets exist. Only those sets that are explicitly postulated to exist, or which can be put together from such sets by means of iterative processes, etc., can be concluded to exist. Then, rather than having a naive class abstraction principle that states that an entity is in a certain class if and only if it meets its defining condition, ZF has a principle of separation, selection, or as in the original German, "*Aussonderung*". Rather than supposing there to exist a set of all entities that meet some condition *simpliciter*, for each set already known to exist, *Aussonderung* tells us that there is a subset of that set of all those entities in the original set that satisfy the condition. The class abstraction principle then becomes: if set A exists, then for all entities *x* in A, *x* is in the subset of A that satisfies condition C if and only if *x* satisfies condition C. This approach solves Russell's paradox, because we cannot simply assume that there is a set of *all* sets that are not members of themselves. Given a set of sets, we can separate or divide it into those sets within it that are in themselves and those that are not, but since there is no universal set, we are not committed to the set of all such sets. Without the supposition of Russell's problematic class, the contradiction cannot be proven.**

There have been subsequent expansions or modifications made on all these solutions, such as the *ramified* type-theory of *Principia Mathematica*, Quine's later expanded system of his *Mathematical Logic*, and the later developments in set-theory made by Bernays, Gödel and von Neumann. The question of what is the *correct* solution to Russell's paradox is still a matter of debate.

Russell-Myhill Paradox

The Russell-Myhill Antinomy, also known as the *Principles of Mathematics* Appendix B Paradox, is a contradiction that arises in the logical treatment of classes and "propositions", where "propositions" are understood as mind-independent and language-independent logical objects. If propositions are treated as objectively existing objects, then they can be members of classes. But propositions can also be *about* classes, including classes of propositions. Indeed, for each class of propositions, there is a proposition stating that all propositions in that class are true. Propositions of this form are said to "assert the logical product" of their associated classes. Some such propositions are themselves in the class whose logical product they assert. For example, the proposition asserting that all-propositions-in-the-*class-of-all-propositions*-are-true is itself a proposition, and therefore it itself is in the class whose logical product it asserts. However, the proposition stating that all-propositions-in-the-*null-class*-are-true is not itself in the null class. Now consider the class *w*, consisting of all propositions that state the logical product of some class *m* in which they are *not* included. This *w* is itself a class of propositions, and so there is a proposition *r*, stating *its* logical product. The contradiction arises from asking the question of whether *r* is in the class *w*. It seems that *r* is in *w* just in case it is not. This antinomy was discovered by Bertrand Russell in 1902, a year after discovering a simpler paradox usually called "Russell's paradox". It was discussed informally in Appendix B of his 1903 *Principles of Mathematics*. In 1958, the antinomy was independently rediscovered by John Myhill, who found it to plague the "Logic of Sense and Denotation" developed by Alonzo Church.

History and Historical Importance

In his early work (prior to 1907) Russell held an ontology of propositions understood as being mind independent entities corresponding to possible states of affairs. The proposition corresponding to the English sentence "Socrates is wise" would be thought to contain both Socrates the person and wisdom (understood as a Platonic universal) as constituent entities. These entities are the meanings of declarative sentences.

After discovering "Russell's paradox" in 1901 while working on his *Principles of Mathematics*, Russell began searching for a solution. He soon came upon the Theory of Types, which he describes in Appendix B of the *Principles*. This early form of the theory of types was a version of what has later come to be known as the "simple theory of types" (as opposed to ramified type theory). The simple theory of types was successful in solving the simpler paradox. However, Russell soon asked himself whether there were other contradictions similar to Russell's paradox that the simple theory of types could not solve. In 1902, he discovered such a contradiction. Like the simpler paradox, Russell discovered this paradox by considering Cantor's power class theorem: the mathematical result that the number of classes of entities in a certain domain is always greater than the number in the domain itself. However, there seems to be a 1-1 correspondence between the number of classes of propositions and the number of propositions themselves. A different proposition can seemingly be generated for each class of propositions, for instance, the proposition stating that all propositions in the class are true. This would mean that the number of propositions is as great as the number of classes of propositions, in violation of Cantor's theorem.

Unlike Russell's paradox, this paradox cannot be blocked by the simple theory of types. The simple theory of types divides entities into individuals, properties of individuals, properties of properties of individuals, and so forth. The question of whether a certain property applies to itself does not arise, because properties never apply to entities of their own type. Thus there is no question as to whether the property that a property has just in case it does not apply to itself applies to itself. Classes can only have entities of a certain type: the type to which the property defining the class applies. There can be classes of individuals, classes of classes of individuals, and classes of classes of classes of individuals, etc., but never classes that contain members of different types. Thus, there is no such thing as the class of all classes that are not in themselves. However, on the simple theory of types, propositions are not properties of anything, and thus, they are all in the type of individuals. However, they can include classes or properties as constituents. But consider the property a proposition has just in case it states the logical product of a class it is not in. This property defines a class. This class will be a class of individuals; for any individual, the question arises whether that individual is in the class. However, the proposition stating the logical product of this class is also an individual. Thus, the problematic question is not avoided by the simple theory of types.

Some authors have speculated that this antinomy was the first hint Russell found that what was needed to solve the paradoxes was something more than the simple theory of types. If so, then this antinomy is of considerable importance, as it might represent the first motivation for the ramified theory of types adopted by Russell and Whitehead in *Principia Mathematica*.

Formulation and Derivation

In 1902, when he discovered this paradox, Russell's logical notation was borrowed mostly from Peano. In this symbolism, the class *w* of all propositions stating the logical product of a class they are not in, and *r*, the proposition stating its logical product, are written as follows:

$$w = p \ni [\exists m \ni \{p \;.{=}{:}\; q \,\varepsilon\, m \;.{\supset_q}.\; q \;{:}.\; p \sim\!\varepsilon\, m\}]$$
$$r = (q \,\varepsilon\, w \;.{\supset_q}.\; q)$$

In somewhat more contemporary notation, these become:

$$w = \{p: (\exists m)[(p = (\forall q)(q \in m \supset q)) \;\&\; (p \notin m)]\}$$
$$r = (\forall q)(q \in w \supset q)$$

Because propositions are entities, variables for them in Russell's logic can be bound by quantifiers and can flank the identity sign. Indeed, Russell also allows complete sentences or formulae to flank the identity sign. If α is some complex formula, then "$p = \alpha$" is to be understood as asserting that *p* is *the proposition that* "α". Thus, *w* is defined as the class of propositions *p* such that there is a class of *m* for which *p* is the proposition that all propositions *q* in *m* are true, and such that *p* is not in *m*. The proposition *r* is then defined as the proposition stating that all propositions in *w* are true.

The derivation of the contradiction requires certain principles involving the identity conditions of propositions understood as entities. These principles were never explicitly formulated by Russell, but are informally stated in his discussion of the antinomy in the *Principles*. However, other writers have sought to make these principles explicit, and even to develop a fully formulated intensional logic of propositions based on Russell's views. The principles relevant for the derivation of the contradiction are the following:

Principle 1: $(\forall p)(\forall q)(\forall r)(\forall s)[((p \supset q) = (r \supset s)) \supset ((p = r) \;\&\; (q = s))]$
Principle 2: $[(\forall x)A(x) = (\forall x)B(x)] \supset (\forall y)[A(y) = B(y)]$

The first principle states that identical conditional propositions have identical antecedent and consequent component propositions. The second states that if the universal proposition that everything satisfies open formula A(*x*) is the same as the universal proposition that everything satisfies open formula B(*x*), then for any particular entity *y*, the proposition that A(*y*) is identical to the proposition that B(*y*).

Then, from either the assumption that $r \in w$ or the assumption $r \notin w$, the opposite follows.
Assume:
1. $r \in w$
From (1), by class abstraction and the definition of *w*:
2. $(\exists m)[(r = (\forall q)(q \in m \supset q)) \;\&\; (r \notin m)]$
(2) allows us to consider some *m* such that:
3. $(r = (\forall q)(q \in m \supset q)) \;\&\; (r \notin m)$
From the first conjunct of (3) definition of *r* we arrive at:
4. $(\forall q)(q \in w \supset q) = (\forall q)(q \in m \supset q)$

By (4) and principle 2, then:

5. $(\forall q)[(q \in w \supset q) = (q \in m \supset q)]$

Instantiating (5) to *r*, we conclude:

6. $(r \in w \supset r) = (r \in m \supset r)$

By (6), and principle 1, then:

7. $(r \in w) = (r \in m)$

The definition of $\notin$ and second disjunct of (3) yield:

8. $\sim(r \in m)$

By (7) and (8) and substitution of identicals, we get:

9. $\sim(r \in w)$

By (9) and the definition of $\notin$:

10. $r \notin w$

This contradicts our assumption. However, assume instead:

11. $r \notin w$

By (11) and class abstraction:

12. $\sim(\exists m)[(r = (\forall q)(q \in m \supset q)) \ \& \ (r \notin m)]$

By the rules of the quantifiers and propositional logic, (12) becomes:

13. $(\forall m)[(r = (\forall q)(q \in m \supset q)) \supset (r \in m)]$

Instantiating (13) to *w*:

14. $(r = (\forall q)(q \in w \supset q)) \supset (r \in w)$

By (14), the definition of *r*, and modus ponens:

15. $r \in w$

Thus, from either assumption the opposite follows.

Frege's Response

Soon after discovering this antinomy, in September of 1902, Russell related his discovery to Gottlob Frege. Although Frege was clearly devastated by the simpler "Russell's paradox", which Russell had related to Frege three months prior, Frege was not similarly impressed by the Russell-Myhill antinomy. Russell had formulated the antinomy in Peano's logical notation, and Frege charged that the apparent paradox derived from defects of Peano's symbolism.

In Frege's own way of speaking, a "proposition" is understood simply as a declarative sentence, a bit of language. Frege certainly did not ascribe to propositions the sort of ontology Russell did. However, he thought propositions had both senses and references (see sense/reference distinction). He called the senses of propositions "thoughts" and believed that their references were truth-values, either the True or the False. An expression written in his logical language was thought to stand for its reference (though express a thought). When propositions flank the identity sign, e.g. "$p = q$" this is taken as expressing that the two propositions have the same truth-value, not that they express the same thought.

Thus, Frege was unsatisfied with Russell's formulation of the antinomy. In Russell's definition "$w = \{p: (\exists m)[(p = (\forall q)(q \in m \supset q)) \ \& \ (p \notin m)]\}$", the part "$p = (\forall q)(q \in m \supset q)$" seems to mean not

an identity of truth-values, but thoughts. However, if this is the case, then "$(\forall q)(q \in m \supset q)$" must be understood as referring to, rather than simply expressing, a thought. However, on Frege's view, this would mean that the expressions that occur in it have indirect reference, i.e. they refer to the thoughts they customarily express. However, in indirect reference, the variable "m" in that context must be understood not as standing for a class, but as standing for a sense picking out a class. However, the second occurrence of "m" later on in the definition of w must be understood as referring to a class, not a sense picking out a class. However, if the two occurrences of "m" do not refer to the same thing, it is extremely problematic that they be bound by the same quantifier. Moreover, Russell's derivation of the contradiction requires treating the two occurrences of "m" as referring to the same thing. Thus, Frege himself concluded that the antinomy was due to unclarities in the symbolism Russell used to formulate the paradox. He suggests that the antinomy can only be derived in a system that conflates or assimilates sense and reference.

However, it is not clear that Frege's response is adequate. Frege criticizes only the syntactic formulation of the antinomy in a logical language, not the violation of Cantor's theorem lying behind the paradox. Frege does not have an ontology of propositions, but he does have an ontology of thoughts. Thoughts, as objectively existing entities, can be members of classes. Moreover, it seems that there will be as many thoughts as there are classes of thoughts. One can generate a different thought for every class, i.e. the thought that everything is in the class or that all thoughts in the class are true. We now consider the class of all thoughts that state the logical product of a class they are not in, and a thought stating the logical product of this class, and arrive at the same contradiction. Frege's metaphysics seems to have similar difficulties.

It is true that the antinomy cannot be formulated in Frege's own logical systems. However, this is only because those systems are entirely extensional. In them, it is impossible to *refer* to thoughts (as opposed to simply express them) and assert their identity--one can only refer to truth-values and assert their identity. However, it appears that if Frege's logical systems were expanded to include commitment to the realm of sense, to make it possible to refer not only to truth-values and classes, but thoughts and other senses, a version of the antinomy would be provable. In 1951, Alonzo Church developed an expanded logical system based loosely on Frege's views, which he called "the Logic of Sense and Denotation". In 1958, John Myhill discovered that the antinomy considered here was formulable in Church's system. Myhill seems to have rediscovered the paradox independently of Russell. Hence the term, "Russell-Myhill Antinomy."

Possible Solutions

The antinomy results from the following commitments

> (A) The commitment to classes, defined for every property,
>
> (B) The commitment to propositions as intensional entities (or to similar entities, such as Frege's thoughts),
>
> (C) An understanding of propositions such that there must exist as many propositions as there are classes of propositions; i.e. a *different* proposition can be generated for

every class,

(D) An understanding of propositions and classes such that for every proposition and every class of propositions, the question arises as to whether the proposition falls in the class.

One might hope to solve the antinomy by abandoning any one of these commitments. Let us examine them in turn.

Abandoning (A), the commitment to classes, is very tempting, especially given the other paradoxes of class theory. However, in this context, this option may be not be as fruitful as it might appear. Russell himself worked on a "no classes" theory from 1905 though 1907. However, he soon discovered a classless version of the same paradox. Here, rather than considering a class *w* consisting of propositions, we consider a property *W* that a proposition *p* has just in case there is some property *F* for which *p* states that all propositions with *F* are true but which *p* does not itself have. Thus:

$$(\forall p)[Wp \equiv (\exists F)[(p = (\forall q)(Fq \supset q)) \;\&\; {\sim}Fp]]$$

We then define proposition *r* as the proposition that all propositions with property *W* are true:

$$r = (\forall q)(Wq \supset q)$$

Then, via a similar deduction to that given above, from the assumption of *Wr* one can prove ~*Wr* and vice versa. Thus it does not do to simply abandon classes. One would also have to abandon a robust ontology of properties; perhaps eschewing all of higher-order logic.

One might simply want to abandon (B), the commitment to propositions or Fregean thoughts understood as logical entities. The commitment to logical entities in a Platonic realm has grown less and less popular, especially given the widespread view that logic ought to be without ontological commitment. The challenge would be to abandon such intensional entities while maintaining a plausible account of meaning and intentionality.

However, one might hope to maintain commitment to propositions or thoughts, but attempt to reduce the number posited. This would likely involve denying (C). The Cantorian construction lying at the heart of the antinomy involves the claim that one can generate a *different* proposition for every class. In the construction given above, this claim is justified by showing that for each class, one can generate a proposition stating its logical product, and showing that, for each class, the class so generated is *different*. To deny this, one could either deny that one can generate such a proposition for each class, or instead, deny that the proposition so generated is *different* for every class. The first strategy is difficult to justify if one understands propositions and classes as objectively existing entities, independent of mind and language. If a proposition exists for every possible state of affairs, then one such proposition will exist for every class.

However, if one adopts looser identity conditions for propositions or thoughts, one might attempt to take the second approach to denying (C). That is, one would allow that the proposition stating the logical product of one class might be the same proposition as the proposition stating the logical product of a *different* class. This is perhaps not an easy approach to justify. In the Russellian deduction given above, principles 1 and 2 guarantee that the proposition stating the logical product

of one class is always different from the proposition stating the logical product of another class. These principles seem justified by the understanding of propositions as composite entities with a certain fixed structure. Consider principle 1. It states that identical conditional propositions have identical propositions in their antecedent and consequent positions. However, this might be denied if one were adopt looser identity conditions for propositions. One might, for example, adopt *logical equivalence* as being a sufficient condition for propositions to be identical. If so, then principle 1 would be unjustified. For example $p \supset q$ and $\sim q \supset \sim p$ are logically equivalent, however, they obviously need not have the same antecedent propositions. However, this approach may lead to other difficulties. Often, part of the motivation for intensional entities such as propositions or Fregean thoughts is in order to view them as relata in belief and other intentional states. If one adopts logical equivalence as sufficient for propositions to be identical, this is extremely problematic. The simple proposition p is logically equivalent to the proposition $\sim(p \,\&\, \sim q) \supset \sim(q \supset \sim p)$. If we take these two be the same proposition, then if propositions are relata in belief states, we seemingly must conclude that anyone who believes p also believes $\sim(p \,\&\, \sim q) \supset \sim(q \supset \sim p)$. This does not seem to be true.

W. V. Quine is famous for suggesting that intensional entities are "creatures of darkness", having obscure identity conditions. Here it appears that if the identity conditions of intensions are taken to be too loose, then intensions cannot do many of the things we want of them. If the identity conditions of intensions are too stringent, however, it is difficult to avoid positing so many of them that inconsistency with Cantor's theorem is a genuine threat.

Lastly, one could maintain commitment to a great number of propositions or thoughts as entities, but block the paradox by suggesting that these entities fall into different logical types. That is, one could deny (D), and suggest instead that the question does not always arise for every proposition and class of propositions whether that proposition is in that class. This is in effect the approach taken with ramified type-theory. In ramified type theory, the type of a formula α depends not only on whether α stands for an individual, a property of an individual, or a property of a property of an individual, etc., but also on what sort of quantification α involves. The core notion is that α cannot involve quantification over, or classes including, entities within a domain that includes the thing that α itself stands for. Consider the proposition r from the antinomy. Recall that r was defined as $(\forall q)(q \in m \supset q)$. Thus, r involves quantification over propositions. In ramified type theory, we would disallow r to fall within the range of the quantifier involved in the definition of r. If a certain proposition involves quantification over a range of propositions, it cannot be included in that range. Thus, we divide the type of propositions into *orders*. Propositions of the lowest order include mundane propositions such as the proposition that Socrates is bald or the proposition that Hypatia is wise. Propositions of the next highest order involve quantification over, or classes of, propositions of this order, such as the proposition that all such propositions are true, or the proposition that if such a proposition is true, then God believes it, etc. Here, the challenge is to justify the ramified hierarchy as something more than a simple *ad hoc* dodge of the antinomies, to provide it with solid philosophical foundations. Poincaré's Vicious Circle Principle is perhaps one way of providing such justification.

Antinomies such as the Russell-Myhill antinomy must be a concern for anyone with a robust ontology of intensional entities. Nevertheless, there may be solutions to the antinomy short of eschewing intensions altogether.

Parmenides (b. 510 BCE.)

Parmenides was a Greek philosopher and poet, born of an illustrious family about BCE. 510, at Elea in Lower Italy, and is is the chief representative of the Eleatic philosophy. He was held in high esteem by his fellow-citizens for his excellent legislation, to which they ascribed the prosperity and wealth of the town. He was also admired for his exemplary life. A "Parmenidean life" was proverbial among the Greeks. He is commonly represented as a disciple of Xenophanes. Parmenides wrote after Heraclitus, and in conscious opposition to him, given the evident allusion to Hericlitus: "for whom it is and is not, the same and not the same, and all things travel in opposite directions" (fr. 6, 8). Little more is known of his biography than that he stopped at Athens on a journey in his sixty-fifth year, and there became acquainted with the youthful Socrates. That must have been in the middle of the fifth century BCE., or shortly after it.

Parmenides broke with the older Ionic prose tradition by writing in hexameter verse. His didactic poem, called *On Nature*, survives in fragments, although the Proem (or introductory discourse) of the work has been preserved. Parmenides was a young man when he wrote it, for the goddess who reveals the truth to him addresses him as 'youth'. The work is considered inartistic. Its Hesiodic style was appropriate for the cosmogony he describes in the second part, but is unsuited to the arid dialectic of the first. Parmenides was no born poet, and we much ask what led him to take this new departure. The example of Xenophanes' poetic writings is not a complete explanation; for the poetry of Parmenides is as unlike that of Xenophanes as it well can be, and his style is more like Hesiod and the Orphics. In the Proem Parmenides describes his ascent to the home of the goddess who is supposed to speak the remainder of the verses; this is a reflexion of the conventional ascents into heaven which were almost as common as descents into hell in the apocalyptic literature of those days.

The Proem opens with Parmenides representing himself as borne on a chariot and attended by the Sunmaidens who have quitted the Halls of Night to guide him on his journey. They pass along the highway till they come to the Gate of Night and Day, which is locked and barred. The key is in the keeping of Dike (Right), the Avenger, who is persuaded to unlock it by the Sunmaidens. They pass in through the gate and are now, of course, in the realms of Day. The goal of the journey is the palace of a goddess who welcomes Parmenides and instructs him in the two ways, that of Truth and the deceptive way of Belief, in which is no truth at all. All this is described without inspiration and in a purely conventional manner, so it must be interpreted by the canons of the apocalyptic style. It is clearly meant to indicate that Parmenides had been converted, that he had passed from error (night) to truth (day), and the Two Ways must represent his former error and the truth which is now revealed to him.

There is reason to believe that the Way of Belief is an account of Pythagorean cosmology. In any case, it is surely impossible to regard it as anything else than a description of some error. The goddess says so in words that cannot be explained away. Further, this erroneous belief is not the

ordinary man's view of the world, but an elaborate system, which seems to be a natural development the Ionian cosmology on certain lines, and there is no other system but the Pythagorean that fulfils this requirement. To this it has been objected that Parmenides would not have taken the trouble to expound in detail a system he had altogether rejected, but that is to mistake the character of the apocalyptic convention. It is not Parmenides, but the goddess, that expounds the system, and it is for this reason that the beliefs described are said to be those of 'mortals'. Now a description of the ascent of the soul would be quite incomplete without a picture of the region from which it had escaped. The goddess must reveal the two ways at the parting of which Parmenides stands, and bid him choose the better. The rise of mathematics in the Pythagorean school had revealed for the first time the power of thought. To the mathematician of all men it is the same thing that can be thought and that can be, and this is the principle from which Parmenides starts. It is impossible to think what is not, and it is impossible for what cannot be thought to be. The great question, Is it or is it not? is therefore equivalent to the question, Can it be thought or not?

In any case, the work thus has two divisions. The first discusses the truth, and the second the world of illusion -- that is, the world of the senses and the erroneous opinions of mankind founded upon them. In his opinion truth lies in the perception that existence is, and error in the idea that non-existence also can be. Nothing can have real existence but what is conceivable; therefore to be imagined and to be able to exist are the same thing, and there is no development. The essence of what is conceivable is incapable of development, imperishable, immutable, unbounded, and indivisible. What is various and mutable, all development, is a delusive phantom. Perception is thought directed to the pure essence of being; the phenomenal world is a delusion, and the opinions formed concerning it can only be improbable.

Parmenides goes on to consider in the light of this principle the consequences of saying that anything is. In the first place, it cannot have come into being. If it had, it must have arisen from nothing or from something. It cannot have arisen from nothing; for there is no nothing. It cannot have arisen from something; for here is nothing else than what is. Nor can anything else besides itself come into being; for there can be no empty space in which it could do so. Is it or is it not? If it is, then it is now, all at once. In this way Parmenides refutes all accounts of the origin of the world. Ex nihilo nihil fit.

Further, if it is, it simply is, and it cannot be more or less. There is, therefore, as much of it in one place as in another. (That makes rarefaction and condensation impossible.) it is continuous and indivisible; for there is nothing but itself which could prevent its parts being in contact with on another. It is therefore full, a continuous indivisible plenum. (That is directed against the Pythagorean theory of a discontinuous reality.) Further, it is immovable. If it moved, it must move into empty space, and empty space is nothing, and there is no nothing. Also it is finite and spherical; for it cannot be in one direction any more than in another, and the sphere is the only figure of which this can be said. What is is, therefore a finite, spherical, motionless, continuous plenum, and there is nothing beyond it. Coming into being and ceasing to be are mere 'names', and so is motion, and still more color and the like. They are not even thoughts; for a thought must be a thought of something that is, and none of these can be.

Such is the conclusion to which the view of the real as a single body inevitably leads, and there is no escape from it. The 'matter' of our physical text-books is just the real of Parmenides; and, unless we can find room for something else than matter, we are shut up into his account of reality. No subsequent system could afford to ignore this, but of course it was impossible to acquiesce

permanently in a doctrine like that of Parmenides. It deprives the world we know of all claim to existence, and reduces it to something which is hardly even an illusion. If we are to give an intelligible account of the world, we must certainly introduce motion again somehow. That can never be taken for granted any more, as it was by the early cosmologists; we must attempt to explain it if we are to escape from the conclusions of Parmenides.

Perception

In philosophy, "perception" is defined as the complex method of obtaining information about our surrounding world, specifically through our senses, and apprehending this information as beliefs. The main philosophical problem with this notion of perception is that we should not accept our perceptions as being reliable, since (1) it is possible for us to misperceive objects in the world, (2) our senses are susceptible to illusions (e.g. hallucinations), and (3) it is unclear how much epistemological value perceptions have, or how much belief, if any, should be rooted in that which we perceive.

Several answers to these problems have been proposed including the common-sense theory, the representative theory of perception, sense-datum theory, and phenomenalism. The common-sense or direct realist theory maintains that the world is as it is perceived, which assumes that there is a world with objects that exists independently of human perceptions. Direct realism not only denies that our experiences are subjective, but also denies that are perceptions are reduced to mere sense-data. It also avoids simplifying the perceptual experience into an act (awareness of) and an object.

The representative, or causal, theory of perception maintains that sense-data come to us from objects in the world around us, although we never have direct awareness of the objects in the world. Locke subscribed to this theory and can be seen particularly in his account of the mind as a blank slate. If the mind is considered to be a blank tablet upon which experience writes, then the writings can be assumed to be reliable inferences as to the nature of the world insofar as they are caused by objects in the world. For Locke, our perceptions of the world come to us pre-organized, and do not require cognitive structuring on the part of the perceiver.

The sense-data theory claims that we perceive something called "sense-data" in place of the actual objects that are in the world around us. This concept was first introduced by Moore, and was later adopted by Russell and Broad. This theory has come under scrutiny from Ryle and Austin, who propose that the notion of "sense- data" only complicates our account of perceptions. We do not perceive discrete bits of information, but instead perceive objects in our surrounding world.

Peripatetics

"Peripatetic" is the name given to followers of Aristotle. The term means "to walk about." According the common account, the sect was called this from the fact that Aristotle *walked about* as he discoursed with his students. An alternative account is that the name derives from the public walk in the Lyceum which Aristotle and his disciples frequently took. Before leaving Athens, under fear of prosecution for impiety, Aristotle appointed Theophrastus as his successor. After him, the uninterrupted successors were Strato of Lampsacus, Lycon or Glycon of Troas, Ariston of Ceos, Critolaus the Lycian, and Diodorus of Tyre. The chain terminated in the 140 Olympiad.

The Peripatetic doctrines were introduced into Rome along with other Greek philosophies by the embassy of Critolaus, Carneades, and Diogenes, but were little known until the tie of Sylla. Tyrannion the grammarian and Andronicus of Rhodes were the first who brought the writings of Aristotle and Theophrastus into notice. The obscurity of Aristotle's works hindered the success of his philosophy among the Romans. Julius Caesar and Augustus patronized the Peripatetic doctrines. Under Tiberius, Caligula, and Claudius, however, the Peripatetics along with other philosophical schools, were either banished or obliged to remain silent on their views. This was also the case during the greater part of the reign of Nero, although, in the early part of it philosophy was favored. Ammonius the Peripatetic made great efforts to extend the authority of Aristotle, but about this time the Platonists began to study his writings, and prepared the way for the Eclectic Peripatetics under Ammonius Sacas, who flourished about a century after Ammonius the Peripatetic. After the time of Justinian, philosophy in general declined. But in the writings of the scholastics, Aristotle's views predominated. About the 12th century it had many adherents among the Saracens and Jews, particularly in Spain.

Moral Personhood

The problem of moral personhood focuses on determining which beings are members of what we might call the moral community. The moral community consists of all those beings who have moral duties, rights, or, in general, deserve moral consideration. Medieval theologians speculated about whether angels were members of the moral community and thereby had the same moral duties as humans. Science fiction fans speculate about whether aliens from other worlds would have fundamental rights. Animal rights advocates contend that at least some animals have the same moral status as humans. Medical ethicists struggle to determine whether permanently comatose humans have any rights. The issue in all of these cases involves what it takes to be a morally significant person. The term "person" in this sense is not necessarily restricted to human beings. A morally significant person is any being who is a member of the moral community. Several criteria of moral personhood have been suggested. Members of the Jain religion from India believe that all living animals -- even insects -- qualify as persons and thus have a right to life. Jains frequently wear cloths over their mouths to avoid accidentally inhaling bugs, and they sweep paths before themselves to keep from stepping on insects.

Few people in our part of the world agree with the Jain criterion of personhood. A less extreme criterion of personhood is that of consciousness. A conscious being is one which has sensory experiences and is aware of those experiences. The notion of sentience -- the ability to experience pleasure and pain -- is often associated with consciousness. If consciousness or sentience were the criteria of personhood, then insects would most likely not qualify as persons. But even the criterion of consciousness is too inclusive since lower animals such as lizards and chickens are conscious and would thus qualify as morally significant persons. A more narrow criterion of personhood which is widely adopted by contemporary ethicists is the notion of self-awareness, or the ability to conceive of oneself as existing in time. A self-aware being understands that it has a past history, and that the events of its history are relevant to who it is now. It is unlikely that lizards and chickens are self-aware, and thus would not be members of the moral community. However, higher mammals such as dogs and chimpanzees are self-aware so, according to this criterion, they would be entitled to the same moral standing as humans. Although self-awareness is a less inclusive criterion than that of consciousness, many people still believe that granting rights to dogs and chimpanzees is going too far. Thus, even the criterion of self-awareness is not strict enough.

Perhaps the most restrictive criterion of personhood which has been suggested is rationality, particularly the kind of rationality that on this planet is exhibited only by humans. Features of rationality commonly include the ability to develop a complex language, to make complex tools, and to understand the world around us. Critics have attacked this definition, though, since it gives an arbitrary preference for human rationality. Studies of chimpanzees and dolphins show that many higher animals do indeed communicate in complicated ways, can make tools for manipulating the environment, and have an understanding of the world. These abilities are not exactly like human abilities, but are nevertheless complex enough to be called "rational."

The precise criterion of personhood is an ongoing dispute. But regardless of which criterion is adopted, if a being qualifies as a person, then it has a direct moral standing. That is, that being is a rights-holder, and others have a direct duty toward that person. Beings which do not qualify as persons might be entitled to an indirect moral standing, that is, a moral consideration derived only from the interests of genuine persons. For example, even if a chicken does not qualify as a person, we might have an indirect duty to not torture that chicken because doing so may greatly offend persons. Similarly, although dead human beings are no longer morally significant persons, we have an indirect duty to treat the corpses of the dead with respect. If we treated the corpses disrespectfully, such as throwing the bodies out with the morning garbage, this would cause psychological harm to the living relatives. It is important to note that the issue of personhood is central not only to the moral status of animals, but also for the moral status human fetuses, infants, the mentally retarded, and the comatose.

Phenomenon

In its most general philosophical sense, a phenomenon (pl. phenomena) involves any object in the world around us that we perceive through our senses. A phenomenon is that perception of an object which becomes visible to our consciousness.

Plato held that phenomena were in opposition to a thing's essence, and were weak and fragile forms of reality. For Kant, phenomena are in opposition to the thing-in-itself, or the noumenon; they are the objects or events that are interpreted through the categories. Modern positivists follow Kant and hold that phenomena are objects or events in time and space, and therefore are capable of being described and observed. The positivists hold that we have no knowledge of anything but phenomena, and that their knowledge of phenomena is relative.

The concept of "phenomenon" has become the basis for two schools of thought and study, *phenomenalism* and *phenomenology*. *Phenomenalism* is the position that arises out of the difficulties present in the dualism between the phenomenon and the object. It maintains that all we know are phenomena; we know nothing of the external things causing the phenomena. Berkeley was the first to examine the problem of accessing the external world and to arrive at the first phenomenalistic system. J.S. Mill gives a phenomenalist account of the external world by viewing material objects in terms of their possible sensations. Other phenomenalists are Renouvier, Mach, Carnap, and Ayer. *Phenomenology* is the description and study of appearances. The term has come to be closely associated with the method of inquiry that was originated by Brentano and further developed by Husserl. The movement originally placed an emphasis on human experience descriptions, as the human experience was directed onto objects. Husserl shifted the emphasis toward a description of the objects of experience, which were called phenomena. Like phenomenalism, phenomenology recognizes the problem of accessing the external world behind our perceptions. We, thus, "bracket" or postpone discussion of the external world and focus only on phenomena.

The Internet Encyclopedia of Philosophy

Plotinus (204-270 CE.)

LIFE. Plotinus was born at Lycopolis, in Upper Egypt in 204 CE, and died at Campania in 270 CE. In the twenty-eighth year of his life he applied himself to philosophy, and attended the lectures of the most celebrated men of that time in Alexandria. After studying under Ammonius for some ten years, he accompanied the Emperor Gordian in his campaign against the Persians, in order to learn something of their philosophy. In this object he failed, owing to the unsuccessful issue of the undertaking; he was even obliged to flee for his life to Antioch. In 244 he went to Rome and won numerous adherents to his teaching, among them the Emperor Gallienus and his wife Salonina. He conceive the idea of founding an ideal city in Campania, with the approval and support of the emperor: this city was to be called Platonopolis, and its inhabitants were to live according to the laws of Plato. Gallienus was not disinclined to enter into the plan; but it was thwarted by the opposition of the imperial counselors. He taught in Rome until about 268, retiring then to the country estate of a disciple in Campania. Plotinus did not reduce his doctrine to writing until toward the close of his life, and then did not publish it. His pupil Porphyry, arranged the fifty-four treatises of Plotinus in six Enneades, placing them in logical order from the simplest to the most abstruse, as well as chronological sequence. They were first printed in a Latin translation by Marsilio Ficino at Florence in 1492, then in Greek and Latin at Basel, in 1580.

THE ONE. What principally distinguishes Plotinus from both Plato and his immediate predecessors is the assumption of a principle higher than the *nous*. This assumption proceeds from the requirement of unity as an attribute of the highest principle; the *nous*, as at once subject and object of perception, *nooun* and *nooumenon* is twofold. Therefore something higher must be sought, which is absolute unity, the One, identical with the Godhead and wholly transcendent-the first cause, the source of all thinking and being, all the good and beautiful, and all activity. The utter transcendence of God being was taught by Plotinus in a more extreme form than by any of his predecessors. He admits the insolubility by human reason of the most difficult of all metaphysical problems i.e. (how becoming arose out of immutable being and plurality out of unity). The theory of Emanation, which he accepts, also cannot answer the question. Following Plato, he suggests that the explanation may be found in the goodness or benevolence of God. All other beings produce yet others; and how should the most perfect of all beings, the primal goodness and the highest power, remain absorbed in itself as though impotent to produce? This, of course, is rather an anthropomorphic-ethical than a metaphysical explanation. His attempt to supply the metaphysical explanation is found in the view that the highest being is over-full, and, as the higher, does not precisely contain the lower in itself but allows it to flow forth from its superabundant perfection. This doctrine may possibly show oriental influence; but the idea of emanation occurs in the Stoic teaching, and still more in Philo, though in neither so fully developed as with Plotinus.

NOUS, THE WORLD SOUL. That which first issues from the One is the *nous*, which is conscious of being a product and image of the One and receives from its relation to the One its power to

produce other existences. It is not mere thought but actual being, comprehending all things as the genus comprehends the species. Plato conceived of actual being as being contained in one idea, that of good. Plotinus conceived of it as containing the ideas. Another difference is that whereas Plato asserted the existence of ideas only for such objects as had a common concept or name, Plotinus attributes them to all single existences. From the *nous* proceeds further the soul, the third principle. As the highest principle has neither thought nor consciousness, so the *nous*, which is purely contemplative, has no reflective, logical thought. This is the work of the world-soul, which is the link between the intelligible and the phenomenal world, carrying on the process of emanation down to its lowest terms. Matter is conceived by Plotinus not exactly as an emanation from the world-soul, but rather (as with Plato) in the guise of a receptive or passive principle in contrast to the formative or active. What the world-soul sees in the *nous*, with that it is pervaded and that it strives to reproduce. The content of the soul descends to lower stages. This content is composed of the ideas; and thus in the image of the *nous* and soul images of the ideas are also contained. These are the *logoi*, concepts, whose sum, the *Logos par excellence*, like the world-soul itself, is an emanation from the *nous*. These *logoi* are the essential factor in the giving of form to matter, which is formed in an organic, not a mechanical, manner. This formative process presupposes purpose, but not knowledge or deliberation-just as in Heraclitus all becoming takes place on rational principles, yet without any conscious foresight. If everything, therefore, is formed and pervaded by rational powers, the world-soul with its content permeating all, all must be rational or reason. Although the *logoi* are lower than their prototypes, and their relations with formless matter go lower still, yet Plotinus finds in the world of phenomena traces of the highest; the absolutely Good and Beautiful is visible even in the world of sense. The spirit of Plato, as expressed in the close of the *Timoeus*, the idea that the sensible world is a great and beautiful and perfect thing, dominates Plotinus also, so that in spite of matter producing evil, he is far from regarding this world as evil or hateful, representing rather in this point the general optimism of Greek philosophy than the tendency of the early Christian writers to despise the visible world. On the whole, in his explanation of the existence of evil in the universe and his justification of the higher powers in respect to it, he follows the Stoics.

RELIGION AND ETHICS. From the world-soul proceed individual souls, but they are not parts of it. Going down into bodies, they have forgotten the higher, the divine, from which they came, and have believed themselves independent. Thus, they have gone continually lower, and stand in need of a return to the better. Plotinus does not make it plain whether this can be executed With freedom by men. The ethical goal is sometimes represented, after Plato, as approximation to the Godhead, sometimes in a more Aristotelian fashion as operation in conformity with the nature of the operator, and again, with Heraclitus and the Stoics, as obedience to reason. Among the virtues Plotinus distinguishes first the "political" or social, which are the four commonly accepted by the Greeks-prudence, courage, temperance, and justice; but these can not make the soul like God. Above them are the purifying virtues, which have that effect. They consist in freeing oneself as far as possible from the body and from sin by an avoidance of what is sensual, though without any exaggerated asceticism. Man, however, is not to be satisfied by mere freedom from sin, but must strive actually to become God. To this end serve the deifying virtues, which are the reproduction on a higher plane of the primary or political virtues. Through these the true nature of man comes to its fulfillment; and thus his beatitude consists in the maintenance of his proper attitude toward himself, undisturbed by external happenings or relations. The supreme aim, indeed, with Plotinus as with Philo, lies not in the realm of thought (as the detailed exposition of the deifying virtues

might suggest), but in ecstatic elevation to the highest good, to the Godhead. Logical knowledge is only a preliminary to this, which consists in immediate knowledge of and union with God. To this Plotinus himself, according to the testimony of Porphyry, attained only four times in the six years that the disciple was with him. The reason why man on earth can not remain permanently in this state is that he has not yet succeeded in turning wholly away from the earthly; the time of permanent union will come when he is no longer tormented by any restlessness of the body. On the immortality of the soul Plotinus wrote a separate treatise, in which he follows Plato in the main, especially emphasizing the fact that the soul, as incorporeal and incomposite, is incapable of dissolution. A reunion of soul and body in the after life is inconceivable to him, since the passage into this higher life is conditioned by the desertion of the body, whose nature is in essential opposition to that of the soul.

Pluralism

"Pluralism" denotes any metaphysical theory which claims that reality consists of a multiplicity of distinct, fundamental entities. The term was first used by Christian Wolff (1679-1754), and later popularized by William James in *The Will to Believe.* Pluralism is distinguished from both monism, the view that one kind of thing exists, and dualism, the view that two kinds of things exist. There are weak and strong forms of pluralism theories. The weak form holds that there are many distinct *individual* things, whereas the strong form holds that there are many distinct *kind* of things. Theories dealing with the number of entities are referred to as substantival, and theories dealing with the type of entities are referred to as attributive.

Theories of monism have varied greatly throughout the history of Western philosophy. In Presocratic Ionian philosophy, the universe is composed of the four primaries: air, water, fire, and earth. Thus, the origins of all things could be traced back to one or a combination of two or more of these primaries. Anaxagoras, however, held that the number of substances in the universe was infinitely great and cannot be numbered. Aristotle is sometimes classified as a pluralist given his view that reality is composed of individual substances (material objects with an essence). Leibniz held that all things are made up of monads, that is, elemental substances whose principal attribute is perception. They are infinite in number, and change according to their proximity with one another. As they perceive their neighboring monads, and change accordingly, they compose the things we use such as tables and chairs. Herbart described his ontology as a "pluralistic realism." This means that reality is made up of simple qualitative units for which he gave the name "reals." These join together in syntheses that lead to the world we perceive. In A Pluralistic Universe, William James explains pluralism in the world in terms of the dominance of external relations. James objected to monism on the grounds that it put too much emphasis on totality, and tended to exclude individuality and free will. In *A Pluralistic Universe* , James associates his concept of pluralism with the dominance of external relationships in the world. Bertrand Russell's account of logical atomism was pluralistic insofar as it was founded on the "common sense belief that there are many separate things. Later abandoning the view of logical atomism, Russell still held to pluralism given his conviction that the universe lacked a continuity and orderliness.

Contrary to Russell, one difficulty with pluralistic theories is the fact that there seems to be an underlying coherence in the universe, which suggests that there is some single shared feature, perhaps as expressed in monistic theories. Without a point of commonality, things would be in complete chaos. Further, Ordinary language philosophers, such as G.E. Moore and Wittgenstein, argue that no categories of the understanding account for the real world, whether these categories are pluralistic, monistic, or dualistic. Instead, there are there are hundreds of boxes in which to classify things.

Jules Henri Poincaré (1854-1912)

Jules Henri Poincaré was a mathematician, physicist, and philosopher of science. He is best known to philosophers for his forceful development of the philosophical doctrine of conventionalism.

Contents.

LIFE. Poincaré was born on April 29,1854 in Nancy and died on July 17, 1912 in Paris. Poincaré's family was influential. His cousin Raymond was the President and the Prime Minister of France, and his father Leon was a professor of medicine at the University of Nancy. His sister Aline married the spiritualist philosopher Emile Boutroux.

Poincaré studied mining engineering, mathematics and physics in Paris. Beginning in 1881, he taught at the University of Paris. There he held the chairs of Physical and Experimental Mechanics, Mathematical Physics and Theory of Probability, and Celestial Mechanics and Astronomy.

At the beginning of his scientific career, in his doctoral dissertation of1879, Poincaré devised a new way of studying the properties of functions defined by differential equations. He not only faced the question of determining the integral of such equations, but also was the first person to study the general geometric properties of these functions. He clearly saw that this method was useful in the solution of problems such as the stability of the solar system, in which the question is about the qualitative properties of planetary orbits (for example, are orbits regular or chaotic?) and not about the numerical solution of gravitational equations. During his studies on differential equations, Poincaré made use of Lobachevsky's non-Euclidean geometry. Later, Poincaré applied to celestial mechanics the methods he had introduced in his doctoral dissertation. His research on the stability of the solar system opened the door to the study of chaotic deterministic systems; and the methods he used gave rise to algebraic topology.

Poincaré sketched a preliminary version of the special theory of relativity and stated that the velocity of light is a limit velocity and that mass depends on speed. He formulated the principle of relativity, according to which no mechanical or electromagnetic experiment can discriminate between a state of uniform motion and a state of rest, and he derived the Lorentz transformation. His fundamental theorem that every isolated mechanical system returns after a finite time [the Poincaré Recurrence Time] to its initial state is the source of many philosophical and scientific analyses on entropy. Finally, he clearly

understood how radical is quantum theory's departure from classical physics.

Poincaré was deeply interested in the philosophy of science and the foundations of mathematics. He argued for conventionalism and against both formalism and logicism. Cantor's set theory was also an object of his criticism. He wrote several articles on the philosophical interpretation of mathematical logic. During his life, he published three books on the philosophy of science and mathematics. A fourth book was published posthumously in 1913.

CHAOS AND THE SOLAR SYSTEM. In his research on the three-body problem, Poincaré became the first person to discover a chaotic deterministic system. Given the law of gravity and the initial positions and velocities of the only three bodies in all of space, the subsequent positions and velocities are fixed--so the three-body system is deterministic. However, Poincaré found that the evolution of such a system is often chaotic in the sense that a small perturbation in the initial state such as a slight change in one body's initial position might lead to a radically different later state than would be produced by the unperturbed system. If the slight change isn't detectable by our measuring instruments, then we won't be able to predict which final state will occur. So, Poincaré's research proved that the problem of determinism and the problem of predictability are distinct problems.

From a philosophical point of view, Poincaré's results did not receive the attention that they deserved. Also the scientific line of research that Poincaré opened was neglected until meteorologist Edward Lorenz, in 1963, rediscovered a chaotic deterministic system while he was studying the evolution of a simple model of the atmosphere. Earlier, Poincaré had suggested that the difficulties of reliable weather predicting are due to the intrinsic chaotic behavior of the atmosphere. Another interesting aspect of Poincaré's study is the real nature of the distribution in phase space of stable and unstable points, which are so mixed that he did not try to make a picture of their arrangement. Now we know that the shape of such distribution is fractal-like. However, the scientific study of fractals did not begin until Benoit Mandelbrot's work in 1975, a century after Poincaré's first insight.

Why was Poincaré's research neglected and underestimated? The problem is interesting because Poincaré was awarded an important scientific prize for his research; and his research in celestial mechanics was recognized to be of fundamental importance. Probably there were two causes. Scientists and philosophers were primarily interested in the revolutionary new physics of relativity and quantum mechanics, but Poincaré worked with classical mechanics. Also, the behavior of a chaotic deterministic system can be described only by means of a numerical solution whose complexity is staggering. Without the help of a computer the task is almost hopeless.

ARITHMETIC, INTUITION AND LOGIC. Logicists such as Bertrand Russell and Gottlob Frege believed that mathematics is basically a branch of symbolic logic, because they supposed that mathematical terminology can be defined using only the terminology of logic and because, after this translation of terms, any mathematical theorem can be shown to be a restatement of a theorem of logic. Poincaré objected to this logicist program. He was an intuitionist who stressed the essential role of human intuition in the foundations of mathematics. According to Poincaré, a definition of a mathematical entity is not the exposition of the essential properties of the entity, but it is the construction of the entity itself; in other words, a legitimate mathematical definition creates and justifies its object. For Poincaré, arithmetic is a synthetic science whose objects are not independent from human thought.

Poincaré made this point in his investigation of Peano's axiomatization of arithmetic. Italian mathematician Giuseppe Peano (1858-1932) axiomatized the mathematical theory of natural numbers.

This is the arithmetic of the nonnegative integers. Apart from some purely logical principles, Peano employed five mathematical axioms. Informally, these axioms are:

1. Zero is a natural number.
2. Zero is not the successor of any natural number.
3. Every natural number has a successor, which is a natural number.
4. If the successor of natural number *a* is equal to the successor of natural number *b*, then *a* and *b* are equal.
5. Suppose:
   (i) zero has a property P;
   (ii) if every natural number less than *a* has the property P then *a* also has the property P.
   Then every natural number has the property P. (This is the principle of complete induction.)

Bertrand Russell said Peano's axioms constitute an implicit definition of natural numbers, but Poincaré said they do only if they can be demonstrated to be consistent. They can be shown consistent only by showing there is some object satisfying these axioms. From a general point of view, an axiom system can be conceived of as an implicit definition only if it is possible to prove the existence of at least one object that satisfies all the axioms. Proving this is not an easy task, for the number of consequences of Peano axioms is infinite and so a direct inspection of each consequence is not possible. Only one way seems adequate: we must verify that if the premises of an inference in the system are consistent with the axioms of logic, then so is the conclusion. Therefore, if after n inferences no contradiction is produced, then after n+1 inferences no contradiction will be either. Poincaré argues that this reasoning is a vicious circle, for it relies upon the principle of complete induction, whose consistency we have to prove. (In 1936, Gerhard Gentzen proved the consistency of Peano axioms, but his proof required the use of a limited form of transfinite induction whose own consistency is in doubt.) As a consequence, Poincaré asserts that if we can't noncircularly establish the consistency of Peano's axioms, then the principle of complete induction is surely not provable by means of general logical laws; thus it is not analytic, but it is a synthetic judgment, and logicism is refuted. It is evident that Poincaré supports Kant's epistemological viewpoint on arithmetic. For Poincaré, the principle of complete induction, which is not provable via analytical inferences, is a genuine synthetic a priori judgment. Hence arithmetic cannot be reduced to logic; the latter is analytic, while arithmetic is synthetic.

The synthetic character of arithmetic is also evident if we consider the nature of mathematical reasoning. Poincaré suggests a distinction between two different kinds of mathematical inference: *verification* and *proof*. Verification or proof-check is a sort of mechanical reasoning, while proof-creation is a fecund inference. For example, the statement '2+2 = 4' is verifiable because it is possible to demonstrate its truth with the help of logical laws and the definition of sum; it is an analytical statement that admits a straightforward verification. On the contrary, the general statement (the commutative law of addition)

For any x and any y, $x + y = y + x$

is not directly verifiable. We can choose an arbitrary pair of natural numbers a and b, and we can verify that $a+b = b+a$; but there is an infinite number of admissible choices of pairs, so the verification is always incomplete. In other words, the verification of the commutative law is an analytical method by means of which we can verify every particular instance of a general theorem, while the proof of the theorem itself is synthetic reasoning which really extends our knowledge, Poincaré believed.

Another aspect of mathematical thinking that Poincaré analyzes is the different roles played by intuition

and logic. Methods of formal logic are elementary and certain, and we can surely rely on them. However, logic does not teach us how to build a proof. It is intuition that helps mathematicians find the correct way of to assemble basic inferences into a useful proof. Poincaré offers the following example. An unskilled chess player who watches a game can verify whether a move is legal, but he does not understand why players move certain pieces, for he does not see the plan which guides players' choices. In a similar way, a mathematician who uses only logical methods can verify every inference in a given proof, but he cannot find an original proof. In other words, every elementary inference in a proof is easily verifiable through formal logic, but the invention of a proof requires the understanding -- grasped by intuition -- of the general scheme, which directs mathematician's efforts towards the final goal.

Logic is -- according to Poincaré -- the study of properties which are common to all classifications. There are two different kinds of classifications: *predicative* classifications, which are not modified by the introduction of new elements; and *impredicative* classifications, which are modified by new elements. Definitions as well as classifications are divided into predicative and impredicative. A set is defined by a law according to which every element is generated. In the case of an infinite set, the process of generating elements is unfinished; thus there are always new elements. If their introduction changes the classification of already generated objects, then the definition is impredicative. For example, look at phrases containing a finite number of words and defining a point of space. These phrases are arranged in alphabetical order and each of them is associated with a natural number: the first is associated with number 1, the second with 2, etc. Hence every point defined by such phrases is associated with a natural number. Now suppose that a new point is defined by a new phrase. To determine the corresponding number it is necessary to insert this phrase in alphabetical order; but such an operation modifies the number associated with the already classified points whose defining phrase follows, in alphabetical order, the new phrase. Thus this new definition is impredicative.

For Poincaré, impredicative definitions are the source of antinomies in set theory, and the prohibition of impredicative definitions will remove such antinomies. To this end, Poincaré enunciates the vicious circle principle: a thing cannot be defined with respect to a collection that presupposes the thing itself. In other words, in a definition of an object, one cannot use a set to which the object belongs, because doing so produces an impredicative definition. Poincaré attributes the vicious circle principle to French mathematician J. Richard. In 1905, Richard discovered a new paradox in set theory, and he offered a tentative solution based on the vicious circle principle.

Poincaré's prohibition of impredicative definitions is also connected with his point of view on infinity. According to Poincaré, there are two different schools of thought about infinite sets; he called these schools *Cantorian* and *Pragmatist*. Cantorians are realists with respect to mathematical entities; these entities have a reality that is independent of human conceptions. The mathematician discovers them but does not create them. Pragmatists believe that a thing exists only when it is the object of an act of thinking, and infinity is nothing but the possibility of the mind's generating an endless series of finite objects. Practicing mathematicians tend to be realists, not pragmatists or intuitionists. This dispute is not about the role of impredicative definitions in producing antinomies, but about the independence of mathematical entities from human thinking.

CONVENTIONALISM AND THE PHILOSOPHY OF GEOMETRY. The discovery of non-Euclidean geometries upset the commonly accepted Kantian viewpoint that the true structure of space can be known apriori. To understand Poincaré's point of view on the foundation of geometry, it helps to remember that, during his research on functions defined by differential equations, he actually used

non-Euclidean geometry. He found that several geometric properties are easily provable by means of Lobachevsky geometry, while their proof is not straightforward in Euclidean geometry. Also, Poincaré knew Beltrami's research on Lobachevsky's geometry. Beltrami (Italian mathematician, 1835-1899) proved the consistency of Lobachevsky geometry with respect to Euclidean geometry, by means of a translation of every term of Lobachevsky geometry into a term of Euclidean geometry. The translation is carefully chosen so that every axiom of non-Euclidean geometry is translated into a theorem of Euclidean geometry. Beltrami's translation and Poincaré's study of functions led Poincaré to assert that:

- Non-Euclidean geometries have the same logical and mathematical legitimacy as Euclidean geometry.
- All geometric systems are equivalent and thus no system of axioms may claim that it is the true geometry.
- Axioms of geometry are neither synthetic a priori judgments nor analytic ones; they are conventions or 'disguised' definitions.

According to Poincaré, all geometric systems deal with the same properties of space, although each of them employs its own language, whose syntax is defined by the set of axioms. In other words, geometries differ in their language, but they are concerned with the same reality, for a geometry can be translated into another geometry. There is only one criterion according to which we can select a geometry, namely a criterion of economy and simplicity. This is the very reason why we commonly use Euclidean geometry: it is the simplest. However, with respect to a specific problem, non-Euclidean geometry may give us the result with less effort. In 1915, Albert Einstein found it more convenient, the conventionalist would say, to develop his theory of general relativity using non-Euclidean rather than Euclidean geometry. Poincaré's realist opponent would disagree and say that Einstein discovered space to be non-Euclidean.

Poincaré's treatment of geometry is applicable also to the general analysis of scientific theories. Every scientific theory has its own language, which is chosen *by convention*. However, in spite of this freedom, the agreement or disagreement between predictions and facts is not conventional but is substantial and objective. Science has an objective validity. It is not due to chance or to freedom of choice that scientific predictions are often accurate.

These considerations clarify Poincaré's conventionalism. There is an objective criterion, independent of the scientist's will, according to which it is possible to judge the soundness of the scientific theory, namely the accuracy of its predictions. Thus the principles of science are not set by an arbitrary convention. In so far as scientific predictions are true, science gives us objective, although incomplete, knowledge. The freedom of a scientist takes place in the choice of language, axioms, and the facts that deserve attention.

However, according to Poincaré, every scientific law can be analyzed into two parts, namely a *principle*, that is a conventional truth, and an *empirical law*. The following example is due to Poincaré. The law:

> Celestial bodies obey Newton's law of gravitation

The law consists of two elements:

1. Gravitation follows Newton law.
2. Gravitation is the only force that acts on celestial bodies.

We can regard the first statement as a principle, as a convention; thus it becomes the definition of

gravitation. But then the second statement is an empirical law.

Poincaré's attitude towards conventionalism is illustrated by the following statement, which concluded his analysis on classical mechanics in *Science and Hypothesis*:

> Are the laws of acceleration and composition of forces nothing but arbitrary conventions? Conventions, yes; arbitrary, no; they would seem arbitrary if we forgot the experiences which guided the founders of science to their adoption and which are, although imperfect, sufficient to justify them. Sometimes it is useful to turn our attention to the experimental origin of these conventions.

SCIENCE AND HYPOTHESIS. According to Poincaré, although scientific theories originate from experience, they are neither verifiable nor falsifiable by means of the experience alone. For example, look at the problem of finding a mathematical law that describes a given series of observations. In this case, representative points are plotted in a graph, and then a simple curve is interpolated. The curve chosen will depend both on the experience which determines the representative points and on the desired smoothness of the curve even though the smoother the curve the more that some points will miss the curve. Therefore, the interpolated curve -- and thus the tentative law -- is not a direct generalization of the experience, for it 'corrects' the experience. The discrepancy between observed and calculated values is thus not regarded as a falsification of the law, but as a correction that the law imposes on our observations. In this sense, there is always a necessary difference between facts and theories, and therefore a scientific theory is not directly falsifiable by the experience.

For Poincaré, the aim of the science is to prediction. To accomplish this task, science makes use of generalizations that go beyond the experience. In fact, scientific theories are hypotheses. But every hypothesis has to be continually tested. And when it fails in an empirical test, it must be given up. According to Poincaré, a scientific hypothesis which was proved untenable can still be very useful. If a hypothesis does not pass an empirical test, then this fact means that we have neglected some important and meaningful element; thus the hypothesis gives us the opportunity to discover the existence of an unforeseen aspect of reality. As a consequence of this point of view about the nature of scientific theories, Poincaré suggests that a scientist must utilize few hypotheses, for it is very difficult to find the wrong hypothesis in a theory which makes use of many hypotheses.

For Poincaré, there are many kinds of hypotheses:

- Hypotheses which have the maximum scope, and which are common to all scientific theories (for example, the hypothesis according to which the influence of remote bodies is negligible). Such hypotheses are the last to be changed.
- Indifferent hypotheses that, in spite of their auxiliary role in scientific theories, have no objective content (for example, the hypothesis that unseen atoms exist).
- Generalizations, which are subjected to empirical control; they are the true scientific hypotheses.

Regarding Poincaré's point of view about scientific theories, the following have the most lasting value:

- Every scientific theory is a hypothesis that had to be tested.
- Experience suggests scientific theories; but experience does not justify them.
- Experience alone is unable to falsify a theory, for the theory often corrects the experience.
- A central aim of science is prediction.

- The role of a falsified hypothesis is very important, for it throws light on unforeseen conditions.
- Experience is judged according to a theory.

Political Realism

Political realism is a theory of political philosophy that attempts to explain, model, and prescribe political relations. It takes as its assumption that power is (or ought to be) the primary end of political action, whether in the domestic or international arena. In the domestic arena, the theory asserts that politicians do, or should, strive to maximize their power, whilst on the international stage, nation states are seen as the primary agents that maximize, or ought to maximize, their power. The theory is therefore to be examined as either a prescription of what ought to be the case, that is, nations and politicians ought to pursue power or their own interests, or as a description of the ruling state of affairs-that nations and politicians only pursue (and perhaps only can pursue) power or self-interest.

Political realism in essence reduces to the political-ethical principle that might is right. The theory has a long history, being evident in Thucydides' *Pelopennesian War*. It was expanded on by Machiavelli in *The Prince*, and others such as Thomas Hobbes, Spinoza, and Jean-Jacques Rousseau followed (the theory was given great dramatical portrayed in Shakespeare's *Richard III*). In the late nineteenth century it underwent a new incarnation in the form of social darwinism, whose adherents explained social and hence political growth in terms of a struggle in which only the fittest (strongest) cultures or polities would survive. Political realism assumes that interests are to be maintained through the exercise of power, and that the world is characterised by competing power bases. In international politics, most political theorists emphasise the nation state as the relevant agent, whereas Marxists focus on classes. Prior to the French Revolution in which nationalism as a political doctrine truly entered the world's stage, political realism involved the political jurisdictions of ruling dynasties, whilst in the nineteenth century, nationalist sentiments focused realists' attentions on the development of the nation-state, a policy that was later extended to include imperialist ambitions on the part of the major Western powers-Britain and France, and even Belgium, Germany and the United States were influenced by imperialism. Nationalist political realism later extended into geo-political theories, which perceive the world to be divided into supra-national cultures, such as East and West, North and South, Old World and New World, or focusing on the pan-national continental aspirations of Africa, Asia, etc. Whilst the social darwinist branch of political realism may claim that some nations are born to rule over others (being 'fitter' for the purpose, and echoing Aristotle's ruminations on slavery in Book 1 of the *The Politics*), generally political realists focus on the need or ethic of ensuring that the relevant agent (politician, nation, culture) must ensure its own survival by securing its own needs and interests before it looks to the needs of others.

To explore the various shades and implications of the theory, its application to international affairs is examined.

Descriptive political realism commonly holds that the international community is characterized by anarchy, since there is no overriding world government that enforces a common code of rules. Whilst this anarchy need not be chaotic, for various member states of the international community may engage in treaties or in trading patterns that generate an order of sorts, most theorists conclude that law or morality

does not apply beyond the nation's boundaries. Arguably political realism supports Hobbes's view of the state of nature, namely that the relations between self-seeking political entities are necessarily a-moral. Hobbes asserts that without a presiding government to legislate codes of conduct, no morality or justice can exist: "Where there is no common Power, there is no Law: where no Law, no Injustice… if there be no Power erected, or not great enough for our security; every man will and may lawfully rely on his own strength and art, for caution against all other men." (Hobbes, *Leviathan*, Part I, Ch.13 'Of Man', and Part II, Ch.17, 'Of Commonwealth') Accordingly, without a supreme international power or tribunal, states view each other with fear and hostility, and conflict, or the threat thereof, is endemic to the system.

Another proposition is that a nation can only advance its interests against the interests of other nations; this implies that the international environment is inherently unstable. Whatever order may exists breaks down when nations compete for the same resources, for example, and war may follow. In such an environment, the realists argue, a nation has only itself to depend on.

Either descriptive political realism is true or it is false. If it is true, it does not follow, however, that morality ought not to be applied to international affairs: what ought to be does not always follow from what is. A strong form of descriptive political realism maintains that nations are necessarily self-seeking, that they can only form foreign policy in terms of what the nation can gain, and cannot, by their very nature, cast aside their own interests. However, if descriptive realism is held, it is as a closed theory, which means that it can refute all counter-factual evidence on its own terms (for example, evidence of a nation offering support to a neighbour as an ostensible act of altruism, is refuted by pointing to some self-serving motive the giving nation presumably has--it would increase trade, it would gain an important ally, it would feel guilty if it didn't, and so on), then any attempt to introduce morality into international affairs would prove futile. Examining the soundness of descriptive political realism depends on the possibility of knowing political motives, which in turn means knowing the motives of the various officers of the state and diplomats. The complexity of the relationship between officers' actions, their motives, subterfuge, and actual foreign policy makes this a difficult if not impossible task, one for historians rather than philosophers. Logically, the closed nature of descriptive realism implies that a contrary proposition that nations serve no interests at all, or can only serve the interests of others, could be just as valid. The logical validity of the three resulting theories suggests that preferring one position to another is an arbitrary decision-i.e., an assumption to be held, or not. This negates the soundness of descriptive realism; it is not a true or false description of international relations but is reduced to an arbitrary assumption. Assumptions can be tested against the evidence, but in themselves cannot be proved true or false. Finally, what is the case need not be, nor need it ought to be.

That the present international arena of states is characterized by the lack of an overarching power is an acceptable description. Evidentially, war has been common enough to give support to political realism-there have been over 200 wars and conflicts since the signing of the Treaty of Westphalia in 1648. The seemingly anarchic state of affairs has led some thinkers to make comparisons with domestic anarchy, when a government does not exist to rule or control a nation. Without a world power, they may reason, war, conflict, tension, and insecurity have been the regular state of affairs; they may then conclude that just as a domestic government removes internal strife and punishes local crime, so too ought a world government control the activities of individual states-overseeing the legality of their affairs and punishing those nations that break the laws, and thereby calming the insecure atmosphere nations find themselves in. However, the 'domestic analogy' makes the presumption that relations between individuals and relations between states are the same. Christian Wolff, for example, holds that "since states are regarded as individual free persons living in a state of nature, nations must also be regarded in

relation to each other as individual free persons living in a state of nature." (*Jus Gentium Methodo Scientifica Pertractatum* Trans. Joseph Drake. Clarendon Press: Oxford, 1934, §2, p.9). Such an argument involves the collectivization of individuals and/or the personification of states: realism may describe nations as individuals acting upon the world stage to further their own interests, but behind the concept of 'France' or 'South Africa' exist millions of unique individuals, who may or may not agree with the claims for improving the national interest. Some (e.g., Gordon Graham, *Ethics and International Relations*, 1997) claim that the relationships between states and their civilians are much more different than those between nation states, since individuals can hold beliefs and can suffer whereas states cannot. If the domestic analogy does not hold, arguably a different theory must be proposed to explain the state of international affairs, which either means revising political realism to take into account the more complex relationship between a collective and individual entities, or moving to a alternative theory of international relations.

Beyond the descriptive propositions of political realism, prescriptive political realism argues that whatever the actual state of international affairs, nations should pursue their own interests. This theory resolves into various shades depending on what the standard of the national interest is claimed to be and the moral permissibility of employing various means to desired ends. Several definitions may be offered as to what ought to comprise the national interest: more often than not the claims invoke the need to be economically and politically self-sufficient, thereby reducing dependency on untrustworthy nations.

The argument in supporting the primacy of self-sufficiency as forming the national interest has a long history: Plato and Aristotle both argued in favour of economic self-sufficiency on grounds of securing a nation's power-nations, they both reasoned, should only import non-necessary commodities. The power of this economic doctrine has been often been used to support political realism: in the eighteenth century especially, political theorists and mercantilists maintained that political power could only be sustained and increased through reducing a nation's imports and increasing its exports. The common denominator between the two positions is the proposition that a nation can only grow rich at the expense of others. If England's wealth increases, France's must concomitantly decrease. This influential tier supporting political realism is, however, unsound. Trade is not necessarily exclusively beneficial to one party: it is often mutually beneficial. The economists Adam Smith and David Ricardo explained the advantages to be gained by both parties from free, unfettered trade. Nonetheless, the realist may admit this and retort that despite the gains from trade, nations should not rely on others for their sustenance, or that free trade ought not to be supported since it often implies undesired cultural changes. In that respect, the nation's interests are defined as lying over and above any material benefits to be gained from international collaboration and co-operation. The right to a separate cultural identity is a separate

Political realists are often characterised as a-moralists, that any means should be used to uphold the national interest, but a poignant criticism is that the definition of morality is being twisted to assume that acting in one's own or one's nation's interests is immoral or amoral at best. This is an unfair claim against serving one's national interest, just as claiming that any self-serving action is necessarily immoral on the personal level. The discussion invokes the ethics of impartiality; those who believe in a universal code of ethics argue that a self-serving action that cannot be universalized is immoral. However, universalism is not the only standard of ethical actions. Partiality, it can be claimed, should play a role in ethical decisions; partialists deem it absurd that state officials should not give their own nation greater moral weight over other nations, just as it would be absurd for parents to give equal consideration to their children and others' children. But if morality is employed in the sense of being altruistic, or at least universalistic, then political realists would rightly admit that attempting to be moral will be detrimental to

the national interest or for the world as a whole, and therefore morality ought to be ignored. But, if morality accepts the validity of at least some self-serving actions, then *ipso facto* political realism may be a moral political doctrine.

Prima Facie Duties

A *prima facie* duty is a moral obligations which are initially binding until a stronger and overriding obligation emerges. The term is associated with W.D. Ross in Chapter 2 of his work, *The Right and the Good* (1930). Ross argues that we intuitively perceive a small set of foundational prima facie duties which are the basis of all moral judgments. Ross begins by attacking consequentialist approaches to morality, specifically utilitarianism. We keep promises, Ross argues, because it is our obligation, and not because of the beneficial consequences of doing so. Utilitarians typically defend their theory arguing that when two moral obligations conflict, we clearly choose the course of action with the best consequences. In response, Ross argues that it is better to resolve such moral conflicts by appealing to our strongest duty, irrespective of consequences. Adopting the terminology from the field of jurisprudence, Ross argues that these rank-ordered duties are best described as prima facie duties (Latin for first appearance). For example, if Aunt Martha asks me what I think about her new hat, I have a foundational duty to be truthful. However, if her hat is ugly, I risk hurting her by being truthful. In this situation, my greater obligation is to avoid hurting her. Thus, my duties of truthfulness and nonharm both begin as prima facie duties, but my duty of nonharm emerges as my actual duty.

Ross lists the following seven foundational prima facie duties: promise keeping, reparation for harm done, gratitude, justice, beneficence, self-improvement, and non-maleficence. He continues with points of clarification. First, this above list of moral principles emphasizes the personal character of duty (based on what one actually deserves), unlike utilitarianism which pursues general happiness with minimal consideration of which specific individuals benefit. Second, against virtue theory, Ross argues that in fulfilling our duty, performing the act is of primary importance, and our specific motives do not matter. Third, he believes that the list of duties he provides is not complete, but is essentially correct, Finally, he explains that there is no single principle we can appeal to that will determine which of our various prima facie duties at a given time is our actual duty.

Ross next argues that his list of prima facie duties can be arranged according to the intrinsic goods from which they arise. An intrinsic good is something which is valuable in and of itself, such as pleasure. If there are intrinsic goods, then we clearly have a duty to bring them out. Some duties are based specifically on the intrinsic goodness of pleasure, as experienced by others and ourselves. These are the duties of beneficence (regarding others) and self-improvement (regarding ourselves). Justice also is founded on the intrinsic goodness of pleasure. The duty of non-maleficence is based on ridding intrinsic evils (such as unhappiness). Other duties are derivatives of these four. Reparation involves a duty arising from harm which has been done. Gratitude arises from the beneficence which has been shown to us by others. Promise keeping arises from an act (or verbal agreement) which was intended to place us under obligation. He also notes that there are compound duties which arise from the above seven. Political obedience, for example, arises from gratitude for benefits we receive from the state.

Ross recognizes that the manner in which our actual duty emerges from prima facie duties is difficult to articulate. It is similar to the laws of mechanics, he argues, insofar as several forces add together to produce a given tendency. He also notes that we perceive our various prima facie duties by means of a self-evident intuition. Perceiving our actual duty, however, is not self-evident, and cannot be logically deduced. Thus, our judgments regarding our actual duties may be subject to error. Our perception of our prima facie duties is an intuition which develops as we mature. We begin with an understanding that a type of act is prima facie right. Through reflection, we then see that this type of act is our duty. Ross concludes by conceding that throughout his discussion he makes continual appeals to common moral consciousness (that is, what we think about moral issues). He argues that our common moral consciousness is in fact founded on our knowledge of morality, and is the cumulative product of the moral reflection of many generations. However, he notes that we should eliminate any contradictions they contain.

The Right to Private Property

Why *Private* Property?

The right to private property[(1)] is the social-political principle that adult human beings may not be prohibited or prevented by anyone from acquiring, holding and trading (with willing parties) valued items not already owned by others. Such a right is, thus, unalienable and, if in fact justified, is supposed to enjoy respect and legal protection in a just human community.

In the development of classical liberalism there emerged in Western political thought a shift of focus as to the prime value in social-political matters, from the group--a tribe, class, state or nation--to the human individual. It started with the effort to gradually transfer power from a few or even one person as the source of collective authority and power to more segments of society involved in exercising such authority and power, leading, eventually, to the sovereignty of the human individual. The way in which power is diffused when individuals are sovereigns rather than groups is through the fact that individuals have only a little and highly diversified power to wield. In consequences, they aren't likely to impose themselves on others by, say, starting a war, even when they disagree very seriously. That, in essence, was the initial motivation for moving toward individualism, which, when implemented via law and public policy, is much more conducive to peace and, as a result, to prosperity than is any form of collectivism. Thus classical liberalism has had some considerable support on practical grounds--its usefulness to attaining various widely sought after objectives.

A major reason, however, that individualism makes better sense than its competitors is that the view that *human beings are primarily parts of a social whole* is wrong. This last is a false notion. When invoked, arguably it tends to serve as a disguise for certain special or vested privileges of some members of society.[(2)] Generalizing such special or vested interests, the values or goals pursued in their name, has been a major source of political acrimony throughout human history. It even continues to drive much of contemporary democratic politics.

There is, however, the problem that as far as its ethical presuppositions and implications are concerned, individualism and in consequences also classical liberalism have not fared all that well. These views are constantly being charged with opposition to community life and human fellowship, hedonism, materialism, and so forth. Even though this is wrongheaded, without a solid moral case it is difficult to show that to be true. The reason is that morality is extremely important in human affairs. Most people do not confidently embrace a political stance unless it manages to embrace certain basic moral principles. Pragmatic reasons thus never suffice to establish the soundness of political systems and public policies.

It is part of the point of this essay to show that private property rights accord with certain basic moral principles. These are the indispensability of human agency in any sensible moral framework and the moral virtue of prudence. I will argue that individualism embraces these principles and that the right to

private property makes their actual realization possible in human community life.

Individuality and Humanity

Human beings have, as one of their distinctive features, a significant element of individuality. Notice, for example, how this comes through in some thought experiments. If a friend dies, it is nonsense to think, "Oh well, I'll just get another friend." You cannot just replace a person with another if you regard him as he really is, most basically, not just as some member of a class of people, such as dentists or auto mechanics. (Even with pets it's difficult to replace them because they become sort of humanized around us.)

On the other hand, with a cow, fly, rock and most other things in the world, replacing them is no problem in one sense because they aren't important *individually*. They're important in their relationship to other things, whereas in the case of human beings it is everyone's individuality that matters most, especially in those most significant personal or intimate relationships. You fall in love with an individual, not a banker--when you really fall in love, that is. (Some people "fall in love" with a type, true enough, but there's something perverse about that -- it is somewhat sad to hear, "Well, I love him because he's in uniform or has a big car.")

Even apart from such common sense observations there is the clear evidence that whenever we consider human beings, we cannot avoid their volitional conduct, actions they choose to bring about on their own.[(3)] In intellectual discussions this is evident in the fact that we criticize one another about what we think, holding our adversaries directly or indirectly responsible for alleged misjudgments.[(4)]

It is a reasonable view, then, that human beings are first and foremost individuals who cause much of what they do. Their actions flow from their thinking and their thinking is the sphere in which they are free, self-determined.[(5)]

Individualism: True and False

Now individualism is associated somewhat uncomfortably with classical liberalism. The reason is that some have overemphasized the element of individuality, making it seem that we are not also members of communities, even of the human race. Such "atomistic" individualism has made it seem that classical liberalism is tied to a misguided social philosophy. An example of it may be found in the oft repeated story, by economists, of Robinson Crusoe. If one models human life on Crusoe's story and his interaction with Friday, it appears that we are born capable of self-sufficient productive conduct and from the start choose whether to associated with others. Yet this idea is patently absurd, considering that all human beings are born helpless and grow up in the company of others on whose support they vitally depend.

Yet it is not true that individualism is necessarily committed to atomism. One can fully admit to the communal aspects of human life while insisting that we are essentially individuals, as well. Such a robust, what I have called "classical" individualism, also stresses the importance of the private realm and insists that all bona fide human communities must adhere to the terms individuals set for themselves.

The crucial individualist ingredient of classical liberal social and political theory stresses not some arid independence or isolation of the individual human being but the fact that everyone can make what in principle can be independent judgments as to the kind of communities suitable to one's membership.

Given human nature, the element of choice must be preserved in every suitable human community. This is the source of the classical liberal political principles that demands that the consent of the governed be upheld in public policy as well as personal relations. The criminal nature of murder, assault, kidnapping, rape, robbery, burglary and so forth all make sense in terms of this classical or moderate individualism first found in Aristotle philosophy.(6)

Individuality and Privacy

The gist of individualism is, then, that everyone must consent to being used by another. This is because each is important, valuable in his or her own right. And if an individual is important as such, then there is a sphere that constitutes the individual's realm of sovereignty and others ought to respect it, the realm within which one must make effective judgments about one's life. And indeed in classical liberal, political, and legal theory there's a great deal of emphasis on individual rights rather than rights of families or other groups, bearing on this individualist element of the position. The right to private property is, in turn, the most practically relevant of those individual rights.

The term "privacy," then, underlines this emphasis of the importance of individuals. The right to private property is really just an extension, within the framework of a naturalist world view, of the right to one's own life. It is when one('s life) engages with the rest of the world in the unique way one will do so, and when another will do this in his or her unique way, then privacy becomes important.(7) It will then be possible to actualize and to protect who one is and one's manifestation in the world--one's own art, productivity, creativity, innovation and so forth. None of those, as well, may be used by others without the individual's consent to whom they belong.

Socialism and Humanity

Now consider that one of the interesting things about socialism is that in deep-seeded socialist theory there are no individuals. Marx said it directly: "The human essence is the true collectivity of man."(8) He also noted that human beings constitute specie-beings and comprise "an organic whole" in the collectivity we call humanity.(9) What is important about you and me for a consistent, thoroughgoing socialist is that we belong to the human race, somewhat analogously to the way a bee belongs to its hive or an ant to its colony, only in this case the constituent parts are intelligent persons.

This is especially true of international socialism, but National Socialism and even more restrictive, local forms of socialism, emphasize the group as a whole and *its* plan, telos or destiny. Even communitarians, as vague as their conception of a community comes to (so that one cannot pin them down as socialists because they leave room for some elements of individualism), speak mostly of concerns in behalf of "us" and use the term "we" to designate the primarily valued party when discussing public policy. The individual can then, at times, be sacrificed if some gains are made for the group, collective or community.

Classical Liberalism, Human Nature & Individuality

Yet, if we examine human life carefully, we notice clearly that there is something irreducibly, inescapably, individual about everybody. Just think about yourself. How do you insist on being regarded

by friends and others close to you? As a student? An American or Rumanian or Hispanic? Or as a woman or basketball player? Is there not in fact something unique that is the *you* that captures who you are? One's *identity* isn't racial, ethnic, religious or even professional. It is individual. As John Quincy Adams said in the motion picture *Amistad*, ask not *what* someone is but *who* someone is to come to know the person.

It's in classical liberalism that this is acknowledged more than in any other political philosophy. There's always been a little bit of emphasis on individuality, of course, in various rebellious political movements, but it's very difficult to maintain the supremacy of the tribe or, later, the state if one admits that what is truly important in a human society is the individuals who comprise it, as individuals. Because then one can't reasonably say, "Well, we can do away with that individual or with that group of individuals or their projects so as to benefit some others, including some collective such as the state, community, culture or race."

Indeed, with the recognition and acknowledgment of the supreme value of the individual, the very definition of a "good" or "just" society would have to emphasize the freedom and happiness of individuals.

In fact, a characteristic of the classical liberal political ethos is that one scrutinizes a society for its quality, its goodness, and its justice on the basis of how loyal it is to the mission of securing the rights of individuals to their liberty and pursuit of happiness. This is actually a very prominent movement in the world today. It's not done consistently and purely, but all those human rights organizations that go from country to country to check whether they adhere to tenants of justice are at least rhetorically committed to the examination of whether the countries treat their citizens as individuals with rights. Are their projects respected or are they neglected and treated with callous disregard for the choices of individuals?

This is one of the reasons that in a largely liberal--or, for the sake of avoiding confusion with American liberalism, a libertarian--society membership in a class looses its moral and political significance. In the United States of American, for example there are matters that may make no difference to most people, but when they matter to even just one, it is appreciated. I, for one, once worked as a busboy in Cleveland, Ohio, and noticed that when paid, I could go back to the same restaurant and eat a meal there. There was no frowning and shaking of the head and saying, "Wait a minute, you don't belong here." In much of Europe, in contrast, if you work in a restaurant you don't get to eat there--it is not illegal now but it's certainly gosh.

Fluctuating Classes

In a more or less libertarian social-political society the divisions that are based on incidental attributes--one's wealth, color, national origin, ethnicity, race, and so forth--tend to be less significant because one's individual worth trumps all these and classes, at any rate, are always in a flux. Even racial and ethnic, not to mention religious or economic categories tend to shift because there is no widespread and well entrenched legally enforced barriers to either entry to or exit from any of them.

Such categories and the behavior associated with them may still prevail in certain special contexts. For example, a professor will usually attain special respect in the classroom, but when one meets the professor at a restaurant, one will not need to carry over the behavior associated with that classroom status. No "Her Doctor, Doctor," as, for example, in much of Germany, in or outside the classroom. In

most American schools, however, one says, "Hello Professor," but outside the label isn't usually used.

All this can be a bit disturbing because it can sometimes spill over into disrespect for people who in fact deserve respect. Rampant individualism can corrupt into disrespect for all authority. The corruption can but by no means need be generated by the notion that individuals matter primarily as individuals, not so much as members of classes. It is also evident enough that we are social beings, members of the class of human beings, and there are some matters very important about that, too.

The Moral Standing of Private Property Rights

Individualism does, however, underlie the regime of private property rights. But why do we need a separate discussion of the merits of the right to private property? What will such an inquiry yield?

There are at least two answers to that question. One is that when you resist people taking something from you, by taxation, theft or any other means, it is important to know, even if only implicitly, that the resistance is justified. That it is a kind of self-defense, akin to resisting someone assaulting or raping someone else. It is vital to learn that one is in the right and is not doing something merely willful or stubborn or prejudicial, that one is not just being a recalcitrant, antisocial person, when one insists on the integrity of ownership. This is a point widely contested by opponents of classical liberal or libertarian legal orders.

When all things are considered, the most important questions about liberalism and its various tenants is, "Is it true?" "Is classical liberalism or, its purest versions, libertarianism, the way a society ought to be organized?" And, in order to answer that question, one must examine whether its various tenets can withstand challenges, criticisms and so on. Individualism is one of these tenets but the right to private property is the most important practical, public policy element of it.

The second reason we need to examine private property rights is whether system of individual rights, including the right to private property, is a just system? Or is it, as many critics claim, just a figment of some people's imagination?

One of the most prominent and oft-repeated criticisms leveled at classical liberalism, especially by students of various configurations of Marxism--there are about 300 versions now--is that this whole emphasis on individuality is a kind of a historical glitch. It's only a temporary phase in history which had its role but now can be dispensed with.

Individualism and Historicism

The Marxists and many others, some who follow them without knowing it, claim that in the 16th century the individual was *invented*, not merely discovered or his existence politically affirmed, for the sake of sustaining economic productivity. In order to create motivation for wealth-creation, the individual had to be made seem significant. It's a myth, but it's a useful myth. It's like telling someone that she is beautiful when she isn't so that she will do certain things from which certain advantages derive. According to Marxists, there was a period of human history where the belief in the importance of the individual had an objective historical function, not because it's true, but because it contributes to certain crucial elements of capitalism.

There are people who look at history in this way, as if it is the record of the growth of humanity from infancy to full maturity. They then take it that the bourgeois epoch is like the adolescence of an individual. It's a temporary stage and has its usefulness because, typically, adolescents embark upon all sorts of useless ventures--such as getting up at four o'clock to drive some place not because there's something important to do as a sort of exercise to prepare for adulthood. It trains them for the eventual serious challenges of maturity.

When one treats humanity this way, so that it has these various historical stages, individualism can be regarded to be one of those stages. It's a somewhat appealing picture--it fits some images we have of humankind. Ecologists encourage this, as do some moral visionaries who see humanity as a big family or some other kind of collectivity.

Marx explicitly said that the Greek era was the childhood of humanity. He, as I have noted already, and many of those who have been influenced by his thinking believe that humanity is some kind of organism, a being of which individuals are the parts. Humanity goes through stages of organic development, the tribalism its first and communism its final stage. And while the individualist stage in a necessary one, it is certainly not the completed stage of humanity.

Individualist Alternative to Organicism

These challenges have to be answered because they are extremely well developed, plausible enough, and with enormous influence in the world intellectual community. It is a little like when one meets a friend and asks them to explain some event such as their recent divorce and they proceed to give you a very well worked out and sincerely held rationalization as to how things happened. Now, in order to cope with one of these rationalizations, one must get to the heart of the actual situation and demonstrate beyond all reasonable doubt that the story is a different one. One must show that one's understanding of what's going on is more rational, coherent, comprehensive, and explains much more than does theirs. Otherwise the deceptive story will be the only viable account making the rounds, despite its conflict with common sense.

Unless liberalism is able to identify a better story than what those who champion the organic view advance, it will be defeated, at least theoretically. And while that isn't always decisive, it certainly has an impact on the confidence with which the position can be supported and implemented.

Indeed, one of the advantages of anti-liberal doctrines is that so many intellectuals are enchanted by them. They create elaborate and smart stories around them, stories that are extremely appealing and intellectually challenging. For one, such a story gives the intellectual a privileged position. Only intellectuals are in the position to grasp such a complex story, after all. Common sense does not support it. (For example, Marx thought only communists could really understand the truth of such a story, the rest of us having been blinded by our class outlook.)

The Appeal of Collectivism

The idea, for example, that we are all mere parts of a large human organism, humanity, has very a strong intellectual standing in our time. A great many people make reference to humanity--as when they talk about sacrificing oneself or one's private interests or one's materialistic goals for humanity. And others refer to smaller groups--the community or ethnic group or the race--as the organisms that are of

significance.

So it's almost a feature of the mainstream to think of us not as individuals but as parts of some larger whole. "Don't you have something more important to live for than yourself?" "Isn't there something greater than yourself to which your life must be devoted for it to be worthwhile?" Less loosely, some, such as the philosopher Charles Taylor, argue that we all must *belong* to a group, by dint of our very humanity, our nature as human beings. He tells us that "Theories which assert the primacy of rights are those which take as the fundamental, or at least a fundamental, principle of their political theory the ascription of certain rights to individuals which deny the same status to a principle of belonging or obligation, that is a principle which states our obligation as men to belong to or sustain society, or a society of a certain type, or to obey authority or an authority of a certain type."(10) Never mind that Taylor cannot give us any such theories--John Locke, for example, rested basic human rights on ethics or natural law. What is important in what Taylor says is not only that if you just live to make the most of *your* life, you're not really living a *significant enough* life. A significant life must not only fulfill a greater purpose and humanity's purpose is one of the candidates. God's purpose is another candidate. Ecologists have a biological purpose in mind. But a significant life but belong to the effort to pursue this purpose and thus our lives, to be properly significant, may be subordinated, by force, to such purposes.(11)

There's a very prominent tradition of selecting alternative wholes larger than ourselves as the proposed beneficiaries of significant human actions. And this can lead to the whole process of forcing individuals to be used for purposes to which they do not consent. This is the greatest source of coercive thinking in human history. Once it is accepted that human individuals are part of a larger whole they, as members of a partnership or team, have enforceable obligations to the goals of that large whole. They belong to it.

Consider, to appreciate this, how in certain cases we treat such wholes as ourselves. If something happens to one's ear, for example, and yet one prizes one's appearance with an intact ear, then one takes another part of one's body that's not visible and takes part of it so as to replace the ear. The famous Welsh actor, Richard Harris, had his nose destroyed in a fight, so doctors took a part of his hip bone and replaced it, clearly because the nose was more important to an actor than that little part of the hip bone.

Well, if humanity is the larger organism, then maybe a given individual may not be so important a part of it as another. So the less important individual can be sacrificed for the more important one (or the goals of the less important can be sacrificed for those of the more important). One may be an eye and the other just a useless thumb. That picture is widely embraced because of the belief that humanity is some organic whole.

If one recognizes collectivism as a misguided picture of human life, one must carefully and effectively argue in response to these well worked out and often honestly and sincerely meant doctrines. One must demonstrate that it is indeed individuals who count for the most in the human picture. It needs to be proven, some of the widespread opinion to the contrary notwithstanding, that notions such as "individual rights" are universal and not stuck to some limited historical epoch.

The Right to Private Property

One reason that it must be shown that the social regulative principle of a right to private property is sound and that it ought to be respected and protected in human community life is that it is a vital conceptual or logical implication of the individualist story. If individualism is indeed sound, so is the

principle of private property rights. When the right to private property is not respected and not sufficiently protected, then there is something wrong with a community.

This means that it is not quite fit for human inhabitation, given the individuality of every person and how respect for this is a precondition for his or her flourishing.

There are many different ways in which private property has been supported in the history of political economy. Most prominent has been the claim that there should be legal protection of the right private property because this facilitates productivity--a point that's in agreement with Marx, only universalized beyond a given epoch. Protecting this right helps society get rich--not only in the 16th century but always. Both Adam Smith and John Stuart Mill tended to argue along these lines: It's a good thing to have these rights because if we act in terms of them we will have greater prosperity. Many economists today argue a similar point. Indeed, that is one reason many governments engage in privatization, so as to encourage economic growth.

All of this is vital but it isn't what is most important. What needs to be shown is that the individual has these rights regardless of what's done when simply exercising them. Even if individuals waste away their lives, they have that right. It is theirs to waste away, not someone else's, because they are the important element of society, not some outsider, not some other being such as society, the community, the tribe or the ethnic group. It is this element of liberty, the right to choose how one lives, that is most central to human community life, even if, indeed because, as a matter of one's personal life it is equally important to make the right choice, to choose to do the right thing.

That is exactly why the right to private property is vital. When effectively protected, it secures for human individuals a sphere of personal jurisdiction, the right to acquire and hold the props, as it where, with which to order one's life. Moral virtues such as generosity, kindness, courage, moderation, prudence and the rest are all imperatives the practice of which engage one with the natural world. If one is not in charge of some of that world, at least oneself, one cannot conduct oneself virtuously. So the right to one's life, liberty and property are necessary conditions for a morally significant or meaningful life in human communities.

It needs to be noted here, as a significant aside, that even if we are essentially individuals, this doesn't mean we are not also naturally members of societies. But, as moral agents and as candidates for membership in some human communities or societies, we are morally responsible to take into consideration and never neglect the fact that we must judge those societies as to whether they do adequate justice to our individuality, most generally, and whether they best serve our flourishing.

No *Carte Blanche* to Communities

From this it follows that we must always keep in focus the question of whether we ought to live in a given community. Do we--ought we to--want to support this kind of public policy, this kind of a legal system? What is the standard by which we make that kind of decision when we have the chance? At the most basic level of community concern must lie the issue of what principles should govern human communities. The right to private property is one of those principles.

Very often we don't have a direct practical option to act on the choice we make about basic principles. But at least we can think about them so that when we do get a chance to make a significant decision, then we will know where to stand. We owe it to ourselves, to a life of integrity, not to forget about that issue,

ever. That is the highest duty of citizenship!

Property Rights, Individuality and the Moral Life

So what does the right to private property do in connection with the essential human element of individuality?

Well, as already suggested, the right to private property secures for one a sphere of sovereignty. See, if we are individuals, required, morally, to lead our lives by our judgements, it is crucial that we control the elements with which our lives are lived. Indeed, it becomes the most crucial thing.

The question, "How ought I to live?" becomes the foremost question to which you then seek an answer. While we aren't moral theoreticians and ethical philosophers and so on, that question still is always near the forefront of our minds. No matter what you do, even reading these lines, the question will arise: "Should I sleep or should I pay attention? Should I consider this point or should I just glide over it?"

All of those are questions having to do with your ethical agency, with one's governance of one's life, with one's sovereignty. One's feeling that one is doing the right thing becomes crucial if one is indeed the master of one's existence.

No Private Property Rights, No full Moral Agency

Now, without the right to private property, without having some props, some elements of reality that are under our jurisdiction, our ethical decisions cannot be effectual. Consider for example, if it turns out to be true that a good human being ought to be generous. Well, if we do not have the right to private property how are we going to be generous? Are we going to be like politicians and bureaucrats and expropriate what belongs to others and give this to the poor and needy? That's not generosity. That's theft.

In short, then, in order to have a effective life of moral virtue, for example the virtue of generosity, we must have the right to property, to hold and then to be free to part with values, on your own terms.

Moral Individualism

Although collectivism has some currency, especially among intellectuals and social theorists, so does a particular version of individualism. I have in mind the sort that pertains to moral responsibility.

Few people ever quite let go of the idea that some things they and others do are good and some bad things and that those doing them are responsible. When others judge our lives, or when we reflect upon ours, we say, "I did or didn't do the right thing." Moreover, we can go on to consider what we did with what belongs to us--use it well or badly.

Without our sphere of sovereignty, that's manifest in the actual world where we live our lives, we would not be able to act on most moral principles, especially those that involve allocating resources. Are we stingy? But one has to be stingy with something. If one is a neat person, one has to be neat within some sphere that one keeps orderly. If a slob, one will need something that belongs to one that one isn't taking good care of. If those items don't belong to you, if you always have to ask permission of society or the

clan or the tribe of the nation as to what to do with these things, the you are not the effective agents in the disposition of them. And you are then not an effective moral agent either. You cannot take pride in what you achieve, nor feel guilt for your failings. You are basically just a little bit of a cell in this larger organism.

The Virtue of Prudence

Prudence is one of the virtues identified in classical Greece. I want now to discuss it in a little more detail than thus far.

First, in the modern era prudence has been demeaned because the task of taking care of oneself and one's own has been deemed to be instinctual ever since Thomas Hobbes argued that we are all driven to preserve ourselves. But Hobbes rested his case on extrapolating the principles of classical mechanistic physics to human life, a move that is not at all justified. Human beings must choose their conduct, including whether they will serve others' or their own well-being. Prudence, as the ancients saw it, is the virtue one needs to take decent care of oneself.

Later Immanuel Kant argued that since prudence is a motivation that is aligned to one's own interest or inclinations, it is not a moral virtue. Only motives that are totally indifferent as to one's own interest or inclinations can have moral significance, even though we can not know whether we are ever so purely motivated.

Neither Hobbes nor Kant had it right. Prudence is a moral virtue, though not the only or highest on. In any case, a prudent person acts, among other ways, economically. Such a person realizes that one must reserve for the future, put resources away for a rainy day. Such a person isn't reckless in the disposition of the resources over which he or she has control.

But now if we have no right to acquire or hold things then we can't be prudent. We then don't have the decision-making authority to allocate resources in accordance with standards of prudence. On the other hand, if we do have this authority, then we can choose to act prudently.

Prudence and Justice

If in fact it is a moral virtue to be prudent, but it's politically impossible for one to act on that virtue, then there is a basic conflict between ethics and politics. Then the political sphere is not properly *adjusted* to the ethical sphere. Then our ethical agency has not been done sufficient justice by the legal system in which we act.

And, indeed, that is one of the things that is so frustrating in societies where one does not have the right to private property. Not only that one is going to be thwarted in one's efforts to acquire life's necessities, but that one cannot act responsibly. Here what happens is a version of the tragedy of commons.

The tragedy of commons is a problem usually associated with managing the environment. The reason is that most spheres where there are environmental problems are public. The atmosphere, oceans, rivers, large forests and so on are spheres wherein no one is individually responsible. To put it another way, everyone is responsible for the management of such spheres but no one has a clear idea what to do about this responsibility because the limits imposed by private property rights are missing.

When you have a distinct or definite sphere of jurisdiction, however complicated it may be--with various layers of responsibility and delegation--then when something is done wrong, it can be traced to the agent or agents who did it. And when things are done right, again it can be traced to the agent or agents whose responsibility it was to do them right. Without the right to private property this is impossible.

This is one of the reasons that no society can completely abolish private property. It is impossible to act in any sort of responsible way without some sphere of personal jurisdiction.

Moral Responsibility and Private Property

So the right to private property is the concrete manifestation of the possibility of responsible conduct in a community where there are lots of people who need to know what they ought to do and with what they ought to do it. We are talking about a life lived within the context of the natural world. If our bodies are non-existent and we are just living in an illusionary material world, then these matters are of no significance. There is an assumption underlying the right to private property, and indeed many other elements of classical liberalism or libertarianism, namely, that we have a task to live properly in the midst of a natural environment, a natural world. We are not just living a purely immaterial life. Food needs to be grown and distributed, production has to occur. All sorts of concrete, natural tasks need to be carried out in order to facilitate our human lives.

If this natural life turns out to be either illusionary or insignificant, then some of these things loose their importance. Then politics might indeed be subject to different principles, ones that facilitate different goals, different aims from prosperity, flourishing, or other kinds of earthly success. It's not easy to imagine what that would be. Yet, in a philosophical discussion of these issues, one has to contend with the fact that there are alternative basic ideas that are proposed concerning the basic elements of human living. Liberalism has to stand the test of being compared with these alternative pictures.

Naturalism and Politics

The naturalist approach, in the sense we are preparing and forging ways of living within the natural world, is, I am convinced, demonstrably sound. The alternatives tend to be very vaguely and confusedly supported.

There are doctrines in the world that say that all individuality, for example, is a myth. There are Eastern religions that contend that the natural, individual self is an illusion and that in truth, we're all just part of the universal consciousness.

In order to test this, one has to have some criteria by which truth needs to be determined. The naturalist approach rests on the application of criteria that are universally accessible, available to all human beings with their rational faculties intact.

Commerce and Property

Private property rights, of course, makes for the institution of commerce. If you trade goods and services, if you sell them, if you produce them, if you hoard them, if you save them, you have to have some level of jurisdiction over them. If I wanted to trade you my watch for your shirt, then it has to be my watch. Or

I have to have delegated to me the authority of someone whose watch it is. And it has to be your shirt; otherwise there would be no ability or justification in engaging in this trade. I can't sell you this; this belongs to this hotel. But if it belongs to nobody, then I can't even ask the permission of the hotel whether I can sell it or even give it away. So commerce, as well as charity and generosity presuppose the institution of private property rights. Without that institution, these activities cannot be undertaken smoothly, without confusion.

Moral Standing of Political-Economic Systems

One of the questions that arises in the discussion of political philosophy and political economy is whether they have moral standing. When the Left criticizes classical liberals morally because the liberal or libertarian polity makes profit-making possible, what is the answer?

It's not enough to just say, "Well, we just like to make profit." A murderer can just say, "We just like to kill people." That is no justification, clearly.

There are those who argue that a social science such as economics requires nothing from morality--indeed, it is entirely amoral, purely positive or descriptive in its central thrust. But this is a mistake. All human affairs, including economic ones, are permeated with moral issues. In economics, for example, there is the moral (or as Rasmussen and Den Uyl have called it, the meta-normative[(12)]) element of private property rights.

If one does not own anything, no trade can ensue and all the talk of supply and demand must be abandoned in favor of what collectivists tend to support, a sort of share-and-share alike "economy." But to own something means to be in a distinctively normative relationship with others. They are prohibited from taking what belongs to one. They ought not do so and will be penalized, furthermore, if they do.

So the amoral stance on the market economy is doomed to failure. What is needed is a moral or other normative justification of the institution of private property rights.[(13)]

To do that we must analyze human nature as it is manifest in the natural world. Will such an analysis support the institutions of freedom and free markets and give them a stronger moral standing in human society than alternative ones possess?

Morality and Public Affairs

Now there are some who would dismiss all this because there are cases in human community affairs involving innocent helpless persons, one's who meet with natural disaster and may find themselves without any voluntary help when they need it. And that is certain a possibility, even if not a likelihood in a free society. James Sterba, for example, has been arguing for decades that because such cases are possible, the people who find themselves in them have a right to welfare that the legal order may protect. These positive rights, whereby others are required to work for such persons--or part with goods they have worked for in order to support them--come about because it would not be reasonable, Sterba argues, to demand that such people respect private property rights. It would be more reasonable to expect of them to strive to obtain the goods they need--ones Sterba calls, in a question-begging fashion, surplus wealth. (As if someone is justified in identifying what constitutes surplus--a term from classical Marxism that makes no sense outside the Marxist framework.)

If one recognizes, however, that an individual's life is his or her own and he or she does not belong to anything or anyone outside of memberships to which he or she consents, then even the most dire needs of others does not support any institutional arrangement that fails to recognize individual rights--to life, liberty, and, yes, property (that one comes by without violating the rights of others even if one does not strictly deserve the property for some kind of service rendered or other achievement--for instance, come by because others want to purchase some talent or other attribute one naturally has). Just as it is unjustified to use others as a shield against natural danger, regardless of how little use one may make of them, one may not use others against their will, including wealth they own. One must find ways around this prohibition, as indeed most do when they engage in trade rather than theft in the effort to acquire their own wealth.

It is reasonable to demand this of everyone, even those in dire straits. If, however, in desperate circumstances such people do not honor this prohibition, there can be some measure of forgiveness, even within the purview of the legal authority (as per some cases that have been subject to unusual judicial discretion). But such exceptions, as hard cases in general, make bad general law.

Law and Common Sense

Let me go back to where we started. When somebody robs another who resists, the latter has a common sense idea of doing the right thing, that the resistance is not merely some immature, capricious and willful conduct. It is not as if one were simply engaged in feet stomping and crying, "I want it! I want it! I want it!" No, one senses that there is right on one's side, not just an arbitrary wish and desire.

That is one reason it is vital to consider whether the free system can be given justification. What has been said here is by no means a thorough defense of the right to private property, but it does furnish some hints as to how such a defense would have to be presented if the issue ever arises, which is quite often in our world. First, this right, if protected, preserves one's moral agency in this natural world in which community life occurs. Furthermore, it punctuates the fact that striving to prosper is a morally valid goal for human beings. So, the moral virtue of prudence, of taking the requisite actions to care for oneself and one's intimates, supports the right to private property as well.

One thing that respect and protection of private property rights makes possible is the pursuit of wealth. Oddly, however, that is a *criticism* many offer against the system of free market capitalism that is built on the legal infrastructure of private property rights. They say, as we have already seen Marx do so, that private property rights--if they are protected, maintained, developed as law--encourage a hedonistic, narrowly selfish life, one that is concerned exclusively with acquisition of worldly goods. As he said, "the right of man to property is the ? right of selfishness." Freedom is supposed to make too much self-indulgence, including pleasure, possible.

So another question that arises here turns out to be, "Is pleasure justified?" For even if the right to private property could be used for purposes quite different from obtaining pleasure in life, if pleasure is something loathsome and this right somehow encourages its relentless pursuit, perhaps it is an institution that is much more harmful than benign.

We cannot enter this topic at length but this much should suffice for now. If we are indeed natural beings in this world, one of our important values will be pleasure, the good feelings we experience *via* our bodies. This is so even if there are higher goods the attainment of which may require giving up some

pleasure.

So, now, if wealth brings with it the possibility of pleasure, then wealth itself is a worthy good, provided it is not stolen but created, produced, and that it is not chosen as the highest good if a higher one can also be identified.

Abandon the Divided Self Idea

If one has a completely different view of human nature, whereby only the spiritual side of human life is of significance, then one will embrace a different system of values and probably also champion different institutions. We have a powerful tradition in most civilizations whereby there is an uneasiness about facilitating the flourishing of the human body. And that is often what stands, at a most basic level, against the free society!

One reason underlying that stand is the lack of a clear, unambiguous and benign acceptance of our earthly selves. We often think ourselves to be so unique, so extraordinary that we believe we must be partly divine or otherworldly. St. Augustine said it well when he cried out, "How great, my God, is this force of memory, how exceedingly great! It is like a vast and boundless subterranean shrine....Yet this is a faculty of my mind and belongs to my nature; nor can I myself grasp all that I am. Therefore the mind is not large enough to contain itself. But where can that uncontained part of it be?"[(14)] And he then answered, as have millions of others, that it must be somewhere apart from nature.

Business, too, has a bad reputation because of this, as well as the free market place, because if our natural selves are somehow inferior, than servicing it with the vigor with which people in business do must be misguided. People who pursue profit or material wealth, would then be pursuing trivia. They would be mere hedonists. As the title of one of my articles put it, "Praise Mother Teresa and then Hit the Shopping Malls." In other words, we live a schizophrenic life. We embrace the value of prosperity, economic success, wealth on the one hand but then we deny it on the other.

Yet, if in our lives we embrace our bodies, minds, emotions, sensations and so on, then we suggest by this that a more integrated view of how to live and how to protect our values is right, not one that tears us into warring pieces.

The private property rights system rests, in part, on such an integrated understanding of human life, not the schizophrenic one. It rejects the idea that each human being is divided, a view that much of our literature embraces. It places us squarely on this earth, even though it is by no means hostile to anyone who chooses to look elsewhere for fulfillment, quite the contrary. (Indeed, the right to private property has made religious pursuits extremely fruitful as well as abundant, especially in the United States of America where churches can purchase their own land and welcome parishioners where they will not be disrupted by their foes.

The divided self idea started with Plato, at least with a certain reading of him, where he takes our minds to be divided from our bodies and where the mind is supposed to hold the rest of ourselves in check, rule it firmly. Major writers, especially theologians, have ever since stressed this drama and it is reflected in our society's institutions. Victor Hugo made note of this point:

On the day when Christianity said to man: You are a duality, you are composed of two beings, one

perishable, the other immortal, one carnal, the other ethereal, one enchained by appetites, needs, and passions, the other lofted on wings of enthusiasm and reverie, the former bending forever to earth, its mother, the latter soaring always toward heaven, its fatherland--on that day, the drama was created. Is it anything other, in fact, than this contrast on every day, this battle at every moment, between two opposing principles that are ever-present in life and that contend over man from the cradle to the grave?[(15)]

As a result of this, sadly, we are often apologetic for pursuing a satisfactory, happy life here on earth. And then we find it difficult if not impossible to defend the political regime that most clearly enhances such a life, having to accept it when others maintain that, well, it is a mundane, materialist life that such a regime supports.

All of this must be seriously rethought. Without it the best socioeconomic system human beings have ever identified will fail to flourish.

Endnotes:

1. Randy Barnett prefers the term "the right to several property" in *The Structure of Liberty* (London: Oxford University Press, 1998). One reason that it is useful, at least in the context of political philosophy and moral theory, to keep with the terminology of "the right to private property" is that this right is tied to an important element of classic liberal social and political thought, namely, individualism.

2. This is what public choice theory, within contemporary political economy, has helped identify. See, however, Harold Kincaid**,** *Philosophical Foundations of the Social Sciences***:** Analyzing Controversies in Social Research (London: Cambridge University Press, 1996), in which the author argues that the individualist stance in modern economics is mistaken and that we ought to deploy a more holistic approach. Kincaid and many other critics of what they dub "liberal individualism" claim that individualism is atomistic. While some may, certainly not all individualist fit this description. Nor is that the only version of individualism that gives rise to liberal politics. A good case in point is John Locke, among the early liberals, and many others such as Ayn Rand, Eric Mack, Douglas B. Rasmussen, Douglas J. Den Uyl, Fred D. Miller, Jr., and the late David L. Norton, in our own age.

3. Exceptions are individuals crucially incapacitated. Political theory and law are not devices for dealing with exceptions, however.

4. I develop much of this throughout Tibor R. Machan, *Classical Individualism, The Supreme Importance of Each Human Being* (London: Routledge, 1998), especially in Chapter 13. "Individualism and Political Dialogue." Any kind of professional, including scholarly and intellectual, malpractice alleged in the course of political or other disputes implicitly rests responsibility with the interlocutors, blaming or commanding them for what they ought to or ought not to have done or said.

5. For more on this, see Edward Pols, *Acts of Our Being* (Boston, MA: University of Massachusetts Press, 1982) and Tibor R. Machan, *Initiative: Human Agency and Society* (Stanford, CA: Hoover Institution Press, 2000).

6. "To [Aristotle] the Individual is the primary reality, and has the first claim to recognition. In his metaphysics individual things are regarded, not as the mere shadows of the idea, but as independent

realities; universal conceptions not as independent substances but as the expression for the common peculiarity of a number of individuals. Similarly in his moral philosophy he transfers the ultimate end of human action and social institutions from the State to the individual, and looks for its attainment in his free self-development. The highest aim of the State consists in the happiness of its citizens."[6]. Eduard Zeller, *Aristotle and the Earlier Peripatetics*, trans. B. F. C. Costelloe and J. H. Muirhead (London: Oxford University Press, 1897), pp. 224-26. This idea is developed further in Fred D. Miller, Jr., *Nature, Justice, and Rights in Aristotle's* Politics (Oxford: Clarendon Press, 1995). The difference between the atomistic and classical type of individualism is discussed in Tibor R. Machan, *Capitalism and Individualism, Reframing the Argument for the Free Society* (New York: St. Martin's Press, 1990).

[7].A very important beginning had been made on this line of analysis by William of Ockham who regarded property rights as securing "the power of rights reason," that is, a sphere of personal jurisdiction that made reasoning about what one ought to do possible. This was extended more elaborate in John Locke's idea that one has the right to one's person and estate, something that, if protected, makes choice among other persons possible. An even greater advance on the precise identification of the nature of private property had been made in James Sadowsky, "Private Property and Collective Ownership," in Tibor R. Machan, *The Libertarian Alternative* (Chicago: Nelson Hall, 1974). Karl Marx, too, got it nearly right when he wrote that "the right of man to property is the right to enjoy his possessions and dispose of the same arbitrarily without regard for other men, independently, from society, the right of selfishness." Karl Marx, "On The Jewish Question," in Robert C. Trucker, ed., *The Marx-Engels Reader* (New York: W. W. Norton, 1978), p. 26. Only, Marx's warped view of human nature prompted him to consider only the most wasteful and pointless way the right to private property might be exercised.

[11]. The concept "belong" can be used to refer to membership as well as to being a part of. Membership in human communities embarking on various purposes can be voluntary but being a part of is something ontologically pregnant ? one is part of something sometimes whether one likes it or not. Taylor seems clearly to mean by "belong" "being part of," so that one can be compelled to adhere to the purpose at hand.

The Internet Encyclopedia of Philosophy

Prodicus (fl. 5th Cn. BCE.)

Prodicus was a sophist and rhetorician from Iulis on the island of Ceos. He was contemporary with Democritus and Gorgias, and was a disciple of Protagoras. He flourished in the 86th Olympiad, and it is reported that his disciples included Socrates, Euripides, Theramenes, and Isocrates. His countrymen, after giving him several public jobs, sent him as ambassador to Athens. He was so well received there that he was induced to open a school of rhetoric. In his lectures on literary style he laid stress on the right use of words and the accurate discrimination between synonyms. Plato frequently satirizes him as a pedantic lecturer on the niceties of language. Plato also insinuates that the prospect of wealth prompted Prodicus to open his school, and indeed his lectures seem to have brought him much money. Philostratus also notes that Prodicus was fond of money. He used to go from one city to another displaying his eloquence, and, though he did it in a mercenary way, he nevertheless had great honors paid to him in Thebes and Lacedaemon. His charge to a pupil was fifty drachmae. Aristophanes, however, describes him as the most remarkable of the natural philosophers for wisdom and character. It is reported that people flocked to hear Prodicus, although he had an unpleasant sounding voice. It also related that Xenophon, when a prisoner in Boeotia, desiring to hear Prodicus, came up with the required bail and went and gratified his curiosity (*Philostr. l. c.*). None of his lectures has come down to us in its original form. His most famous work is *The Choice of Hercules*, and was frequently cited. The original is lost, but the substance of it is in Xenophon's *Memorabilia* (2:1:21). Prodicus was put to death by the Athenians on the charge of corrupting their youth. Sextus Empiricus ranks him among the atheists, and Cicero remarks that some of his doctrines were subversive of all religion. It is said that he explained the origin of religion by the personification of natural objects.

IEP

Protagoras (480-411 BCE.)

Protagoras is the earliest known sophist of ancient Greece. He was born at Abdera, in Thrace, probably about 480 BCE. It is said that Protagoras was once a poor porter carrying large bundles of wood on his shoulders. He attracted the attention of Democritus who took a liking toward him and instructed him in philosophy (Diog. Laert. ix. 53; x. 8; Gell. v. 3). This well-known story, however, appears to have arisen from the statement of Aristotle that Protagoras invented a sort of porter's knot for the more convenient carrying of burdens. In addition to this, Protagoras was about twenty years older than Democritus. Protagoras was the first who called himself a Sophist, and taught for pay; and he practiced his profession for forty years. Pericles debated moral problems with him, and he was employed to draw up a code of laws for the Athenian colony of Thurii in 445 BCE. Thus he arrived in Athens at least by that year. We are not informed about whether he accompanied the colonists to Thurii, but at the time of the plague (430) we find him again in Athens. Between his first and second visit to Athens he had spent some time in Sicily, where he had acquired fame. He brought with him to Athens many admirers from other Greek cities through which he had passed. His instructions were so highly valued that he sometimes received 100 minae from a pupil; Plato says that Protagoras made more money than Phidias and ten other sculptors.

Protagoras wrote a large number of works, of which the most important were entitled *Truth* (*Alethia*) and *On the Gods* (*Peritheon*). The first contained the theory refuted by Plato in the *Theaetetus*. In 411 he was accused of impiety by Pythodorus, one of the Four Hundred. The charges were based on his book *On the Gods*, which began with the statement, "Respecting the gods, I am unable to know whether they exist or do not exist" (Diog. Laert. ix. 52). The impeachment was followed by his banishment, or, as others affirm, only by the burning of his book. His doctrine was, in fact, a sort of agnosticism based upon the impossibility of attaining any absolute criterion of truth. Plato gives a vivid picture of the teaching of Protagoras in the dialogue that bears his name. Protagoras was especially celebrated for his skill in the rhetorical art. By way of practice in the art he was accustomed to make his pupils discuss theses (*communes loci*), an exercise which is also recommended by Cicero. He also directed his attention to language, and tried to explain difficult passages in the poets. He is said to have been the first to make the grammatical distinctions of moods in verse and of genders in nouns. Protagoras died about 411 at the age of nearly seventy years, when he was lost at sea on his way to Sicily.

Protagoras was the author of the famous saying, "Man is the measure of all things; of what is, that it is; of what is not, that it is not." This saying puts in a nutshell the whole teaching of Protagoras. Indeed, it contains the essence of the entire thought of the sophists. By "man" he did not mean humankind at large. He meant the individual person. By "measure of all things," he meant the standard of the truth of all things. Each individual person is the standard of what is true to himself. There is no truth except the sensations and impressions of each person. The earlier Greek philosophers made a clear distinction between sense and thought, between perception and reason,

and had believed that the truth is to be found, not by the senses, but by reason. The teaching of Protagoras rests on denying this distinction.

Samuel von Pufendorf (1632-1694),

LIFE. Pufendorf, son of a Lutheran clergyman, was educated in theology and mathematics, and later turned to the study of moral and political theory. He was especially influenced by Grotius (who he credits with being the originator of the theory of natural law) and Hobbes. He briefly appointed as tutor to the son of the Swedish ambassador in Denmark. A war between the two countries resulted in Pufendorf's imprisonment for six months. Without any reading material at his disposal, he reflected on what he remembered from Grotius and Hobbes, and wrote his booklet Elementa Jurisprudentiae Universalis. He was appointed professor of the law of nature and nations at the University of Heidelberg in 1670, during which time he composed his greatest work, Of the Law of Nature and Nations (De Jure Naturae et Gentium, 1762). In this work Pufendorf argues that individual humans are vulnerable, and we must live in society to survive. Accordingly, God, as our creator, wills that we should be sociable, and this becomes the highest natural law. Our moral duties arise from this mandate and, in turn, these moral duties lead to civil and international laws. The next year Pufendorf published a shorter and more popular account of his theory in The Duty of Man and Citizen according to Natural Law (De Jure Naturae et Gentium, 1673). Lutheran theologians attacked Pufendorf's theory, particularly his contention that natural law originates from God's will (as opposed to God's reason). Pufendorf defended himself against the attacks and published a collection of his correspondences on the issue. In 1677 he was appointed court historian for the King of Stockholm and wrote a 33 volume history of Sweden. He was later employed as an historian for the Elector of Brandenburg in 1688, the result of which was a 19 volume history of the Elector's life and reign.

NATURAL LAW. Like natural law theorists before him, Pufendorf distinguishes between divine and human law, both of which govern human conduct. Divine is created by God, and human law is created by governments. Pufendorf also distinguishes between natural law and positive law. Natural laws are fixed dictates which are necessary for a peaceful society. Positive law, by contrast, arises from the mere pleasure of the legislator. The foundation of natural law, for Pufendorf, arises from (1) our need to live in society, and (2) our otherwise unsociable inclinations which need to be regulated. Knowledge of natural law comes from our knowledge of human nature. The principle aspect of human nature which is the source of natural law is our instinctive drive for self-preservation. We are at the mercy of society for our self-preservation, and without society no human could survive. In spite of our dependence on society, we have many characteristics which make us unsociable. Compared to the rest of the animal kingdom, we are more lustful, vain in our dress, and competitive. Our individual preferences differ, thus making us more difficult for us to get along with each other. For Pufendorf, the fundamental law of nature follows from the above discussion of the importance of self-preservation through society. In short, we need to promote society, and all actions which universally serve this end are mandated. To attain the status of "laws" Pufendorf believes that these rules must be both authored by God and commanded by him. In short, "law" implies a lawgiver. Pufendorf acknowledges that these laws have a certain human

utility, or usefulness, but that the authority of these laws goes beyond utility and rests in God. The sense of religion which humans have confirms that God is the source of the natural law. Suppose, however, that we could physiologically change human nature so that, from birth, we could live independently from society. For Pufendorf, this would have no bearing on the content of natural law as commanded by God. Not only does God command these laws, but he gives us a natural knowledge of them which we acquire in the normal course of child development.

FORMATION OF SOCIETIES AND GOVERNMENTS. Knowledge of the natural law - that is, the mandate to be sociable - entails three groups of duties: duties to God, to oneself, and to others. Our duties to others, such as the duty to avoid injuring others, are an immediate consequence of the mandate to be sociable. The duties to God, such as worship, follow more indirectly from the mandate to be sociable. Our primary motive to be sociable is fear of God; we recognize, then, our duties to God. The source of our duties to ourselves arises both from our duties to God and our duties to ourselves. After listing our various duties to God, ourselves, and others, Pufendorf explains the necessity in forming large communities of people to protect us from each other. Pufendorf believes that human nature requires that we live in some kinds of societies, such as family units, and certain duties arise from this. However, human nature alone does not require that we live in large communities. The reason we do so is only because of the special benefits that we receive. Pufendorf lists three areas of disadvantage when opting to live in a large community: loss of liberty; abandonment of private good for public good; and conflict with natural inclinations. Given the above disadvantages, what, then, are the advantages of living in large communities? The single advantage is protection from other people. Even though people have an instinctive knowledge of the natural law and its prescribed duties to others, many of us will still harm others. For Pufendorf, the formation of a large community, with an effective government is the only way to motivate people to not harm others. Indeed, the civil government is even more effective in restraining people than is fear of punishment from God. Pufendorf explains why civil governments are more effective in restraining harmful conduct than either fear of punishment from God or conscience. As divine punishment, this is slow to occur, whereas punishment from civil government is immediate. As to conscience, this is too weak of a motivating factor. Given the fact that punishment from God is slow to occur, we sometimes mistake divine punishment for natural events. For Pufendorf, only a community of a considerable number of people will offer effective protection against harm from others, especially from those outside the community. The people in the community must form an initial covenant indicating who is included, and they cannot break this covenant when it suits their private advantage. After that, they must construct a constitution which establishes a ruling government. For, the wills of people in this community are best united in one person, or one assembly. The function of the government is to promote safety, and citizens are under the authority of this government. Such governments are indeed willed by God since (a) God ordains natural law, and (b) civil governments are the only way of creating an environment for us to follow natural law.

Pyrrho (c. 360-c.270 BCE.)

Pyrrho was a Greek philosopher from Elea, and founder of the Greek school of skepticism. In his youth he practiced the art of painting, but passed over this for philosophy. He studied the writings of Democritus, became a disciple of Bryson, the son of Stilpo, and later a disciple of Anaxarchus. He took part in the Indian expedition of Alexander the Great, and met with philosophers of the Indus region. Back in Greece he was frustrated with the assertions of the Dogmatists (those who claimed to possess knowledge), and founded a new school in which he taught that every object of human knowledge involves uncertainty. Thus, he argued, it is impossible ever to arrive at the knowledge of truth (*Diog. Laert,* 58). It is related that he acted on his own principles, and carried his skepticism to such an extreme, that his friends were obliged to accompany him wherever he went, so he might not be run over by carriages or fall down precipices. It is likely, though, that these reports were invented by the Dogmatists whom he opposed. He spent a great part of his life in solitude, and was undisturbed by fear, or joy, or grief. He withstood bodily pain, and when in danger showed no sign of apprehension. In disputes he was known for his subtlety. Epicurus, though no friend to skepticism, admired Pyrrho because he recommended and practiced the kind of self-control that fostered tranquillity; this, for Epicurus, was the end of all physical and moral science. Pyrrho was so highly valued by his countrymen that they honored him with the office of chief priest and, out of respect for him, passed a decree by which all philosophers were made immune from taxation. He was an admirer of poets, particularly Homer, and frequently cited passages from his poems. After his death, the Athenians honored his memory with a statue, and a monument to him was erected in his own country.

Pyrrho left no writings, and we owe our knowledge of his thoughts to his disciple Timon of Phlius. His philosophy, in common with all post-Aristotelian systems, is purely practical in its outlook. Skepticism is not posited on account of its speculative interest, but only because Pyrrho sees in it the road to happiness, and the escape from the calamities of life. The proper course of the sage, said Pyrrho, is to ask himself three questions. Firstly we must ask what things are and how they are constituted. Secondly, we ask how we are related to these things. Thirdly, we ask what ought to be our attitude towards them. As to what things are, we can only answer that we know nothing. We only know how things appear to us, but of their inner substance we are ignorant. The same thing appears differently to different people, and therefore it is impossible to know which opinion is right. The diversity of opinion among the wise, as well as among the vulgar, proves this. To every assertion the contradictory assertion can be opposed with equally good grounds, and whatever my opinion, the contrary opinion is believed by somebody else who is quite as clever and competent to judge as I am. Opinion we may have, but certainty and knowledge are impossible. Hence our attitude to things (the third question), ought to be complete suspense of judgment. We can be certain of nothing, not even of the most trivial assertions. Therefore we ought never to make any positive statements on any subject. And the Pyrrhonists were careful to import an element of doubt even into the most trifling assertions which they might make in the course of their daily life. They

did not say, "it is so," but "it seems so," or "it appears so to me." Every observation would be prefixed with a "perhaps," or "it may be."

This absence of certainty applies as much to practical as to theoretical matters. Nothing is in itself true or false. It only appears so. In the same way, nothing is in itself good or evil. It is only opinion, custom, law, which makes it so. When the sage realizes this, he will cease to prefer one course of action to another, and the result will be apathy (*ataraxia*). All action is the result of preference, and preference is the belief that one thing is better than another. If I go to the north, it is because, for one reason or another, I believe that it is better than going to the south. Suppress this belief, learn that the one is not in reality better than the other, but only appears so, and one would go in no direction at all. Complete suppression of opinion would mean complete suppression of action, and it was at this that Pyrrho aimed. To have no opinions was the skeptical maxim, because in practice it meant apathy, total quietism. All action is founded on belief, and all belief is delusion, hence the absence of all activity is the ideal of the sage. In this apathy he will renounce all desires, for desire is the opinion that one thing is better than another. He will live in complete repose, in undisturbed tranquillity of soul, free from all delusions. Unhappiness is the result of not attaining what one desires, or of losing it when attained. The wise person, being free from desires, is free from unhappiness. He knows that, though people struggle and fight for what they desire, vainly supposing some things better than others, such activity is but a futile struggle about nothing, for all things are equally indifferent, and nothing matters. Between health and sickness, life and death, difference there is none. Yet insofar as we are compelled to act, we will follow probability, opinion, custom, and law, but without any belief in the essential validity or truth of these criteria.

Pythagoras (fl. 530 BCE.)

Pythagoras (fl. 530 BCE) must have been one of the world's greatest men, but he wrote nothing, and it is hard to say how much of the doctrine we know as Pythagorean is due to the founder of the society and how much is later development. It is also hard to say how much of what we are told about the life of Pythagoras is trustworthy; for a mass of legend gathered around his name at an early date. Sometimes he is represented as a man of science, and sometimes as a preacher of mystic doctrines, and we might be tempted to regard one or other of those characters as alone historical. The truth is that there is no need to reject either of the traditional views. The union of mathematical genius and mysticism is commonly enough. Originally from Samos, Pythagoras founded at Kroton (in southern Italy) a society which was at once a religious community and a scientific school. Such a body was bound to excite jealousy and mistrust, and we hear of many struggles. Pythagoras himself had to flee from Kroton to Metapontion, where he died.

It is stated that he was a disciple of Anaximander, his astronomy was the natural development of Anaximander's. Also, the way in which the Pythagorean geometry developed also bears witness to its descent from that of Miletos. The great problem at this date was the duplication of the square, a problem which gave rise to the theorem of the square on the hypotenuse, commonly known still as the Pythagorean proposition (Euclid, I. 47). If we were right in assuming that Thales worked with the old 3:4:5 triangle, the connection is obvious.

Pythagoras argued that there are three kinds of men, just as there are three classes of strangers who come to the Olympic Games. The lowest consists of those who come to buy and sell, and next above them are those who come to compete. Best of all are those who simply come to look on. Men may be classified accordingly as lovers of wisdom, lovers of honor, and lovers of gain. That seems to imply the doctrine of the tripartite soul, which is also attributed to the early Pythagoreans on good authority, though it is common now to ascribe it to Plato. There are, however, clear references to it before his time, and it agrees much better with the general outlook of the Pythagoreans. The comparison of human life to a gathering like the Games was often repeated in later days. Pythagoras also taught the doctrine of Rebirth or transmigration, which we may have learned from the contemporary Orphics. Xenophanes made fun of him for pretending to recognize the voice of a departed friend in the howls of a beaten dog. Empedocles seems to be referring to him when he speaks of a man who could remember what happened ten or twenty generations before. It was on this that the doctrine of Recollection, which plays so great a part in Plato, was based. The things we perceive with the senses, Plato argues, remind us of things we knew when the soul was out of the body and could perceive reality directly.

There is more difficulty about the cosmology of Pythagoras. Hardly any school ever professed such reverence for its founder's authority as the Pythagoreans. 'The Master said so' was their watchword. On the other hand, few schools have shown so much capacity for progress and for adapting themselves to new conditions. Pythagoras started from the cosmical system of

Anaximenes. Aristotle tells us that the Pythagoreans represented the world as inhaling 'air' form the boundless mass outside it, and this 'air' is identified with 'the unlimited'. When, however, we come to the process by which things are developed out of the 'unlimited', we observe a great change. We hear nothing more of 'separating out' or even of rarefaction and condensation. Instead of that we have the theory that what gives form to the Unlimited is the Limit. That is the great contribution of Pythagoras to philosophy, and we must try to understand it. Now the function of the Limit is usually illustrated from the arts of music and medicine, and we have seen how important these two arts were for Pythagoreans, so it is natural to infer that the key to its meaning is to be found in them.

It may be taken as certain that Pythagoras himself discovered the numerical ratios which determine the concordant intervals of the musical scale. Similar to musical intervals, in medicine there are opposites, such as the hot and the cold, the wet and the dry, and it is the business of the physician to produce a proper 'blend' of these in the human body. In a well-known passage of Plato's Phaedo (86 b) we are told by Simmias that the Pythagoreans held the body to be strung like an instrument to a certain pitch, hot and cold, wet and dry taking the place of high and low in music. Musical tuning and health are alike means arising from the application of Limit to the Unlimited. It was natural for Pythagoras to look for something of the same kind in the world at large. Briefly stated, the doctrine of Pythagoras was that all things are numbers. In certain fundamental cases, the early Pythagoreans represented numbers and explained their properties by means of dots arranged in certain 'figures' or patterns.

Continental Rationalism

The term "Continental Rationalism" traditionally refers to a 17th century philosophical movement begun by Descartes. After Descartes, several dozen scientists and philosophers continued his t eachings throughout continental Europe and, accordingly were titled "Cartesians." Some Cartesians strayed little from Descartes' scientific and metaphysical theories. Others incorporated his theories into Calvinistic theology. But a handful of philosopher s influenced by Descartes were more original in developing their own views and these people are included under the more general title "rationalists." the principle rationalists include Benedict Spinoza , Nicholas Malebranche, Gottfried Willhelm Leibniz, and Christian Wolff.

Continental Rationalism is usually understood in relation to its rival 17th century movement, British Empiricism, founded by John Locke. The radical division between these two schools was fir st articulated by Thomas Reid in his *Inquiry Concerning the Human Mind*; Reid's division was taken as the definitive explanation, which has come down to the present time. Two key points distinguish Rationalism from British Empiricists. The first inv olves differing theories about the origin of ideas. Rationalists believed that an important group of foundational concepts are known intuitively through reason, as opposed to experience. Descartes describes such concepts as innate ideas, the most importan t of these including the ideas of oneself, infinite perfection, and causality. British Empiricists, as we will see, staunchly rejected this view, and argued that all ideas trace ultimately trace back to experiences, such as sense perceptions and emotions. The second distinguishing feature between Rationalism and Empiricism concerns their differing methods of investigating problems. Rationalists maintained that we could deduce truths with absolute certainty from our innate ideas, much the way theorems in g eometry are deduced from axioms. Mathematical demonstration was seen as the perfect type of demonstrating truth and, accordingly, mathematical proof became the model for all other kinds of demonstration. Although empiricists also used deductive reasoning, they put a greater emphasis on the inductive method championed by fellow British countryman Francis Bacon.

Contemporary historians of philosophy challenge this traditional distinction between rationalism and empiricism. Louis Loeb, for example, argues for an alternative classification of 17th and 18th century philosophers which is more representative of t he actual content of their metaphysical and epistemological positions. In spite of Loeb's suggestions, the traditional division between rationalism and empiricism offered by Reid has at least some foundation, and is convenient for understanding the evolut ion of philosophical theories during the modern period of philosophy.

Hans Reichenbach (1891-1953)

Life. Hans Reichenbach, born on September 26th 1891 in Hamburg, Germany, was a leading philosopher of science, a founder of the Berlin circle, and a proponent of logical positivism (also known as neopositivism or logical empiricism). He studied physics, mathematics and philosophy at Berlin, Erlangen, Gottingen and Munich in 1910s. Among his teachers were the neo-Kantian philosopher Ernst Cassirer, the mathematician David Hilbert, and the physicists Max Planck, Max Born and Albert Einstein. Reichenbach received his degree in philosophy from the University at Erlangen in 1915; his dissertation on the theory of probability was published in 1916. He attended Einstein's lectures on the theory of relativity at Berlin in 1917-20; at that time Reichenbach chose the theory of relativity as the first subject for his own philosophical research. He became a professor at Polytechnic at Stuttgart in 1920. In the same year he published his first book on the philosophical implications of the theory of relativity, *The theory of relativity and a priori knowledge*, in which Reichenbach criticized Kantian theory of synthetic a priori. In the following years he published three books on the philosophical meaning of the theory of relativity: *Axiomatization of the theory of relativity* (1924), *From Copernicus to Einstein* (1927) and *The philosophy of space and time* (1928); the last in a sense states logical positivism's view on the theory of relativity. In 1926 Reichenbach became a professor of philosophy of physics at the University at Berlin. His methods of teaching philosophy were something of a novelty; students found him easy to approach (this fact was uncommon in German universities); his courses were open to discussion and debate. In 1928 he founded the Berlin circle (named Die Gesellschaft fur empirische Philosophie, "Society for empirical philosophy"). Among the members of the Berlin circle were Carl Gustav Hempel, Richard von Mises, David Hilbert and Kurt Grelling. In 1930 Reichenbach and Carnap undertook the editorship of the journal *Erkenntnis* ("Knowledge").

In 1933 Adolf Hitler became Chancellor of Germany. In the same year Reichenbach emigrated to Turkey, where he became chief of the Department of Philosophy at the University at Istanbul. In Turkey Reichenbach promoted a shift in philosophy course; he introduced interdisciplinary seminars and courses on scientific subjects. In 1935 he published *The theory of probability*.

In 1938 he moved to the United States, where he became a professor at the University of California at Los Angeles; in the same year was published *Experience and prediction*. Reichenbach's work on quantum mechanics was published in 1944 (*Philosophic foundations of quantum mechanics*). Afterwards he wrote two popular books: *Elements of symbolic logic* (1947) and *The rise of scientific philosophy* (1951). In 1949 he contributed an essay on *The philosophical significance of the theory of relativity* to *Albert Einstein: philosopher-scientist* edit by Paul Arthur Schillp. Reichenbach died on April 9th 1953 at Los Angeles, California, while he was working on the philosophy of time. Two books *Nomological statements and admissible operations* (1954) and *The direction of time* (1956) were published posthumously.

The philosophy of space and time. The philosophical meaning of the theory of relativity.

Space. Euclidean geometry is based on the set of axioms stated by Greek mathematician Euclid who developed geometry into an axiomatic system, in which every theorem is derivable from the axioms. Euclid's work revealed that the truth of geometry depends on the truth of axioms and therefore the question arose whether the axioms were true. Many Euclidean axioms were self-evident, but the axiom of parallels, which states that there is one and only one parallel to a given line through a given point, was considered not self-evident, and many mathematicians tried to derive it from the other axioms. Eventually it was proved the axiom of parallels is not a logical consequence of the remainder. As a result of this research non-Euclidean geometries were discovered and mathematicians became aware of the existence of a plurality of geometries, namely:

- Euclidean geometry, in which the axiom of parallels is true;
- geometry of Bolyai and Lobachevsky, also known as hyperbolic geometry, in which there is an infinite number of parallels to the given line through the given point (Janos Bolyai b 1802 d 1860, Hungarian mathematician, published in 1832 the first account of a non-Euclidean geometry; Nikolay Lobachevsky b 1793 d 1856, Russian mathematician, independently discovered hyperbolic geometry);
- elliptical geometry, in which there exist no parallel.

In Reichenbach opinion, it must be realized that there are two different kinds of geometry, namely mathematical geometry and physical geometry. Mathematical geometry, a branch of mathematics, is a purely formal system and it does not deal with the truth of axioms, but with the proof of theorems, ie it only search for the consequences of axioms. Physical geometry is concerned with the real geometry, ie the geometry which is true in our physical world: it searches for the truth (or falsity) of axioms, using the methods of empirical science: experiments, measurements, etc; it is a branch of physics.

How can physicists discover the geometry of the real world? Look at the following example, which Reichenbach analyses in *The philosophy of space and time*. Two-dimensional intelligent beings live in a two-dimensional world, on the surface of a sphere, but they do not know where they live; in their opinion, they might live on a plane, a sphere or whatever surface. How can they discover where they live? They could use some mathematical properties that characterize a geometry; for example, in Euclidean geometry the ratio of the circumference of a circle to its diameter equals pi (3.14...) while in elliptical geometry the ratio is variable and it is less than pi; also in hyperbolic geometry the ratio is variable but greater than pi. Therefore they could measure the circumference and the diameter of a circle; if the ratio equals pi the surface is a plane; if the ratio is less than pi the surface is a sphere. Thus they could discover where they live with the help of such measurements. This method, invented by Gauss (Karl Friedrich Gauss, b 1777 d 1855, German mathematician, was the first to discover a non-Euclidean geometry although he did not published his work) is suitable for a two-dimensional world. Riemann (Bernhard Riemann, b 1826 d 1866, German mathematician, developed both the elliptical geometry and the generalized theory of metric space in any number of dimension which Einstein used in his general theory of relativity) invented a method suitable for a three-dimensional world. There is no reason in principle why physicists could not use Riemann's method to discover the geometry of our world.

Riemann's method is based on physical measurements. Reichenbach carefully examines the epistemological implications of measuring geometrical entities. The empirical measurement of geometrical entities depends on physical objects or physical processes corresponding to geometrical concepts. The process of establishing such correlation is called a *co-ordinative definition*. Usually, a

definition is a statement that gives the exact meaning of a concept; this kind of definition is called an explicit definition. There is another kind of definition, namely the co-ordinative definition; it is not a statement, but an ostensive definition. The co-ordinative definition of a concept is a correlation between a real object or a physical process and the concept itself. Some geometrical entities cannot be defined by an explicit definition but they require a co-ordinative definition. For example, the unit of length, ie the metre, is defined by a co-ordinative definition; the physical object corresponding to the metre is the standard rod in Paris (Museum of weights and measures in Paris houses the units of measure for International System of Units). Another example is the definition of straight line which is co-ordinated with a physical process, namely the path of a light ray.

What is the philosophical meaning of a co-ordinative definition? Reichenbach proposes the following problem, discussed in *The philosophy of space and time*. A measuring rod is moved from one point of space (say A) to another point (say B). When the measuring rod is in B, is its length altered? Many physical circumstances can alter the length, eg if temperature in A differs from temperature in B. In this example, we can discover whether the temperature is the same by means of a metallic rod and a wooden rod which are of equal length when they are in A. Move the two rods to B: if their length becomes different then the temperature is also different, otherwise the temperature is the same. This method is suitable because temperature is a *differential force*, ie a force that produces different effects on different substances. But there are *universal forces*, which produce the same effect on all type of matter. The best known universal force is gravity: its effect is the same on all bodies and therefore all bodies fall with the same acceleration. Now suppose a universal force alters the length of the measuring rods when they are moved from A to B; in this instance, we do not observe any difference between the measuring rods and we cannot know whether the length is altered. Consequently, if a rod stays in A and the other is moved to B where a universal force alters its length, we cannot know their length is different. So we must acknowledge that there is not any way of knowing whether the length of two measuring rods, which are equal when they are in the same point of space, is the same when the two rods are in two different points of space. We can define the two rods equal in length if all differential forces are eliminated and disregard universal forces. But we can adopt a different definition, of course. Thus we must accept - Reichenbach says - that *the geometrical form of a body is not an absolute fact, but depends on a co-ordinative definition*. There is an astonish consequence of this fact. If a geometry G was proved to be the real geometry by a set of measurements, we could arbitrarily choose a different geometry G' and adopt a different set of co-ordinative definitions so that G' would become the real geometry. This is the *principle of relativity of geometry*, which Reichenbach examines, from a mathematical point of view, in *Axiomatization of the theory of relativity* and, from a philosophical point of view, in *The philosophy of space and time*. This principle states that all geometrical systems are equivalent; it falsifies alleged a priori character of Euclidean geometry and thus it falsifies the Kantian philosophy of space too.

At a first glance, the principle of relativity of geometry proves it is not possible to discover the real geometry of our world. This is true if we limit ourselves to metric relationships. Metric relationships are geometric properties of bodies depending on distances, angles, areas, etc; examples of metric relationships are "the ratio of circumference to diameter equals pi" and "the volume of A is greater than the volume of B". But we can study not only distances, angles, areas but also the order of space, the *topology* of space, ie way in which the points of space are placed in relation to one another; an example of a topological relationship is "point A is between point B and C". A consequence of the principle of relativity of geometry is, for instance, that a plane and a sphere are equivalent with respect to metric. From a topological point of view, a sphere and a plane are not equivalent (in topology, two geometrical

objects are equivalent if and only if there is a continuous transformation that assign to every point of the first object a unique point of the second and vice versa; there is not any transformation of this kind between a sphere and a plane). What is the philosophical significance of topology?

Reichenbach examines the following example (*The philosophy of space and time*). Measurements of space, performed by a two-dimensional being, suggest that he lives on a sphere, but, in spite of such measurements, he believes he lives on a plane. There is not any difficult, when he limits himself to metric relationships: he could adopt appropriate co-ordinative definitions and those measurements would become compatible with a plane. But the surface of a sphere is a finite surface and he might do a round-the-world tour, that is he could walk along a straight line from a point A and eventually he would arrive to the point A itself. Really this is impossible on a plane and he therefore should assert that this last point is not the point A, but a different point B which, in all other respects, is identical to A. Now there are two possibilities: (i) he changes his theory and acknowledges that he lives on a sphere or (ii) he maintains his position, but he needs to explain why point B is identical to A although A and B are different and distant points of space; he could accomplish his task only fabricating a fictitious theory of pre-established harmony: everything that occurs in A, immediately occurs in B.

Reichenbach says the second possibility entails an anomaly in the law of causality. If we assume normal causality, topology become an empirical theory and we can discover the geometry of the real world. This example is another falsification of Kantian theory of synthetic a priori. Kant believed both the Euclidean geometry and the law of causality were a priori. But if Euclidean geometry were an a priori truth, normal causality might be false; if normal causality were an a priori truth, Euclidean geometry might be false. We arbitrarily can choose the geometry or we arbitrarily can choose the causality; but we cannot choose both. Thus the most important implication of the philosophical analysis of topology is that *the theory of space depends on normal causality*.

Time. Normal causality is the main principle that underlies not only the theory of space but also the theory of time. The solution to the problem of an empirical theory of space was found when we acknowledged the priority of topological relationships over metric relationships. Also in the philosophy of time we must recognize the priority of topology. We must distinguish between two different concepts which are fundamental to the theory of time, namely the *order* of time and the *direction* of time. Time order is definable by means of causality (see *The philosophy of space and time*). The definition is: *event A occurs before event B* (and, of course, event B occurs after event A) *if event A can produce a physical effect on event B*. When can event A affect event B? The theory of relativity states that it is required a finite time for an effect to go from event A to event B. The required time is finite because the velocity of light is a speed limit for all material particles, messages or effects and the velocity of light is finite. Suppose A and B are two events occurring in point PA and PB. Event A can affect event B if a light pulse emitted from PA when event A occurs reaches the point PB before event B occurs. If the light pulse reaches point PB when event B already occurred, event A cannot affect event B. If event A cannot affect event B and event B cannot affect event A, the order of the two events is indefinite and we could arbitrarily choose the event that occurs first or we might define the two event simultaneous; therefore simultaneity depends on a definition.

Reichenbach examines the consistency of this definition. Suppose an event A occurs before an event B and, from another point of view, the event A occurs after the event B. In this circumstance there is a closed causal chain so that the event A produces an effect on the event B and the event B produces an effect on the event A. The definition is consistent only if we assume that there are not closed causal

chains: *the order of time depends on normal causality*.

Reichenbach asserts that the relativity of simultaneity is independent from the relativity of motion. The relativity of simultaneity is due to the finite velocity of causal propagation. So it is a mistake - Reichenbach asserts in *The philosophy of space and time* and *From Copernicus to Einstein* - to derive the relativity of simultaneity from the relative motion of observers. Reichenbach also cautions against a possible misunderstanding of the multiplicity of observers in some expositions of the theory of relativity: observers are used only for convenience; the relativity of simultaneity has nothing to do with the relativity of observers. We must recognize - Reichenbach asserts - that the theory of an absolute simultaneity is a consistent theory although it is a wrong one. Absolute simultaneity and absolute time does not exist, but they are clever concepts.

Reichenbach also faces the problem of the *direction of time*. All mechanical processes are reversible: if f(t) is a solution of the equations of classical mechanics then f(-t) is also an admissible solution; also in the theory of relativity f(-t) is an admissible solution. Thus neither theory gives a consistent definition of the direction of time. In fact the *direction of time is definable only by means of irreversible processes*, ie processes that are characterized by an increase of entropy. But the definition is not straightforward. The second law of thermodynamics, which states the principle of increase of entropy, is a statistical law, not a deterministic law. Really the elementary processes of statistical thermodynamics are reversible, because they are controlled by the laws of classical mechanics. In fact all macroscopic processes are also reversible, in a sense: every upgrade of entropy is naturally followed by a corresponding downgrade; we cannot control the downgrade and thus we cannot reverse the process. But statistical thermodynamics asserts that after a large amount of time the entropy will diminish to the initial value. In an isolated system, in an infinite time, there are as many downgrades as upgrades of the entropy. Thus if we observe two states A and B, and the entropy of B is greater than the entropy of A, we cannot assert that B is later than A. But if we consider not an isolated system, but many isolated systems, we realized that the probability that we observe a decrease of entropy is less than the probability we observe an increase of entropy. We can therefore use many-system probabilities to define a direction of time. Reichenbach asserts that it is possible to define an entropy for the whole universe and the statistical theory proves that the entropy of the universe first increases and then decreases; thus we can define a direction of time only for sections of time, not for the whole time. Reichenbach notes that this theory of time was stated in 19th century by Boltzmann (Ludwig Boltzmann, b 1844 d 1906, Austrian physicist, formulated the statistical theory of entropy).

The special theory of relativity. The special theory of relativity gives an unified theory of space and time in the absence of gravitational field. One example of the necessity of an unified theory of space and time is the *length contraction*, an effect predicted by the theory; this effect shows that the length of a moving rod depends on simultaneity. The special theory of relativity states that the length of a rod measured using a metre that is at rest with respect to the rod is different from the length measured using a metre which is moving with respect to the rod. In the first instance we measure the length of the rod by means of the well-known method used by classical mechanics. But we use a different method when the measuring rod is not at rest with respect to the metre. We measure the length of the moving rod by means of the distance between the two points occupied at a given time by the two ends of the moving rod, ie we mark the simultaneous positions of the two ends and we measure the distance between those positions; thus this method depend on the definition of simultaneity, which also depends on a definition. It must be acknowledged that the length of a moving rod is a matter of definition, but the length contraction is a genuine physical hypothesis confirmed by experiments. We must also recognize the priority of time over

space: the ability to measure time is a requisite for the theory of space. Therefore only an unified theory of space and time is suitable. In spite of the necessity for an unified theory of space and time, Reichenbach states (in *The philosophy of space and time*) that space and time are different concepts which remain distinct in the theory of relativity. The *real* space is three-dimensional and the *real* time is one-dimensional: the four-dimensional space-time used in the theory of relativity is a mathematical artefact. Also the mathematical formulation of the special theory of relativity acknowledges the difference between space and time: the equation that defines the metric is dx^2 + dy^2 + dz^2 - dt^2 = ds^2 and the time coordinate is distinguishable from the space coordinates by the negative sign. How can we know the space is three-dimensional? and how can we recognize the difference between a real space and a mathematical space?

A physical effect is not immediately transmitted from one point to another distant point but it passes through every point between the source and the destination. This principle is known as *the principle of local action* and it denies the existence of action at a distance. In three-dimensional space the principle of local action is true while in a four-dimensional space it is false, so we can recognize that the real space is three-dimensional. We can also distinguish between a mathematical space and the real space because in a mathematical space the principle of local action is false. Reichenbach says that the truth of the principle of local action is an empirical fact, not an a priori truth: it could be false. But if this principle is true then there is only one n-dimensional space in which it is true; this n-dimensional space is the real space and n is the number of the dimensions of space. So we recognize that the real space is three-dimensional while the four-dimensional space used in the theory of relativity is a mathematical space, not a real one. We also recognize that the *unified theory of space and time depends on normal causality*.

Among the results of the special theory of relativity is *time dilation*: the period of a moving clock is greater than the period of a clock at rest and therefore the moving clock slows. Time dilation is an empirical hypothesis and Reichenbach says its physical meaning is that a clock does not measure the time coordinate but it measures *the interval*, ie the space-time distance between two events. In classical mechanics space is Euclidean and Pythagoras' theorem gives the distance ds between two points: ds^2 = dx^2 + dy^2 + dz^2; x,y,z are the space coordinates. The distance ds is measured by rod. Time is an independent coordinate and is measured by clock. The mathematical formulation of the special theory of relativity uses a four-dimensional space-time known as the *Minkowski space* (mathematician Hermann Minkowski, b 1864 d 1909, gave a mathematical formulation of Einstein's special theory of relativity), in which three coordinates are the space coordinates and one coordinate is the time coordinate. The distance ds between two points of Minkowski space is: ds^2 = dx^2 + dy^2 + dz^2 - dt^2; t is the time coordinate and ds (or ds^2) is the interval. A positive (negative) ds^2 is called a spacelike (timelike) interval. Suppose A and B are two events, interval ds^2 is negative and S is an inertial frame of reference moving with constant velocity v so that both events A and B occurs at the origin O of S, and suppose there is a clock in O; the time measured by the clock, called *characteristic time*, equals the interval ds. When the interval is positive, there is an inertial frame of reference S' with respect to which the two events are simultaneous; in this instance, the interval ds is realized by a measuring rod with the two ends coinciding with the events A and B and at rest with respect to S'. Time dilation shows an important difference between the special theory of relativity and classical mechanics; the special theory asserts that clocks and rods measure the interval while classical mechanics asserts they measure coordinates.

I briefly mention also Reichenbach's view on the velocity of light. He asserts that there is no way of measuring the velocity of light and proving it is constant, because the measurement of the velocity of light requires the definition of simultaneity which depends on the speed of light. Einstein - Reichenbach

says - does not prove the speed of light is constant, but the special theory of relativity assumes it is constant, ie it is constant by definition.

The general theory of relativity. Newton's second law of motion states that the acceleration **a** of a body is proportional to the force **F** applied, so that **F** = m * **a**, where m is the *inertial mass* which represents the resistance to acceleration (force and acceleration are vectors and I use bold face as indicator of vector). Newton's law of gravitation asserts that every particle attracts every other particle with a force **F** proportional to the product of *gravitational masses*: **F** = G (m * m') / **r**^2; **r** is the distance between the two particles, m and m' are the gravitational mass which represent the response to the gravitational force. In classical mechanics, gravitational mass and inertial mass are equivalent; this *principle of equivalence* accounts for the law of free fall which states that the acceleration of every falling body is the same. The principle of equivalence is one of the principle of the general theory of relativity and its consequences are very important.

Suppose a physicist is into a closed elevator and he observers a body attached to a spring; he find the spring is stretched. There are two different although equivalent explanations.

- First explanation. The body is attracted by the Earth and the gravitational force accounts for the stretching of the spring.
- Second explanation. The elevator is in empty space so there is not any gravitational force, but the elevator is accelerated and the inertia of the body causes the stretching of the spring.

The two explanation are indistinguishable because of the equivalence between gravitational and inertial mass. This thought experiment shows that an accelerated frames of reference can simulate a gravitational field. Now suppose that in another thought experiment the body does not exert any force on the spring. Also in this instance there are two explanations.

- First explanation. The elevator is at rest in empty space so there is not any force.
- Second explanation. The elevator is free falling in a gravitational field so its acceleration equals gravitational acceleration; the body is falling but also the spring, the elevator and the physicist are falling with the same acceleration and therefore they are relatively at rest and there is not any force.

The consequence of this second thought experiment is that a gravitational field can be eliminated by means of an accelerated frame of reference. The theory of general relativity states that free falling accelerated frames of reference are inertial systems. Reichenbach says that this hypothesis is not a consequence of the principle of equivalence; it is a genuine physical hypothesis which goes beyond experience. There is an important consequence of this hypothesis. The special theory of relativity is true in inertial frames of reference, so in every inertial system the motion of a light ray is represented by a straight line. But the general theory of relativity states that a free falling frame of reference is an inertial system, so the light moves in a straight line with respect to this frame of reference; with respect to a frame of reference which is at rest on Earth (in this system there is a gravitational field) the light rays are curved. The consequence is that light is curved by gravity. Another consequence of the hypothesis that a free falling frame of reference is an inertial system is the time dilation in the presence of a gravitational field.

The general theory of relativity gives an unified theory of space, time and gravitation; it requires a non-Euclidean four-dimensional geometry, known as Riemannian geometry. Reichenbach explains the

main properties of this kind of geometry and the main differences between Euclidean geometry and Riemannian geometry. In Euclidean geometry the distance between two points is given by a simple function of coordinates; also in Minkowski four-dimensional space-time the interval is calculable by means of coordinates. In Euclidean geometry the coordinates have both a metric and topological significance; this is true also in the special theory of relativity. In Riemannian geometry the four coordinates perform a topological function, not a metric one. This means that we cannot calculate the distance between two points by means of coordinates. The metric functions is performed by the *metric tensor* **g**; it is a mathematical entity represented by 16 components. The geometry of four-dimensional space-time depends on the metric tensor **g**; for example, if the components of **g** are

1 0 0 0
0 1 0 0
0 0 1 0
0 0 0 1

then the geometry is a Minkowski geometry (ie the geometry of the special theory). Thus the tensor **g** expresses the geometry. But **g** is determined by the gravitational field, because the metric tensor also expresses the acceleration of the frame of reference and the effects of an acceleration are equivalent to the effects of a gravitational field. The metric tensor **g** expresses both the physical geometry and the gravitational field. The consequence is astonishingly: *the geometry of the universe is produced by gravitational fields*. Therefore the general theory of relativity does not reduce gravitation to geometry; on the contrary, geometry is based on gravitation. The properties of space and time are empirical properties caused by gravitational fields.

The reality of space and time. Reichenbach asserts (in *The philosophy of space and time*) that the *reality of space and time is an unquestionable result of the epistemological analysis of the theory of relativity*. With respect to the problem of reality, space and time are not different from the other physical concepts. But the reality of space and time does not imply the concept of an absolute space and time. Space and time are relational concepts and we can study their properties because of the existence of physical objects, eg clocks, that realize relationships between space-time entities. Reichenbach also emphasizes the causal theory of space and time: *causality is the basis of both philosophical and physical theory of space and time.*

Quantum mechanics.

Interpretation of quantum physics: part I. The main thesis of Reichenbach's work on quantum mechanics (*Philosophic foundations of quantum mechanics*) is that *there is not any exhaustive interpretation of quantum mechanics which is free from causal anomalies*. A causal anomaly is a violation of the principle of local action; this principle states that the action at a distance does not exist. We have found the principle of local action and causal anomalies in Reichenbach's philosophy of space and time.

Two main interpretations of quantum mechanics are involved with the wave-particle duality. *Wave interpretation* states that atomic entities are waves or things that resemble waves; it grew out of the discovery of the wave-like nature of light and it is supported by many experiments, for example the two-slit experiment. In this experiment a beam of electrons is direct towards a screen with two slits and an interference pattern is produced behind the screen, showing that electrons act as waves. The *corpuscolar interpretation* regards atomic entities as particles; it is supported by a long standing tradition

and by the fact that atomic entities show corpuscular properties, eg mass and momentum. Both wave and corpuscular interpretation entail causal anomalies. For example corpuscular interpretation cannot fully explain the two-slit experiment. An electron acting as a particle goes through only one slit and its behaviour is independent of the existence of another slit in a different point of space. In fact, if one slit is open and the other is close, the interference pattern is not produced: electrons behave as if they were informed whether the other slit is open. But wave interpretation cannot fully explain a slightly different experiment. An electron can be localized by a detector put near a slit and the electron is detected as particle. However for every event in quantum realm there is an interpretation by means of particles or waves but there is not a unique interpretation for all events. Both corpuscular and wave interpretation are not verifiable; they are not matter of experience but they are matter of definition.

There are two models that are free of causal anomalies; they are restricted interpretations, ie they exclude the admissibility of certain statements. One is *Bohr-Heisenberg interpretation* (Niels Bohr, b 1885 d 1962, Danish physicist winner of Nobel prize in 1922, gave the first account of the quantum theory of atoms; Werner Karl Heisenberg, b 1901 d 1976, German physicist winner of Nobel prize in 1932, formulated matrix mechanics and proved the *principle of indeterminacy* according to which there is no way of measuring both position and momentum of atomic particles). This interpretation states that speaking about values of not measured physical quantities is meaningless. In the two-slit experiment, when the two slits are open and electrons interfere with themselves, the position of electrons cannot be measured; thus a statement about the position of electrons is meaningless and the particle interpretation is forbidden. There are two main faults - Reichenbach says - in Bohr-Heisenbergh interpretation: (i) Heisenberg indeterminacy principle becomes a meta-statement on the semantics of the language of physics and (ii) it implies the presence of meaningless statements in physics.

The other interpretation depends on three-valued logic, ie a formal system that acknowledges three truth values: true, false and indeterminate.

Mathematical formulation of quantum mechanics. Reichenbach carefully examines and explains the mathematical formulation of quantum mechanics. It is based on the notion of *quantum operator*; a quantum operator is a mathematical entity corresponding to a given classical quantity. For example, the quantum operator *energy* correspond to the energy in classical physics. A quantum operator can only assume discrete values while the corresponding classical quantity assumes continuous values. Note that an operator is not a function; it indicates a set of operation to be performed on a function.

Let U be a classical quantity; U depends on position **Q** and momentum **P**, that is U=F[**Q**,**P**] (position and momentum are vectors and I use bold face as indicator of vector; I use square brackets to show that a function depends on given quantities). The quantum operator corresponding to U is called Uop and is defined by the following statements.

- 1. For every function F[**Q**], substitute 'multiply by F[**Q**]' to 'F[**Q**]'.
- 2. Substitute 'multiply the first partial derivative with respect to **Q** by C' to '**P**', where C=h/(2*pi*i), h is the Planck constant, pi equals 3.14..., i is the square root of -1.
- 3. Substitute 'multiply the second partial derivative with respect to **Q** by C^2' to '**P**', where C=h/(2*pi*i), h is the Planck constant, pi equals 3.14..., i is the square root of -1.

Examples of quantum operators. Let T be the kinetic energy; in classical mechanics, the kinetic energy is given by the ratio of the square of momentum **P** to twice the mass m, that is T=**P**^2 / 2m. Quantum operator Top is given by Top=C^2 * (1/2m) * **D"** (I use symbol D' to indicate the first partial derivative

with respect to position and D" to indicate the second partial derivative with respect to position).

Let H be the mechanical energy, ie the sum of the kinetic energy T and the potential energy V: H=T+V[**Q**]; therefore Hop=Top+Vop=C^2 * (1/2m) * **D"** + V[**Q**]. If F is a given function, the result (indicated by Hop F) of performing the operations described by operator Hop on function F is C^2 * (1/2m) * **D"** F + V * F.

Classical and quantum physical quantities. Schrodinger equations. Quantum operators are useful to describe quantum systems; they transform physical quantities defined in classical mechanics into quantum quantities. Let U and Uop be a physical quantity and the corresponding operator; the very simple rule is

(E1) Uop F = U * F.

In equation E1 the function F is a parameter and the function U is the variable; functions F satisfying equation E1 are called *eigenfunctions*. When F is an eigenfunction, the variable U satisfying equation E1 is called an *eigenvalue*. Usually eigenvalues do not belong to a continuous interval but they are discrete values and they represent the admissible values of quantity U. The first Schrodinger equation can be derived from equation E1 substituting the energy H to the general function U.

(S1) Hop F = H * F that is
(S1) C^2 * (1/2m) * **D"** F + V * F = H * F.

The physical meaning of first Schrodinger equations is that the energy H of an atomic particle, eg an electron, can only assume values satisfying the equation; these values are discrete and belong to a set of fixed values. A given function F satisfying equation S1 is a wave function and describe a stationary state. The amplitude of the wave function F gives the probability to find the particle in a given point of space. The second Schrodinger equation is:

(S2) Hop PSI = (ih/2*pi) * PSI'

where PSI is a linear combination of wave functions and PSI' is the first partial derivative with respect to time. Equation S2 describe a quantum system by means of function PSI; this function is the infinite sum of eigenfunctions.

(S3) PSI = K1 * F1 + K2 * F2 + K3 * F3 + K4 * F4 + ...

where Kn is a series of coefficients and Fn is the series of eigenfunctions satisfying equation E1. The square of coefficient Kn gives the probability that the system is in the state described by Fn, ie the square of Kn is the probability that the value of U equals the eigenvalue corresponding to Fn. The second Schrodinger equations is a deterministic equation, ie if we know the wave function PSI in a given time t, we can calculate PSI in every time. Note that PSI does not fully describe the quantum system; it only gives the probability (by means of coefficients Kn) that the energy of the quantum system equals a specific value. Suppose a measurement of U gives the value Un, which is the eigenvalue corresponding to the eigenfunction Fn; then PSI = Fn. A measurement of U therefore changes the function PSI so that PSI = Fn, for an appropriate eigenfunction Fn.

Heisenberg indeterminacy principle. Let **P**op and **Q**op the quantum operator corresponding to momentum and position. It is easy to verify that for every function F

(H) **P**op **Q**op F **-** **Q**op **P**op F = C * F

and the equation H is a mathematical formulation of Heisenberg indeterminacy principle. The proof of equation H is straightforward.

> **P**op **Q**op F **-** **Q**op **P**op F =
> **P**op (**Q** * F) - **Q**op (C * **D'** F) =
> C * (**D'** (**Q** * F) **-** **Q** * (**D'** F) =
> C * (**D'** **Q** * F + **Q** * **D'** F **-** **Q** * **D'** F) =
> C * F

Reichenbach explains the physical meaning of equation H. Equation H proves that the eigenvalues of position and momentum are different. Now suppose a physicist measures both position and momentum of a particle; let Fp be the eigenfunction corresponding to the measured momentum and Fq be the eigenfunction corresponding to the measured position. From the measurement of position: PSI = Fp; from the measurement of momentum: PSI = Fq. Therefore Fp = Fq and the eigenvalues are the same; but the eigenvalues are different. So position and momentum of a particle cannot be simultaneously measured. Reichenbach asserts that Heisenberg indeterminacy principle is not due to the alleged interference an observer exerts on particles (the explanation of indeterminacy principle in terms of an interference is due to Heisenberg). This principle is an objective law of nature, and it can be stated without reference to observers.

The interpretation of quantum physics: part II. After the mathematical formulation of quantum mechanics, Reichenbach states the basic assumption of the different interpretation of quantum mechanics. *Corpuscolar interpretation* relies on the following definition. *If a measurement of U equals Um, then Um is the values of U not only at the time of measurement but also immediately before and immediately after*. If a physicist measures the position of an electron and immediately after its momentum, than he know both position and momentum of the electron. In this interpretation atomic particles have both momentum and position, so they are real particles; a physicist can also measure both momentum and position. The knowledge of both position and momentum is unusable because of the difference between the eigenfunctions: if PSI equals the eigenfunction "position" the knowledge of momentum is totally unused while if PSI equals the eigenfunction "momentum" the knowledge of position is totally unused.

Wave interpretation states that *the value of a measured quantity exists after the measurement but before the measurement the quantity assumes simultaneously all possible values*. The effect of the measurement is the *collapse of wave function*.

Bohr-Heisenberg interpretation asserts that *the value of a physical quantity exists only after the measurement; a statement about this value before the measurement is therefore meaningless.*

The interpretation based on *three-valued logic* states that *a statement about a not measured physical quantity can be neither true nor false: it can be indeterminate*. The following tables show the properties of logical connectives in the three-valued logic suggested by Reichenbach (symbols used in these tables differ from symbols used by Reichenbach).

negation: cyclic (-) diametrical (?) complete (^))

A	-A	?A	^A
T	I	F	I
I	F	I	T

F	T	T	T

or (v) and (&)
implication: standard (>) alternative (#) quasi (*)
equivalence: standard (=) alternative (<=>)

A	B	(AvB)	(A&B)	(A>B)	(A#B)	(A*B)	(A=B)	(A<=>B)
T	T	T	T	T	T	T	T	T
T	I	T	I	I	F	I	I	F
T	F	T	F	F	F	F	F	F
I	T	T	I	T	T	I	I	F
I	I	I	I	T	T	I	T	T
I	F	I	F	I	T	I	I	F
F	T	T	F	T	T	I	F	F
F	I	I	F	T	T	I	I	F
F	F	F	F	T	T	I	T	T

Suppose P is the statement "the momentum of the particle is p" and Q is the statement "the position of the particle is q"; then Heisenberg indeterminacy principle is expressed by the following statement: (Pv-P) # --Q. The following table is the truth-table of this sentence.

P	Q	-P	Pv-P	-Q	--Q	(Pv-P) # --Q
T	T	I	T	I	F	F
T	I	I	T	F	T	T
T	F	I	T	T	I	F
I	T	F	I	I	F	T
I	I	F	I	F	T	T
I	F	F	I	T	I	T
F	T	T	T	I	F	F
F	I	T	T	F	T	T
F	F	T	T	T	I	F

The truth of (Pv-P) # --Q implies that the situations described in 1st, 3rd, 7th and 9th row of the truth-table are forbidden. Reichenbach explains how the three-valued interpretation hides causal anomalies. Look at the two-slit experiment. Suppose the two slits are open and the interference pattern is produced. Let P(A) be the probability that an electron goes through the first slit; let P(B) be the probability that an electron goes through the second slit; let P(A,C) be the probability that an electron gone through the first slit hits the screen in point C; let P(B,C) be the probability that an electron gone through the second slit hits the screen in point C; let P(C) the probability that an electron hits the screen in point C. Corpuscular interpretation suggests that

(E2) P(C)=P(A)*P(A,C)+P(B)*P(B,C)

In fact P(C) is not given by equation E2: this is the origin of causal anomalies. Equation E2 can be expressed by the following statement: (AvB)#C, where A is "the electron goes through the first slit", B is "the electron goes through the second slit" and C is E2. We know that (i) if an electron goes through the first slit then it does not go through the second slit and vice versa, ie A # -B and B # -A; (ii) if an electron

does not go through a slit then it goes through the other slit, ie -A # B and -B # A. In classical logic, (i) and (ii) imply AvB, ie [(A # -B)&(B # -A)&(-A # B)&(-B # A)] # AvB is true (look at the following table).

A B [((A # -B) & (B # -A)) & ((-A # B) & (-B # A))] # AvB
F F FTT T FTT F TFF F TFF T F

The truth-table is restricted to one combination of truth-values because in the other combinations the consequence AvB is true and the statement Z # (AvB) is true for all Z. In corpuscular interpretation of two-slit experiment the statement (A # -B)&(B # -A)&(-A # B)&(-B # A) is true; in classical logic the statement [(A # -B)&(B# -A)&(-A # B)&(-B # A)] # AvB is true and thus also AvB is true; therefore E2 is true. But E2 does not give the correct formula for the probability and so there is a causal anomaly. In three-valued logic, (i) and (ii) do not imply AvB; this fact is proved by means of the following table.

A B [((A # -B) & (B # -A)) & ((-A # B) & (-B # A))] # AvB
I I ITF T ITF T FTI T FTI F I

Thus we cannot assert E2 and there is not any causal anomaly.

Reichenbach's epistemology.

The structure of science and the verifiability principle. A scientific theory is a formal system which requires a physical interpretation by means of co-ordinative definitions. Reichenbach's philosophical research on the theory of relativity and quantum mechanics implicitly depends on this view. For example, the distinction between mathematical geometry and physical geometry entails the distinction between a purely formal system and a system interpreted by means of definitions. Co-ordinative definitions are true by convention and cannot be verified, but they are not meaningless; in fact scientific theories require them to acquire an empirical significance. The acknowledgement of the existence of meaningful and not verifiable sentences is very important for a right interpretation of the epistemology of logical positivism. The *verifiability principle* is often regarded as the most important principle of logical positivism; it states that the meaning of a sentence is its method of verification and a sentence which cannot be verified is meaningless. According to this principle, co-ordinative definitions might be meaningless; on the contrary, in Reichenbach opinion, they are not only meaningful but also required by scientific theories. Note that Reichenbach explicit agrees with verifiability principle. In 'The philosophical significance of the theory of relativity' (1949) he says that the meaning of a sentence is reducible to its method of verification; he also says that a physicist can fully understand the Michelson's experiment only if he adopts the verifiability theory of meaning. In the same essay, Reichenbach says that the logic foundation of the theory of relativity is the discovery that many problems are not verifiable; these problems can be solved by means of co-ordinative definitions. Thus co-ordinative definitions are meaningful and not verifiable. So we must acknowledge that Reichenbach agrees with the verifiability principle and, at the same time, asserts that in scientific theories there are meaningful sentences, namely co-ordinative definitions, that are not verifiable. Why these sentences are not meaningless? Because they belong to scientific theories that are verifiable. For example, Reichenbach states that (i) the Euclidean geometry is not verifiable, (ii) the co-ordinative definitions of geometrical entities are not verifiable but (iii) the Euclidean geometry plus the co-ordinative definitions of geometrical entities is verifiable. *The theory must be verifiable, the individual statements belonging to the theory can be not verifiable*.

Conventionalism vs empiricism. In Reichenbach opinion, among the purposes of the philosophy of

science is the search for a distinction between empirical and conventional sentences. The separation of empirical from conventional sentences is not only possible but also necessary for a full understanding of scientific theories. Philosophical research on modern science clearly shows that conventional elements are present in scientific knowledge. The description of our world is not uniquely determined by observations, but there is a plurality of equivalent descriptions; for example, we can use different geometry for describing the same space. But conventionalism is in error. For example, conventionalism states that we can always adopt the Euclidean geometry by means of appropriate definitions. But if we adopt a set of definitions so that the geometry on the Earth is Euclidean, it is possible that in another point of the universe the same set of definitions entails a non-Euclidean geometry; so we can discover an objective difference between different points of space. Note that Reichenbach does not state that scientific knowledge can be proved by means of experience. On the contrary, he asserts that scientific theories are based on physical hypotheses which are not a logical consequence of experiments, eg the general theory of relativity is based on Einstein's hypothesis that free falling frames of reference are inertial systems; we cannot prove this hypothesis, but we can verify its consequences. *Scientific theories cannot be proved, but we can test their forecasts.*

Causality. Causality plays a central role in Reichenbach's philosophy of science. Reichenbach uses the theory of causality as a key to provide access to modern physics and understanding of the philosophical significance of both the theory of relativity and quantum mechanics. According to Reichenbach, the causal theory of space and time is the basis for both the theory of relativity and the philosophy of space and time. In the theory of relativity it is always possible to choose a set of co-ordinative definitions satisfying normal causality. Therefore different geometrical systems are not equivalent and they can be divided into two groups, one group satisfying normal causality while the other entails causal anomalies. Only geometrical systems belonging to the first group are admissible. It is the experience that decides whether a given geometry belongs to the first group; thus conventionalism's view on geometry is wrong. In quantum mechanics there is not any set of co-ordinative definitions which is free from causal anomalies and satisfies classical logic. In fact, a three-valued logic is required to give an interpretation satisfying normal causality.

Science and philosophy. First of all, we must acknowledge his scientific seriousness and physical-mathematical skill. His deep knowledge of modern physics is unquestionable. Reichenbach's positive attitude towards scientific knowledge was influenced not only by his teachers but also by his own philosophical views. In his opinion, modern physics is concerned with problems that, until the late 19th century, were regarded as philosophical problems, eg the nature of space and time, the source of gravitation, the real extent of causality. In 17th and 18th century - Reichenbach says - philosophers were usually interested in science and many of them were also mathematicians and physicists, eg Descartes and Leibniz; Kant's epistemology was based on scientific knowledge. But since 18th science became extraneous to philosophy. Nowadays - Reichenbach wrote in 1928 - there is an almost complete separation of philosophy from physical sciences; philosophical researches into epistemology are fruitless, because of this separation. On the other hand, scientists cannot explicitly help the progress of epistemology: they are too much involved in technical researches. There is only one way to overcome this difficulty: philosophers, who are not concerned with technical subjects but deal with genuine philosophical problems, must dedicate themselves to the philosophical analysis of modern physics, so they can clearly express the implicit philosophical content of scientific theories. In fact, modern physics is rich in philosophical consequences: there is more philosophy in Einstein's work than in many philosophical systems.

Bibliography. Reichenbach's main works, arranged in chronological order.

1916 *Der Begriff der Wahrscheinlichkeit fur die mathematische Darstellung der Wirklichkeit*, dissertation, Erlangen, 1915

1920 *Relativitatstheorie und Erkenntnis apriori* (English translation *The theory of relativity and a priori knowledge*, Berkeley : University of California Press, 1965)

1921 'Bericht uber eine Axiomatik der Einsteinschen Raum-Zeit-Lehre' in *Phys. Zeitschr.*, 22

1922 'Der gegenwartige Stand der Relativitatsdiskussion' in *Logos*, X (English translation 'The present state of the discussion on relativity' in *Modern philosophy of science : selected essays by Hans Reichenbach*, London : Routledge & Kegan Paul ; New York : Humanities press, 1959)

1924 *Axiomatik der relativistischen Raum-Zeit-Lehre* (English translation *Axiomatization of the theory of relativity*, Berkeley : University of California Press, 1969)

1924 'Die Bewegungslehre bei Newton, Leibniz und Huyghens' in *Kantstudien*, 29 (English translation 'The theory of motion according to Newton, Leibniz, and Huyghens' in *Modern philosophy of science : selected essays by Hans Reichenbach*, London : Routledge & Kegan Paul ; New York : Humanities press, 1959)

1925 'Die Kausal-strukture der Welt und der Unterschied von Vergangenheit und Zukunft' in *Sitzungsber d. Bayer. Akad. d. Wiss.*, math-naturwiss.

1927 *Von Kopernikus bis Einstein. Der Wandel unseres Weltbildes* (English translation *From Copernicus to Einstein*, New York : Alliance book corp., 1942)

1928 *Philosophie der Raum-Zeit-Lehre* (English translation *The philosophy of space and time*, New York : Dover Publications, 1958)

1929 'Stetige Wahrscheinlichkeits folgen' in *Zeitschr. f. Physik*, 53

1929 'Ziele und Wege der physikalische Erkenntnis' in *Handbuch der Physik* ed. by Hans Geiger and Karl Scheel, Bd IV, Berlin : Julius Springer

1930 *Atom und kosmos. Das physikalische Weltbild der Gegenwart* (English translation *Atom and cosmos; the world of modern physics*, London : G. Allen & Unwin, ltd., 1932)

1931 *Ziele und Wege der heutigen Naturphilosophie* (English translation 'Aims and methods of modern philosophy of nature' in *Modern philosophy of science : selected essays*, Westport : Greenwood Press, 1959)

1933 'Kant und die Naturwissenschaft', *Die Naturwissenschaften*, 33-34

1935 *Wahrscheinlichkeitslehre : eine Untersuchung uber die logischen und mathematischen Grundlagen der Wahrscheinlichkeitsrechnung* (English translation *The theory of probability, an inquiry into the logical and mathematical foundations of the calculus of probability*, Berkeley : University of California Press, 1948)

1938 *Experience and prediction: an analysis of the foundations and the structure of knowledge*, Chicago : University of Chicago Press

1944 *Philosophic foundations of quantum mechanics,* Berkeley and Los Angeles : University of California press

1947 *Elements of symbolic logic*, New York, Macmillan Co.

1948 *Philosophy and physics*, 'Faculty research lectures, 1946', Berkeley, Univ. of California Press

Relativism

Relativism is sometimes identified (usually by its critics) as the thesis that all points of view are equally valid. In ethics, this amounts to saying that all moralities are equally good; in epistemology it implies that all beliefs, or belief systems, are equally true. Critics of relativism typically dismiss such views as incoherent since they imply the validity even of the view that relativism is false. They also charge that such views are pernicious since they undermine the enterprise of trying to improve our ways of thinking.

Perhaps because relativism is associated with such views, few philosophers are willing to describe themselves as relativists. However, most of the leading thinkers who have been accused of relativism--for example, Ludwig Wittgenstein, Peter Winch, Thomas Kuhn, Richard Rorty, Michel Foucault, Jacques Derrida--do share a certain common ground which, while recognizably relativistic, provides a basis for more sophisticated, and perhaps more defensible, positions.

Although there are many different kinds of relativism, they all have two features in common.

> 1) They all assert that one thing (e.g. moral values, beauty, knowledge, taste, or meaning) is relative to some particular framework or standpoint (e.g. the individual subject, a culture, an era, a language, or a conceptual scheme).
>
> 2) They all deny that any standpoint is uniquely privileged over all others.

It is thus possible to classify the different types and sub-types of relativism in a fairly obvious way. The main genera of relativism can be distinguished according to the object they seek to relativize. Thus, forms of moral relativism assert the relativity of moral values; forms of epistemological relativism assert the relativity of knowledge. These genera can then be broken down into distinct species by identifying the framework to which the object in question is being relativized. For example, moral subjectivism is that species of moral relativism that relativizes moral value to the individual subject.

How controversial, and how coherent, these forms of relativism are will obviously vary according to what is being relativized to what, and in what manner. In contemporary philosophy, the most widely discussed forms of relativism are moral relativism, cognitive relativism, and aesthetic relativism.

Renaissance

"Renaissance" is the name given to the great intellectual movement in the fourteenth and fifteenth centuries--a period which saw the transition from the Middle Ages to modern times. It began in the revolt of men of culture against the intellectual sterility and narrowness of the medieval spirit, and especially against scholasticism, whose pedantic and dogmatic narrowness had reached the extreme point of its development. The Renaissance began in Italy, and its first period (1300 to 1375) was marked by a universal revival of interest in classic literature and the classic ideals. It was a great revolt against bigotry and in favor of mental freedom and its first sign was a passion for the largeness and richness of the pagan world. Traces of this feeling can be seen in *Dante*(1265-1321), who, although thoroughly medieval in his sympathies, chose Virgil as his model, and who, in the vigor and magnificence of his own verse, was a striking contrast to the dull formalists who had before his time written for the men of the Middle Age. *Petrarch*(1304-1374) is the first true son of the Rennaissance. In his poem written in Latin hexameter on the subject of the Second Punic War and entitled *Africa*, he followed the classic models. He traveled in foreign countries and thus knew a larger world than his predecessors; and he may be said to have rediscovered Greek, which for some six centuries had been lost to the western world. His friend and disciple *Boccaccio* studied that language, and by his master's advice made a translation of Homer into Latin. Greeks were now encouraged to come from Constantinople to Italy, and in 1396 the learned Manuel Chrysolas began to teach in the chair of Greek founded at the instance of Salutato and Palla degli Strozzi at Florence. A Platonic academy was opened in the same city under the patronage of Cosimo de' Medici. Greek texts were brought from Constantinople, Europe was ransacked for copies of the long unused Latin classics, copyists multiplied them, libraries were founded, and schools for the study of both Greek and Latin in their classic forms were opened at Rome, Mautua, Verona, and many other towns. Pope Nicholas V earnestly fostered the new movement, and laid the foundation of the great Vatican collection; Cardinal Bessarion presided over the formation of the Library of St. Mark at Venice. Individual scholars went about looking for manuscripts of lost authors, for coins, medals, bronzes- anything that could give a better knowledge of classical antiquity. Among these men, the most famous were *Poggio Bracciolini*, who brought to light once more Quintilian, Lucretius, part of Cicero, Columella, Vitruvius, Silius Italicus and Asconius; and Cyriacus of Ancona, who sounded the key-note of the new movement in his famous saying "I go to awake the dead."

The second period of the Renaissance begins about 1375, and is marked by a continued zeal for classical study, and by the developmental of a broad learning and the new view of the intellectual life which is known as Humanism. By this time the movement had spread Germany and France and the northern countries generally, where it developed into the wide scholarship and sound learning of men like Erasmus, Melanchthon, Reuchlin, the Scaligers, Muretus, and Casanbon. The movement had now gone far beyond the mere revival of classical studies, and was felt in every department of life. In philosophy it gradually replaced the purely formal methods of thought that

scholasticism had fostered; in science it led to the great discoveries of Galileo and Copernicus; in architecture it brought about the revival of the classic style; in art it developed the new school of painting of which Michael Augelo and Raphael in Italy were the great names, and still another school in the Netherlands and Flanders; in religion its influence is seen in the revolt of Luther; and it indirectly inspired the passion for exploration that led to the discovery of the New World.

Rights

Most generally, a right is a special advantage that someone gains because of his or her particular status. The "special advantage" might include gaining a liberty, a power, an entitlement, or an immunity. The "particular status" might include one's status as a human being, a woman, a minority, an animal, a child, or a citizen of some country. This general notion of "right" applies in both legal and moral contexts. For example, in the legal context, if I have the status of being a citizen of the United States, then I am entitled to the legal rights of any citizen under U.S. law. In the moral context, if I simply have the status of being human, then I am entitled to human rights that apply to all humans. Also in the moral context, if I am an animal, then I am entitled to any animal rights that may apply to animals of my kind. Moral philosophers are principally concerned with rights that are not simply created by political institutions such as the U.S. government. In this more narrow sense, a moral right is a justified constraint upon how others may act.

CLASSIC DISCUSSIONS. The modern notion of "rights" came to prominence in 17th and 18th century natural law theories. In his Latin work *The Law of War and Peace* (1625), natural law theorist Hugo Grotius (1583-1645) expressed the notion of rights with the Latin term *ius*, a term that he also used to mean "law," as in the phrase "law of nature" (*ius naturae*). Inspired by Grotius, Thomas Hobbes introduced the English term "right" into political philosophy with his interpretation of *ius naturale* as "right of nature":

> The *right of nature*, which writers commonly call *ius naturale*, is the liberty each man has to use his own power as he will himself, for the preservation of his own nature, that is to say, of his own life, and consequently of doing anything which, in his own judgment and reason, he shall conceive to be the aptest means thereunto. [*Leviathan*, Ch. 14]

For Hobbes, given the warring condition of the state of nature, my "right of nature" amounts to a liberty to protect myself from attack however I can. Later social contract theorists described the state of nature more optimistically, and, consequently rights of nature went beyond merely the liberty of self-preservation.

We find this more substantive notion of natural rights in the *Second Treatise of Government* (1690) by British philosopher John Locke (1632-1704). Locke argues that God created people free and equal in the state of nature and that, in this condition, no one is naturally sovereign over anyone else. In view of this natural equality, Locke maintains that it is a law of nature that no one should harm another person's life, health, liberty or possessions:

> The state of nature has a law of nature to govern it, which obliges everyone: and reason, which is that law, teaches all mankind, who will but consult it, that being all equal and independent, no one ought to harm another in his life, health, liberty, or possessions [*Second Treatise of Government*, 2:6]

These, then, are our foundational and God-given natural rights. Locke emphasizes that the state of nature is not necessarily a state of war. A state of war is declared only when someone violates our rights. In that case, the offender deserves to be punished, and even killed. We remedy conflicts in the state of nature by

making contracts with each other to create a civil society. This government is authorized to judge us and to defend our natural rights. However, these governments may be dissolved if they violate laws and threaten the life, liberty and property of the individual. Locke devotes particular attention to our right to possessions. We acquire property by mixing our labor with something that is held in common.

Locke's view of natural rights inspired 18th century political reformers such as Thomas Jefferson, which we see in the opening of the "Declaration of Independence":

> We hold these Truths to be self-evident, that all Men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty, and the Pursuit of Happiness -- That to secure these Rights, Governments are instituted among Men, deriving their just Powers from the Consent of the Governed, that whenever any Form of Government becomes destructive of these Ends, it is the Right of the People to alter or to abolish it, and to institute new Government, laying its Foundation on such Principles, and organizing its Powers in such Form, as to them shall seem most likely to effect their Safety and Happiness.

In an early draft of the Declaration, Jefferson follows Locke more closely by listing our natural rights as those of life, liberty and property. However, Jefferson later considered property to be only a means to happiness, he replaced "property" with "happiness." We also see Locke's influence in Emmanuel Sieyès' 1789 "Declaration of the Rights of Man" adopted by the French assembly:

> Men are born and remain free and equal in rights … [and the] aim of all political association is the conservation of the natural and imperscriptable rights of man … [including] liberty, property, security, and resistance to oppression.

Because of political documents such as these, the notion of natural rights became deeply imbedded in modern moral vocabulary. 18th century political documents and discussions of rights focused principally on a small set of foundational rights, such as life, liberty, and happiness. From these, we were to deduce more specific rights. This strategy is the direct result of natural law theories that articulated a few very general principles of natural law, and stipulated that more specific rules should be deduced from these.

In his *Principles of Moral and Political Philosophy* (1785), British philosopher William Paley (1743-1805) notes several conceptual distinctions regarding rights, which were common to 18th century discussions of the topic. Paley notes that rights are either natural or adventitious (i.e., non-essential); the distinction here rests on whether rights are created by society. Natural rights include those listed by Locke, and adventitious rights are those which people in power have over subjects. Rights are also alienable or unalienable, that is, transferable or non-transferable. For Paley, rights to specific pieces of property are alienable insofar as they can be taken away. Contrary to Locke, Paley also believes that civil liberties are also alienable to the extent that we can sell our freedoms to tyrants. By contrast, unalienable rights are those that superiors have over subordinates, such as masters over servants. Finally, rights are perfect or imperfect, that is, whether they can or cannot be asserted by force. Perfect rights are those to life and property. Imperfect rights are those to employment or charity, and a child's rights to affection.

CONTEMPORARY DISCUSSIONS. Contemporary rights theorists have developed further analyses of rights. An initial division is between positive and negative rights. Positive rights are rights to benevolent actions from other people, such as rights to food, clothing, and shelter, or the right of an accident victim to be helped. Given the emphasis on benevolence, positive rights are sometimes called welfare rights. Negative rights, by contrast, are rights of noninterference. These include two subgroups of rights: active and passive rights. Active rights (or liberty rights) are rights to do as one chooses. For example, the liberty right of movement entitles me to travel without being chained or locked up. Passive

rights involve the right to let alone, such as the right not to be injured, and the right to keep trespassers off my property.

Today, rights theory continues to have practical political applications, just as it did in the 18th century. The most important example of this is *The Universal Declaration of Human Rights* adopted on December 10, 1948, by the General Assembly of the United Nations. Whereas 18th century rights theorists focused on the uncreated or "natural" aspect of rights, thereby terming them "natural rights," the *Universal Declaration* focuses our particular status as humans, thereby terming them "human rights." Many elements of the *Universal Declaration* draw on classic concepts, such as the equality of people, the inalienable nature of rights, and the fact that these rights cut across all political boundaries. However, the *Universal Declaration* also departs from 18th century models. Unlike the 18th century discussions, which - inspired by natural law theory -- articulated only a few rights, the *Universal Declaration* lists dozens of rights. Along with rights to "life, liberty and the security of person," all humans also have specific rights against enslavement, torture, arbitrary arrest, and exile. We have a cluster of rights regarding due process in prosecution, such as the presumption of innocence. There are a series of liberty rights involving the right to movement, to marry, to have a family, to divorce, to freedom of thought, and to religion practice. There are political rights to participate in "genuine elections" and cultural rights to devolop one's personality. Economic rights include the right to work, to favorable pay, to join trade unions, and to paid holidays. We also have welfare rights to social security, to health care, to special assistance for child care, and to free education. Although few if any countries today adequately abide by all of these rights, the *Universal Declaration* sees these as a "common standard of achievement for all peoples and all nations."

Roman Philosophy

Roman philosophy is thoroughly grounded in the traditions of Greek philosophy. Interest in the subject was first excited at Rome in 155 BCE. by an Athenian embassy, consisting of the Academic Carneades, the Stoic Diogenes, and the Peripatetic Critolaus. Of more permanent influence was the work of the Stoic Panaetius, the friend of the younger Scipio and of Laelius; but a thorough study of Greek philosophy was first introduced in the time of Cicero and Varro. In a number of works they tried to make it accessible even to those of their countrymen who were outside the learned circles. Cicero chiefly took it up in a spirit of eclecticism ; but among his contemporaries Epicureanism is represented in the poetical treatise of Lucretius on the nature of things, and Pythagoreanism by Nigidium Figulus. In Imperial times Epicureanism and Stoicism were most popular, especially the latter, as represented by the writings of Seneca, Cornutus, and the emperor Marcus Aurelius; while Eclectic Platonism was taken up by Apuleius of Madaura. One of the latest philosophical writers of antiquity is Boethius, whose writings were the chief source of information as to Greek philosophy during the first centuries of the Middle Ages.

The Internet Encyclopedia of Philosophy

Jean Jacques Rousseau (1712-1778)

French deistic philosopher and author; b. at Geneva June 28, 1712; d. at Ermenonville (28 m. n.e. of Paris) July 2, 1778. His mother died at his birth, and his father, a dissipated and violent-tempered man, paid little attention to the son's training, and finally deserted him. The latter developed a passion for reading, with a special fondness for Plutarch's *Lives*. Apprenticed first to a notary and then to a coppersmith, he ran away (1728) to escape the rigid discipline, and, after wandering for several days, he fell in with Roman Catholic priests at Consignon in Savoy, who turned him over to Madame de Warens at Annecy, and she sent him to an educational institution at Turin. Here he duly abjured Protestantism, and next served in various households, in one of which he was charged with theft. After more wanderings he was at Chambery (1730), from which Madame de Warens had removed. In her household he spent eight years diverting himself in the enjoyment of nature, the study of music, the reading of the English, German, and French philosophers and chemistry, pursuing the study of mathematics and Latin, and enjoying the playhouse and opera. He next spent eighteen months at Venice as secretary of the French ambassador, Comte de Montaignu (1744-45). Up to this time, when he was thirty-nine, his life, the details of which he publishes in his *Confessions* (Geneva, 1782), may be described as subterranean. He now returned to Paris, where his opera *Les Muses galantes* failed, copied music, and was secretary of Madame Dupin. Here he came into association with Diderot, Grimm, D'Alembert, Holbach, and Madame d'Epinay, and was admitted as a contributor to the *Encyclopedie;* and his gifts of entertainment, reckless manner, and boundless vanity attracted attention. With the *Discours sur les sciences et les arts* (Paris, 1750), a prize essay in which he set forth the paradox of the superiority of the savage state, he proclaimed his gospel of "back to nature." His operetta *Devin du village* (1752) met with great success. His second sensational writing appeared*: Discours sur l'origine et les fondements de l'inégalité parmi les hommes* (1753), against the inequalities of society. His fame was then assured. In 1754 he revisited Geneva, was received with great acclamation, and called himself henceforth " citizen of Geneva." In 1756, upon invitation of Madame d'Epinay, he retired to a cottage (afterward " The Hermitage ") in the woods of Montmorency, where in the quiet of nature he expected to spend his life; but domestic troubles, his violent passion for Countess d'Houdetot, and Ms morbid mistrust and nervous excitability, which lost him his friends, induced him to change his residence to a chateau in the park of the duke of Luxembourg, Montmorency (1758-62). His famous works appeared during this period: *Lettre à d'Alembert* (Amsterdam, 1758); *Julie ou la nouvelle Heloise* (1761)*; Du Contrat social* (Amsterdam, 1762); and *Emile ou de 1'education* (Amsterdam, 1762). The last-named work was ordered to be burned by the French parliament and his arrest was ordered; but he fled to Neuchatel, then within the jurisdiction of Prussia. Here he wrote his *Lettres ecrites de la Montagne* (Amsterdam, 1762), in which, with reference to the Geneva constitution, he advocated the freedom of religion against the Church and police. Driven thence by peasant attacks (Sept., 1765), he returned to the Isle St. Pierre in the Lake of Bienne. The government of Berne ordered him out of its territory, and he

accepted the asylum offered to him by David Hume in England (Jan., 1766). But his morbid misanthropy, now goaded to an insane sense of being persecuted, made him suspicious of plots, and led him to quarrel with his friends for not making his opponents their own enemies, and he fled to France (1767). After wandering about and depending on friends he was permitted to return to Paris (1770), where he finished the *Confessions* begun in England, and produced many of his best stories. Here he copied notes, and studied music and botany. His dread of secret enemies grew upon his imagination, until he was glad to accept an invitation to retire to Ermenonville (1778), where his death came suddenly.

Rousseau reacted against the artificiality and corruption of the social customs and institutions of the time. He was a keen thinker, and was equipped with the weapons of the philosophical century and with an inspiring eloquence. To these qualities were added a pronounced egotism, self-seeking, and an arrogance that led to bitter antagonism against his revolutionary views and sensitive personality, the reaction against which resulted in a growing misanthropy. Error and prejudice in the name of philosophy, according to him, had stifled reason and nature, and culture, as he found it, had corrupted morals. In *Emile* he presents the ideal citizen and the means of training the child for the State in accordance with nature, even to a sense of God. This "nature gospel" of education, as Goethe called it, was the inspiration, beginning with Pestalozzi, of world-wide pedagogical methods. The most admirable part in this is the creed of the vicar of Savoy, in which, in happy phrase, Rousseau shows a true, natural susceptibility to religion and to God, whose omnipotence and greatness are published anew every day. The *Social Contract*, on the text that all men are born free and equal, regards the State as a contract in which individuals surrender none of their natural rights, but rather agree for the protection of them. Most remarkable in this projected republic was the provision to banish aliens to the state religion and to punish dissenters with death. The *Social Contract* became the text-book of the French Revolution, and Rousseau's theories as protests bore fruit in the frenzied bloody orgies of the Commune as well as in the rejuvenation of France and the history of the entire Western world.

Rule Utilitarianism

Rule utilitarianism is a formulation utilitarianism which maintains that a behavioral code or rule is morally right if the consequences of adopting that rule are more favorable than unfavorable to everyone. It is contrasted with *act utilitarianism* which maintains that the morality of each action is to be determined in relation to the favorable or unfavorable consequences that emerge from that action. The principle of rule-utilitarianism is a litmus test only for the morality of moral rules, such as "stealing is wrong" and not a test for particular actions. Adopting a rule against theft clearly has more favorable consequences than unfavorable consequences for everyone. The same is true for moral rules against lying or murdering. Rule-utilitarianism, then, offers a three-tiered method for judging conduct. A particular action, such as stealing my neighbor's lawn furniture, is judged wrong since it violates a moral rule against theft. In turn, the rule against theft is morally binding because adopting this rule produces favorable consequences for everyone.

Rule-utilitarianism attempts to avoid some of the problems with act-utilitarianism. For example, with act-utilitarianism it seems that we should have to give up television for charity work if it was determined that each of our leisure moments would yield greater social benefit if we did charity work instead. With rule-utilitarianism, though, a rule a rule prohibiting leisure time is not socially beneficial; hence we are not required to abandon leisure for charity. Similarly, under rule-utilitarianism, enslaving someone would be morally wrong if it was determined that a general rule prohibiting slavery was more socially beneficial. Even if a particular act of enslaving someone produced more benefit for the slave owners than disbenefit for the slave himself, the act would still be wrong since it would violate the rule prohibiting slavery. But by side-stepping the problems of act-utilitarianism, rule-utilitarianism creates a new problem: it is conceivable that, on balance, a rule permitting slavery actually produces more benefit for society.

The Internet Encyclopedia of Philosophy

Russian Philosophy

- TABLE OF CONTENTS:

A. Overview of the Problem.

The very notion of Russian philosophy poses a cultural-historical problem. No consensus exists on which works it encompasses and which authors made decisive contributions. To a large degree, a particular ideological conception of Russian philosophy, of what constitutes its essential traits, has driven the choice of inclusions. In turn, the various conceptions have led scholars to locate the start of Russian philosophy at different moments and with different individuals. Among the first to deal with this issue was T. Masaryk, a student of Brentano's and later the first president of the newly formed Czechoslovakia. Masaryk, following the lead of a pioneering Russian scholar E. Radlov (1854-1928), held that Russian thinkers have historically given short shrift to epistemological issues in favor of ethical and political discussions. For Masaryk, even those who were indebted to Kant's ethical teachings, scarcely understood and appreciated his epistemological criticism, which they viewed as essentially subjectivistic. True, Masaryk does comment that the Russian mind is "more inclined" to mythology than the Western European, a position that could lead us to conclude that he viewed the Russian mind as in some way innately different from others. However, he makes clear that the Russian predilection for unequivocal acceptance or total negation of a viewpoint stems, at least to a large degree, from the native Orthodox faith. Church teachings had "accustomed" the Russian mind to accept doctrinaire revelation without criticism. For this reason Masaryk certainly placed the start of Russian philosophy no earlier than the 19th century with the historiosophical musings of P. Chaadaev (1794-1856), who not surprisingly also

pinned blame for the country's position in world affairs on its Orthodox faith.

Others, particularly ethnic Russians, alarmed by what they took to be Masaryk's implicit denigration of their intellectual character have denied that Russian philosophy suffered from a veritable absence of epistemological inquiry. For N. Lossky (1870-1965) Russian philosophers admittedly have, as a rule, sought to relate their investigations, regardless of the specific concern, to ethical problems. This together with a prevalent epistemological view that externality is knowable--and indeed through an immediate grasping or intuition--has given Russian philosophy a form distinct from much of modern Western philosophy. Nevertheless, the relatively late emergence of independent Russian philosophical thought was a result of the medieval "Tatar yoke" and of the subsequent cultural isolation of Russia until Peter the Great's opening to the West. Even then Russian thought remained heavily indebted to developments in Germany until the emergence of 19th century Slavophilism with I. Kireyevsky (1806-56) and A. Khomiakov (1804-60).

Even more emphatically than Lossky, V. Zenkovsky (1881-1962) denied the absence of epistemological inquiry in Russian thought. In his eyes, Russian philosophy rejected the primacy accorded, at least since Kant, to the theory of knowledge over ethical and ontological issues. A widespread, though not unanimous, view among Russian philosophers, according to Zenkovsky, is that knowledge plays but a secondary role in human existential affairs. Yet, whereas many Russians historically have advocated such an ontologism, it is by no means unique to that nation. More characteristic of Russian philosophy, for Zenkovsky, is its anthropocentrism, i.e., a concern with the human condition and humanity's ultimate fate. For this reason, philosophy in Russia has historically been expressed in terms noticeably different from those in the West. Furthermore, like Lossky, Zenkovsky saw the comparatively late development of Russian philosophy as a result of the country's isolation and subsequent infatuation with Western modes of thought until the nineteenth century. Thus, although Zenkovsky placed Kireyevsky only at the "threshold" of a mature, independent "Russian philosophy" (understood as a system), the former believed it possible to trace the first independent stirrings back to G. Skovoroda (1722-94), who, strictly speaking, was the first Russian philosopher.

Largely as a result of rejecting the primacy of epistemology and the Cartesian model of methodological inquiry, Lossky, and Zenkovsky even more, included within "Russian philosophy" figures whose views would hardly qualify for inclusion within contemporary Western treatises in the history of philosophy. During the Soviet period, Russian scholars appealed to the Marxist doctrine linking intellectual thought to the socio-economic base for their own rather broad notion of philosophy. Any attempt at confining their history to what passes for professionalism today in the West was simply dismissed as "bourgeois." In this way, such literary figures as Dostoyevsky and Tolstoy were routinely included in texts, though just as routinely condemned for their own supposedly bourgeois mentality. Western studies devoted to the history of Russian philosophy have largely since their emergence acquiesced in this acceptance of a broad understanding of philosophy. F. Copleston, for example, conceded that "for historical reasons" philosophy in Russia tended to be informed by a socio-political orientation. Such an apology for his book-length study can be seen as somewhat self-serving, since he recognizes that philosophy as a theoretical discipline never flourished in Russia. Likewise, A. Walicki fears viewing the history of Russian philosophy from the contemporary Western technical standpoint would result in an impoverished picture populated with wholly unoriginal authors. Obviously, one cannot write a history of some discipline if that discipline lacks content!

Of those seemingly unafraid to admit the historical poverty of philosophical thought in Russia, G. Shpet

stands out not only for his vast historical erudition but also because of his own original philosophical contributions. Shpet, almost defiantly, characterized the intellectual life of Russia as rooted in an "elemental ignorance." Unlike Masaryk, however, Shpet did not view this dearth as stemming from Russia's Orthodox faith but from his country's linguistic isolation. The adopted language of the Bulgars lacked a cultural and intellectual tradition. Without a heritage by which to appreciate ideas, intellectual endeavors were valued for their utility alone. Although the government saw no practical benefit in it, the Church initially found philosophy useful as a weapon to safeguard its position. This toleration extended no further, and certainly the clerical authorities countenanced no divergence or independent creativity. With Peter the Great's governmental reforms, the state saw the utility of education and championed those and only those disciplines that served a bureaucratic and apologetic function. After the successful military campaign against Napoleon, many young Russian officers had their first experience of Western European culture and returned to Russia with incipient revolutionary ideas that in a relatively short time found expression in the abortive Decembrist Uprising of 1825. Finally, towards the end of the 1830s a new group, a "nihilistic intelligentsia," appeared that preached a toleration of cultural forms, including philosophy, but only insofar as they served the "people." Such was the fate of philosophy in Russia that it was virtually never viewed as anything but a tool or weapon and had to incessantly demonstrate this utility on fear of losing its legitimacy. Shpet concludes that philosophy as knowledge, as being of value for its own sake, was never given a chance.

Regardless of the date from which we place the start of Russian philosophy and its first practitioner--and we will have more to say on this topic as we go--few would dispute the religious orientation of Russian thought prior to Peter the Great and that professional secular philosophy arose comparatively recently in the country's history. If we are to avoid a double standard, one for "Western" thought and another for Russian, which is not merely self-serving but also condescending, we must examine the historical record for indisputable instances of philosophical thought that would be recognized as such regardless of where they originated. Although our inclusions, omissions and evaluations, on the whole, may more closely resemble those of Shpet than, say, Lossky, we thereby need not invoke any metaphysical historical scheme to justify them.

How precisely to subdivide the history of Russian philosophy has also been a subject of some controversy. In his pioneering study from 1898, A. Vvedensky (see below), Russia's foremost neo-Kantian, found three periods up to his time. Of course, in light of 20th century events his list must be revisited, reexamined and expanded. We can readily discern five periods in Russian philosophy, the last of which is still too recent to characterize. Unlike as in most major nations, specific extra-philosophical, viz., political, events clearly played a major if not the sole cause in terminating a period.

B. *Historical Periods*

1. *The Period of Philosophical Remarks (ca. 1755-1825)*

Although one can find scattered remarks of a philosophical nature in Russian writings before the mid-eighteenth century, these are, at best, of marginal interest to the professionally trained philosopher. For the most part these remarks were not intended to stand as rational arguments in support of a position. Even in the ecclesiastic academies, the thin scholastic veneer of the accepted texts was merely a traditional schematic device, a relic from the time when the only appropriate texts available were Western. For whatever reason only with the opening of the nation's first university in Moscow in 1755 do we see the emergence of something resembling philosophy, as we use that term today. Even then, however, the floodgates did not burst wide open. The first occupant of the chair of philosophy, N. Popovsky (1730-1760), was more suited to the teaching of poetry and rhetoric, to which chair he was

shunted after one brief year.

Sensing the dearth of adequately trained native personnel, the government invited two Germans to the university, thus initiating a practice that would continue well into the next century. The story of the first ethnic Russian to hold the professorship in philosophy for any significant length of time is itself indicative of the precarious existence of philosophy in Russia for much of its history. Having already obtained a magister's degree in 1760 with a thesis entitled "Rassuzhdenie o bessmertii dushi chelovechoj" ("A Treatise on the Immortality of the Human Soul"), Dmitry Anichkov (1733-1788) submitted in 1769 a dissertation on natural religion that was found to contain atheistic opinions and was subjected to an 18 year (!) investigation. Legend has it that the dissertation was publicly burned, although there is no firm evidence for this. As was common at the time, Anichkov used Wolffian philosophy manuals and during his first years taught in Latin.

Another notable figure at this time was S. Desnitsky (~1740-1789), who taught jurisprudence at Moscow University. Desnitsky attended university in Glasgow, where he studied under Adam Smith and became familiar with the works of Hume. The influence of Smith and British thought in general is evident in memoranda from February 1768 that Desnitsky wrote on government and public finance. Some of these ideas, in turn, appeared virtually verbatim in a portion of Catherine the Great's famous Nakaz, or Instruction, published in April of that year.

Also in 1768 appeared Ya. Kozelsky's *Filosoficheskie predlozhenija* (*Philosophical Propositions*), an unoriginal but noteworthy collection of numbered statements on a host of topics, not all of which were philosophical in a technical narrow sense. By his own admission the material dealing with "theoretical philosophy" was drawn from the Wolffians, primarily Baumeister, and that dealing with "moral philosophy" from the French Enlightenment thinkers, primarily Rousseau, Montesquieu and Helvetius. The most interesting feature of the treatise is its acceptance of a social contract, of an eight-hour workday, the explicit rejection of great disparities of wealth and its silence on religion as a source of morality. Nevertheless, in his "theoretical philosophy" Kozelsky (1728-1795) rejected atomism and the Newtonian conception of the possibility of empty space.

During Catherine's reign, plans were made to establish several universities in addition to that in Moscow. Of course, nothing came of these. Moscow University itself had a difficult time attracting a sufficient number of students, most of whom came from poorer families. Undoubtedly given the state of the Russian economy and society the virtually ubiquitous attitude was that the study of philosophy was a sheer luxury with no utilitarian value. In terms of general education the government evidently concluded that sending students abroad offered a better investment than spending large sums at home where the infrastructure needed much work and time to develop. Unfortunately, although there were some who returned to Russia and played a role in the intellectual life of the country, many more failed to complete their studies for a variety of reasons including falling into debt. Progress, however, skipped a beat in 1796 when Catherine's son and successor Paul ordered the recall of all Russian students studying abroad.

Despite its relatively small number of educational institutions, Russia felt a need to invite foreign scholars to help staff these establishments. One of the scholars, J. Schaden (1731-97), ran a private boarding school in Moscow in addition to teaching philosophy at the university. The most notorious incident from these early years, however, involves the German Ludwig Mellman, who in the 1790s introduced Kant's thought into Russia. Mellman's advocacy found little sympathy even among his colleagues at Moscow University, and in a report to the Tsar the public prosecutor charged Mellman with

"mental illness." Not only was Mellman dismissed from his position, but he was forced to leave Russia as well.

Under the initiative of the new Tsar, Alexander I, two new universities were opened in 1804 and with them the need for adequately trained professors again arose. Once more the government turned to Germany, and with the dislocations caused by the Napoleonic Wars Russia stood in an excellent position to reap an intellectual harvest. Unfortunately, many of these invited scholars left little lasting impact on Russia thought. For example, one of the most outstanding, Johann Buhle (1763-1821), had already written a number of works on the history of philosophy before taking up residence in Moscow. Yet, once in Russia his literary output plummeted, and his ignorance of the local language certainly did nothing to extend his influence.

Nonetheless, the sudden influx of German scholars, many of whom were intimately familiar with the latest philosophical developments, acted as an intellectual tonic on others. The arrival of the Swiss physicist Franz Bronner (1758-1850) at the new University of Kazan may have introduced Kant's epistemology to the young future mathematician Lobachevsky. The Serb physicist A. Stoikovich (1773-1832), who taught at Kharkov University, prepared a text for class use in which the content was arranged in conformity with Kant's categories. One of the earliest Russian treatments of a philosophical topic, however, was A. Lubkin's two "Pis'ma o kriticheskoj filosofii" ("Letters on Critical Philosophy") from 1805. Lubkin (1770/1-1815), who at the time taught at the Petersburg Military Academy, criticized Kant's theory of space and time for its agnostic implications saying that we obtain our concepts of space and time from experience. Likewise, in 1807 a professor of mathematics at Kharkov University, T. Osipovsky (1765-1832), delivered a subsequently published speech "O prostranstve i vremeni" ("On Space and Time"), in which he questioned whether, given the various considerations, Kant's position was the only logical conclusion possible. Assuming the Leibnizian notion of a preestablished harmony, we can uphold all of Kant's specific observations concerning space and time without concluding that they exist solely within our cognitive faculty. Osipovsky went on to make a number of other perceptive criticisms of Kant's position, though Kant's German critics already voiced many of these during his lifetime.

In the realm of social and political philosophy, as understood today, the most interesting and arguably the most sophisticated document from the period of the Russian Enlightenment is A. Kunitsyn's *Pravo estestvennoe* (*Natural Law*). In his summary text consisting of 590 sections, Kunitsyn (1783-1840) clearly demonstrated the influence of Kant and Rousseau, holding that rational dictates concerning human conduct form moral imperatives, which we feel as obligations. Since each of us possesses reason, we must always be treated morally as ends, never as means toward an end. In subsequent paragraphs, Kunitsyn elaborated his conception of natural rights including his belief that among these rights is freedom of thought and expression. His outspoken condemnation of serfdom, however, is not one that the Russian authorities could either have missed or passed over. Shortly after the text reached their attention all attainable copies were confiscated, and Kunitsyn himself was dismissed from his teaching duties at St. Petersburg University in March 1821.

Another scholar associated with St. Petersburg University was Aleksandr I. Galich (1783-1848). Sent to Germany for further education, he there became acquainted with Schelling's thought. With his return to Russia in 1813 he was appointed adjunct professor of philosophy at the Pedagogical Institute in St. Petersburg, and when in 1819 it was transformed into a university Galich was named to the chair of philosophy. His teaching career, however, was short-lived, for in 1821 Galich was charged with atheism

and revolutionary sympathies. Although stripped of teaching duties, he continued to draw a full salary until 1837. Galich's importance lays not so much in his own quasi-Schellingian views as his pioneering treatments of the history of philosophy, aesthetics and philosophical anthropology. His two-volume *Istorija filosofskikh sistem* (*History of Philosophical Systems*) from 1818-19 concluded with an exposition of Schelling's position and contained quite probably the first discussion in Russian of Hegel and, in particular, of his *Science of Logic*. Galich's *Opyt nauki izjashchnogo* (*An Attempt at a Science of the Beautiful*) from 1825 is certainly among the first Russian treatises in aesthetics. For Galich the beautiful is the sensuous manifestation of truth and as such is a sub-discipline within philosophy. His 1834 work *Kartina cheloveka* (*A Picture of Man*) marked the first Russian foray into philosophical anthropology. For Galich all "scientific" disciplines, including theology, are in need of an anthropological foundation, and, moreover, such a foundation must recognize the unity of the human aspects and functions be they corporeal or spiritual.

The increasing religious and political conservativism that marked Tsar Alexander's later years imposed onerous restrictions on the dissemination of philosophy both in the classroom and in print. By the time of the Tsar's death in 1825, most reputable professors of philosophy had already been administratively silenced or cowed into compliance. At the end of that year the aborted coup known as the Decembrist Uprising, many of whose leaders had been exposed to the infection of Western European thought, only hardened the basically anti-intellectual attitude of the new Tsar Nicholas. Shortly after I. Davydov (1792/4-1863), hardly either an original or a gifted thinker, had given his introductory lecture "O vozmozhnosti filosofii kak nauki" ("On the Possibility of Philosophy as Science") in May 1826 as professor of philosophy at Moscow University, the chair was temporarily abolished and Davydov shifted to teaching mathematics.

2. *The Philosophical Dark Age (ca. 1825-1860)*

The reign of Nicholas I (1825-1855) was marked by intellectual obscurantism and an enforced philosophical silence, unusual even by Russian standards. The Minister of Public Education, A. Shishkov, blamed the Decembrist Uprising explicitly on the contagion of foreign ideas. To prevent their spread he and Nicholas's other advisors restricted the access of non-noble youths to higher education and had the tsar enact a comprehensive censorship law that held publishers legally responsible even after the official censor's approval of a manuscript. Yet the scope of this new "cast-iron statute" was conceived so broadly that even at the time it was remarked that the Lord's Prayer could be interpreted as revolutionary speech. Prevented an outlet in a dedicated professional manner at the universities, philosophy found energetic though amateurish expression first in the faculties of medicine and physics and then later in fashionable salons and social gatherings, where discipline, rigor and precision were held of little value. During these years, those empowered to teach philosophy at the universities struggled with the task of justifying the very existence of their discipline not in terms of a search for truth, but as having some social utility. Given the prevailing climate of opinion, this proved to be a hard sell. The news of revolutions in Western Europe in 1848 was the last straw. All talk of reform and social change was simply ruled impermissible, and travel beyond the Empire's borders was forbidden. Finally, in 1850, the minister of education took the step that was thought too extreme in the 1820s: To protect Russia from the latest philosophical systems--and therefore intellectual infection--the teaching of philosophy in public universities was simply to be eliminated. Logic and psychology were permitted but only in the safe hands of theology professors. This situation persisted until 1863, when in the aftermath of the humiliating Crimean War philosophy reentered the public academic arena. Even then, however, severe restrictions on its teaching persisted until 1889!

Nevertheless, despite the oppressive atmosphere some independent philosophizing emerged during the Nicholas years. True, at first Schelling's influence dominated abstract discussions, particularly those concerning the natural sciences and their place vis-a-vis the other academic disciplines. However, the two chief Schellingians of the era, D. Vellansky (1774-1847) and M. Pavlov (1793-1840), both valued German Romanticism more for its sweeping conclusions than for either its arguments or as the logical outcome of a philosophical development that had begun with Kant. Though both Vellansky and Pavlov penned a considerable number of works, none of them would find a place within today's philosophy curriculum. Slightly later, in the 1830s and '40s, the discussion turned to Hegel's system, again with great enthusiasm but with little understanding either with what Hegel actually meant or the philosophical backdrop of his writings. Not surprisingly Hegel's own self-described "voyage of discovery," the *Phenomenology of Spirit*, remained an unknown text. Suffice it to say that but for the dearth of original competent investigations at this time, the mere mention of the Stankevich and the Petrashevsky circles, the Slavophiles and the Westernizers, etc. in a history of philosophy text would be regarded a travesty.

Nevertheless, amid the darkness of official obscurantism there were a few brief glimmers of light. In his 1833 *Vvedenie v nauku filosofii* (*Introduction to the Science of Philosophy*) F. Sidonsky (1805-1873) treated philosophy as a rational discipline independent of theology. Although conterminous with theology, Sidonsky regarded philosophy as both a necessary and a natural searching of the human mind for answers that faith alone cannot adequately supply. By no means did he take this to mean that reason and faith conflict. Revelation provides the same truths but the path taken, though dogmatic and therefore rationally unsatisfying, is considerably shorter. Much more could be said about Sidonsky's introductory text, but both it and its author were quickly consigned to the margins of history. Notwithstanding his book's desired recognition in some secular circles, Sidonsky soon after its publication was shifted first from philosophy to the teaching of French and then simply dismissed from the St. Petersburg Ecclesiastic Academy in 1835. This time it was the clerical authorities who found his book, it was said, insufficiently rigorous from the official religious standpoint. Sidonsky spent the next 30 years, that is, until the re-introduction of philosophy in the universities, as a parish priest in the Russian capital.

Among those who most resolutely defended the autonomy of philosophy during this "Dark Age" were O. Novitsky (1806-1884) and I. Mikhnevich (1809-1885), both of whom taught for a period at the Kiev Ecclesiastic Academy. Although neither was a particularly outstanding thinker and left no enduring works on the perennial philosophical problems, both stand out for refusing simply to subsume philosophy to religion or politics. Novitsky in 1834 accepted the professorship in philosophy at the new Kiev University, where he taught until the government's abolition of philosophy, after which he worked as a censor. Mikhnevich, on the other hand, became an administrator.

One of the most interesting pieces of philosophical analysis from this time came from another Kiev scholar, S. Gogotsky (1813-1889). In his undergraduate thesis "Kriticheskij vzgljad na filosofiju Kanta" ("A Critical Look at Kant's Philosophy") from 1847, Gogotsky approached his topic from a moderate and informed Hegelianism, unlike that of his more vocal but dilettantish contemporaries. For Gogotsky, Kant's thought represented a distinct improvement over the positions of empiricism and rationalism. However, his advocacy of such ideas as that of the uncognizability of things in themselves, the rejection of the real existence of things in space and time, the sharp dichotomy between moral duty and happiness, etc. demonstrated his own extremism. During this "Dark Age," Gogotsky continued at Kiev University but taught pedagogy and remained silent on philosophical issues.

From our standpoint today one of the most important characteristics of the philosophizing of the early

"Kiev School" is the stress placed on the history of Western philosophy and particularly on epistemology. Mikhnevich, for example, wrote, "philosophy is the Science of consciousness...of the subject and the nature of our consciousness." Based on statements such as this, some (A.Vvedensky, A. Nikolsky) have seen the influence of Fichte.

The teaching of philosophy at this time was not eliminated from the ecclesiastic academies, the separate institutions of higher education parallel to the secular universities for those from a clerical background. Largely with good reason, the government felt secure about their political and intellectual passivity. Among the most noteworthy of the professors at an ecclesiastic academy during the Nicholaevan years was F. Golubinsky (1798-1854), who taught in Moscow. Generally recognized as the founder of the "Moscow School of Theistic Philosophy," his historical importance lies solely in his unabashed subordination of philosophy to theology and epistemology to ontology. For Golubinsky, humans seek knowledge in an attempt to recover an original diremption, a lost intimacy with the Infinite! Nevertheless, the idea of God is felt immediately within us. Owing to this immediacy, there is no need for and cannot be a proof of God's existence. Such was the tenor of "philosophical" thought in the religious institutions of the time.

At the very end of the "Dark Age" one figure--the Owl of Minerva or was it a phoenix?--emerged who combined the scholarly erudition of his Kiev predecessors with the dominating "ontologism" of the theistic apologists, such as Golubinsky. P. Jurkevich (1826-1874) stood with one foot in the Russian philosophical past and one in the future. Serving as the bridge between the eras, he largely defined the contours along which philosophical discussions would be shaped for the next two generations.

3. *The Emergence of Russian Professional Philosophy (ca. 1860-1917)*

While a professor of philosophy at the Kiev Ecclesiastic Academy, Jurkevich in 1861 caught the attention of a well-connected publisher with a long essay in the obscure house organ of the Academy attacking Chernyshevsky's materialism and anthropologism, which at the time were all the rage among Russia's youth. Having decided to re-introduce philosophy to the universities, the government, nevertheless, worried lest a limited and controlled measure of independent thought get out of hand. The decision to appoint Jurkevich to the professorship at Moscow University, it was hoped, would serve the government's ends while yet combating fashionable radical trends.

In a spate of articles from his last three years in Kiev, Jurkevich forcefully argued in support of a number of seemingly disconnected theses but all of which demonstrated his own deep commitment to a Platonic idealism. His most familiar stance, his rejection of the popular materialism of the day, was directed not actually at metaphysical materialism but at a physicalist reductionism. Among the points Jurkevich made was that no physiological description could do justice to the revelations offered by introspective psychology and that the transformation of quantity into quality occurred not in the subject, as the materialists held, but in the interaction between the object and the subject. Jurkevich did not rule out the possibility that necessary forms conditioned this interaction, but, in keeping with the logic of this notion, he ruled out an uncognizable "thing in itself" conceived as an object without any possible subject.

Although Jurkevich already presented the scheme of his overall philosophical approach in his first article "Ideja" ("The Idea") from 1859, his last, "Razum po ucheniju Platona i opyt po ucheniju Kanta" ("Plato's Theory of Reason and Kant's Theory of Experience"), written in Moscow, is today his most readable work. In it he concluded, as did Spinoza and Hegel before him, that epistemology cannot serve as first philosophy, i.e., that a body of knowledge need not and, indeed, cannot begin by asking for the

conditions of its own possibility. In Jurkevich's best-known expression: "In order to know it is unnecessary to have knowledge of knowledge itself." Kant, he held, conceived knowledge not in the traditional, Platonic sense as knowledge of what truly is, but in a radically different sense as knowledge of the universally valid. Hence, for Kant, the goal of science was to secure useful information, whereas for Plato science secured truth.

Unfortunately, Jurkevich's style prevented a greater dissemination of his views. In his own day, his unfashionable views, cloaked as they were in scholastic language with frequent allusions to scripture, hardly endeared him to a young, secular audience. Jurkevich remained largely a figure of derision at the university. Today, it is these same qualities, together with his failure to elucidate his argument in distinctly rational terms, that make studying his writings both laborious and unsatisfying. In terms of immediate impact, he had only one student--Vladimir Solovyov. Yet, notwithstanding his meager direct impact Jurkevic's Christian Platonism proved deeply influential until at least the Bolshevik Revolution.

Unlike Jurkevich, P. Lavrov (1823-1900), a teacher of mathematics at the Petersburg Military Academy, actively aspired to a university chair in philosophy, viz., the one in the capital when the position was restored in the early 1860s. However, the government apparently already suspected Lavrov of questionable allegiance and, despite a recommendation from a widely respected scholar (K. Kavelin), awarded the position instead to Sidonsky.

In a series of lengthy essays written when he had university aspirations, Lavrov developed a position, which he termed "anthropologism," that opposed metaphysical speculation, including the then-fashionable materialism of left-wing radicalism. Instead, he defended a simple epistemological phenomenalism that at many points bore a certain similarity to Kant's position though without the latter's intricacies, nuances and rigor. Essentially, Lavrov maintained that all claims regarding objects are translatable into statements about appearances or an aggregate of them. Additionally, he held that we have a collection of convictions concerning the external world, convictions whose basis lies in repeated experiential encounters with similar appearances. The indubitability of consciousness and our irresistible conviction in the reality of the external world are fundamental and irreducible. The error of both materialism and idealism fundamentally in the mistaken attempt to collapse one into the other. Since both are fundamental, the attempt to prove either is ill-conceived from the outset. Consistent with this skepticism, Lavrov argued that the study of "phenomena of consciousness," a "phenomenology of spirit," could be raised to a science only through introspection, a method he called "subjective." Likewise, the natural sciences, built on our firm belief in the external world, need little support from philosophy. To question the law of causality, for example, is, in effect, to undermine the scientific standpoint.

Parallel to the two principles of theoretical philosophy, Lavrov spoke of two principles underlying practical philosophy. The first is that the individual is consciously free in his worldly activity. Unlike for Kant, however, this principle is not a postulate but a phenomenal fact; it carries no theoretical implications. For Lavrov, the moral sphere is quite autonomous from the theoretical. The second principle is that of "ideal creation." Just as in the theoretical sphere we set ourselves against a real world, so in the practical sphere we set ourselves against ideals. Just as the real world is the source of knowledge, the world of our ideals serves as the motivation for action. In turning our own image of ourselves into an ideal, we create an ideal of personal dignity. Initially, the human individual conceives dignity along egoistic lines. In time, however, the individual's interaction, including competition, with others gives rise to his conception of them as having equal claims to dignity and to rights. In linking rights to human dignity, Lavrov thereby denied that animals have rights.

Of a similar intellectual bent, N. Mikhailovsky (1842-1904) was even more of a popular writer than Lavrov. Nevertheless, Mikhailovsky's importance in the history of Russian philosophy lies in his defense of the role of subjectivity in human studies. Unlike the natural sciences, the aim of which is the discovery of objective laws, the human sciences, according to Mikhailovsky, must take into account the epistemologically irreducible fact of conscious, goal-oriented activity. While not disclaiming the importance of objective laws, both Lavrov and Mikhailovsky held that the social scientist must introduce a subjective, moral evaluation into his analyses. Unlike the natural scientist, the social scientist recognizes the malleability of the laws under his investigation.

Comtean positivism, which for quite some years enjoyed considerable attention in 19th century Russia, found its most resolute and philosophically notable defender in V. Lesevich (1837-1905). Finding that it lacked a scientific grounding, Lesevich believed that positivism needed an inquiry into the principles that guide the attainment of knowledge. Such an inquiry must take for granted some body of knowledge without simply identifying itself with it. To the now-classic Hegelian charge that such a procedure amounted to not venturing into the water before learning how to swim, Lesevich replied that what was sought was not how to swim but, rather, the conditions that make swimming possible. In this vein he consciously turned to the Kantian model while remaining highly critical of any talk of an a priori. In the end, Lesevich drew heavily upon psychology and empiricism for establishing the conditions of knowledge, thus leaving himself open to the charge of psychologism and relativism.

As the years passed, Lesevich moved from his early "critical realism," which abhorred metaphysical speculation, to an appreciation for the positivism of Avenarius and Mach. However, this very abhorrence, which was decidedly unfashionable, as well as his political involvement somewhat limited his influence. Undoubtedly, of the philosophical figures to emerge in the 1870s, indeed arguably in any decade, the greatest was V. Solovyov (1853-1900). In fact, if we view philosophy not as an abstract, independent inquiry but as a more or less sustained intellectual conversation, then we can precisely date the start of Russian secular philosophy--24 November 1874, the day of Solovyov's defense of his magister's dissertation, *Krizis zapadnoj filosofii* (*The Crisis of Western Philosophy*). For only from that day forward do we find a sustained discussion within Russia of philosophical issues considered on their own terms, that is, without overt appeal to their extra-philosophical ramifications, such as their religious or political implications.

Concerning Solovyov, I will limit myself here to a few lines. After completion and defense of his magister's dissertation, Solovyov penned a highly metaphysical treatise entitled "Filosofskie nachala tsel'nogo znanija" ("Philosophical Principles of Integral Knowledge"), which he never completed. However, at approximately the same time he also worked on what became his doctoral dissertation, *Kritika otvlechennykh nachal* (*Critique of Abstract Principles*). the very title suggesting a Kantian influence. Although originally intended to consist of three parts, one each covering ethics, epistemology and aesthetics, the completed work omitted the latter. For more than a decade Solovyov remained silent on philosophical questions, preferring instead to concentrate on topical issues. When his interest was rekindled in the 1890s in preparing a second edition of his *Kritika*, a recognition of a fundamental shift in his views led him to recast their systemization in the form of an entirely new work, *Opravdanie dobra* (*The Justification of the Good*). Presumably, he intended follow up his ethical investigations with respective treatises on epistemology and aesthetics. Unfortunately, Solovyov died having completed only three brief chapters of the "Theoretical Philosophy."

Solovyov's most relentless philosophical critic was B. Chicherin (1828-1904), certainly one of the most

remarkable and versatile figures in Russian intellectual history. Despite his sharp differences with Solovyov, Chicherin himself accepted a modified Hegelian standpoint in metaphysics. Although viewing all of existence as rational, the rational process embodied in existence unfolds "dialectically." Chicherin, however, parted with the traditional triadic schematization of the Hegelian dialectic, arguing that the first moment consists of an initial unity of the one and the many. The second and third moments, paths or steps are antithetical and take various forms in different spheres, such as matter and reason or universal and particular. The final moment is a fusion of the two into a higher unity.

In the social and ethical realm, Chicherin placed great emphasis on individual human freedom. Social and political laws should strive for morally neutrality, permitting the flowering of individual self-determination. In this way, he remained a staunch advocate of economic liberalism, seeing essentially no role for government intervention. The government itself had no right to use its powers either to aim at a moral ideal or to force its citizens to seek an ideal. On the other hand, the government should not use its powers to prevent the citizenry from the exercise of private morality. Despite receiving less treatment than the negative conception of freedom, Chicherin, nevertheless, upheld the idealist conception of positive freedom as the striving for moral perfection and in this way reaching the Absolute.

Another figure to emerge in the late 1870s and 1880s was the neo-Leibnizian A. Kozlov (1831-1901), who taught at Kiev University and who called his highly developed metaphysical stance "panpsychism." As part of this stance, he, in contrast to Hume, argued for the substantial unity of the Self or I, which makes experience possible. This unity he held to be an obvious fact. Additionally, rejecting the independent existence of space and time, Kozlov held that they possessed being only in relation to thinking and sensing creatures. Like Augustine, however, Kozlov believed that God viewed time as a whole without our divisions into past, present and future. To substantiate space and time, to attribute an objective existence to either, begs an answer to where and when to place them. Indeed, the very formulation of the problem presupposes a relation between a substantiated space or time and our selves. Lastly, unlike Kant, Kozlov thought all judgments are analytic.

An unfortunately largely neglected figure to emerge in this period was M. Karinsky (1840-1917), who taught philosophy at the St. Petersburg Ecclesiastic Academy. Unlike many of his contemporaries, Karinsky devoted much of his attention to logic and an analysis of arguments in Western philosophy, rather than metaphysical speculation. Unlike his contemporaries, Karinsky came to philosophy with an analytical bent rather than with a literary flair--a fact that made his writing style often decidedly torturous. True to those schooled in the Aristotleian tradition, Karinsky, like Brentano, to whom he has been compared, held that German Idealism was essentially irrationalist. Arguing against Kant, Karinsky believed that our inner states are not merely phenomenal, that the reflective self is not an appearance. Inner experience, unlike outer, yields no distinction between reality and appearance. In his general epistemology, Karinsky argued that knowledge was built on judgments, which were legitimate conclusions from premises. Knowledge, however, could be traced back to a set of ultimate unprovable, yet reliable, truths, which he called "self-evident." Karinsky argued for a pragmatic interpretation of realism, saying that something exists in another room unperceived by me means I would perceive it if I were to go into that room. Additionally, he accepted an analogical argument for the existence of other minds similar to that of Mill and Russell.

In his two-volume magnum opus *Polozhitel'nye zadachi filosofii* (*The Positive Tasks of Philosophy*), L. Lopatin (1855-1920), who taught at Moscow University, defended the possibility of metaphysical knowledge, claiming that empirical knowledge is limited to appearances, whereas metaphysics yields

knowledge of the true nature of things. Although Lopatin saw Hegel and Spinoza as the definitive expositors of rationalistic idealism, he rejected both for their very transformation of concrete relations into rational or logical ones. Nevertheless, Lopatin affirmed the role of reason particularly in philosophy in conscious opposition to, as he saw it, Solovyov's ultimate surrender to religion. In the first volume, he attacked materialism as itself a metaphysical doctrine that elevates matter to the status of an absolute that cannot explain the particular properties of individual things or the relation between things and consciousness. In his second volume, Lopatin distinguishes mechanical causality from "creative causality," according to which one phenomenon follows another, though with something new added to it. Despite his wealth of metaphysical speculation, quite foreign to most contemporary readers, Lopatin's observations on the self or ego derived from speculation that is not without some interest. Denying that the self has a purely empirical nature, Lopatin emphasized that the undeniable reality of time demonstrated the non-temporality of the self, for temporality could only be understood by that which is outside time. Since the self is extra-temporal, it cannot be destroyed, for that is an event in time. Likewise, in opposition to Solovyov, Lopatin held that the substantiality of the self is immediately evident in consciousness.

In the waning years of the 19th century, neo-Kantianism came to dominate German philosophy. Because of the increasing tendency to send young Russian graduate students to Germany for additional training, it should come as no surprise that that movement gained a foothold in Russia too. In one of the very few Russian works devoted to philosophy of science A. Vvedensky (1856-1925) presented, in his lengthy dissertation, a highly idealistic Kantian interpretation of the concept of matter as understood in the physics of his day. He tried therein to defend and update Kant's own work as exemplified in the *Metaphysical Foundations of Natural Science*. Vvedensky's book, however, attracted little attention and exerted even less influence. Much more widely recognized were his own attempts in subsequent years, while teaching at St. Petersburg University, to recast Kant's transcendental idealism in, what he called, "logicism." Without drawing any conclusions based upon the nature of space and time, Vvedensky believed it possible to prove the impossibility of metaphysical knowledge and, as a corollary so to speak, that everything we know, including our own self, is merely an appearance, not a thing in itself. Vvedensky was also willing to cede that the time and the space in which we experience everything in the world are also phenomenal. Although metaphysical knowledge is impossible, metaphysical hypotheses, being likewise irrefutable, can be brought into a world-view based on faith. Particularly useful are those demanded by our moral tenets such as the existence of other minds.

The next two decades saw a blossoming of academic philosophy on a scale hardly imaginable just a short time earlier. Most fashionable Western philosophies of the time found adherents within the increasingly professional Russian scene. Even Nietzsche's thought began to make inroads, particularly among certain segments of the artistic community and among the growing number of political radicals. Nonetheless, few, particularly during these formative years, adopted any Western system without significant qualifications. Even those who were most receptive to foreign ideas adapted them in line with traditional Russian concerns, interests and attitudes. One of these traditional concerns was with Platonism in general. Some of Plato's dialogues appeared in a Masonic journal as early as 1777, and we can easily discern an interest in Plato's ideas as far back as the medieval period. Possibly the Catholic assimilation of Aristotelianism had something to do with the Russian Orthodox Church's emphasis on Plato. And again possibly this interest in Plato had something to do with the metaphysical and idealistic character of much classic Russian thought as against the decidedly more empirical character of many Western philosophies. We have already noted the Christian Platonism of Jurkevich, and his student Solovyov,

who with his central concept of "vseedinstvo" ("total-unity") can, in turn, also be seen as a modern neo-Platonist.

In the immediate decades preceding the Bolshevik Revolution, a veritable legion of philosophers worked in Solovyov's wide shadow. Among the most prominent of these was S. Trubetskoi (1862-1905). The Platonic strain of his thought is evident in the very topics Trubetskoi chose for his magister's and doctoral theses: *Metaphysics in Ancient Greece*, 1890 and *The History of the Doctrine of Logos*, 1900 respectively. It is, however, in his programmatic essays "O prirode chelovecheskovo soznanija" ("The Nature of Human Consciousness"), 1889-1891 and "Osnovanija idealizma" ("The Foundations of Idealism"), 1896 that Trubetskoi elaborated his position vis-a-vis modern philosophy. Holding that the basic problem of contemporary philosophy is whether human knowledge is of a personal nature, Trubetskoi maintained that modern Western philosophers relate personal knowledge to a personal consciousness. Herein lies their error. Human consciousness is not an individual consciousness, but, rather, an on-going universal process. Likewise, this process is a manifestation not of a personal mind but of a cosmic one. Personal consciousness, as he puts it, presupposes a collective consciousness, and the latter presupposes an absolute consciousness. Kant's great error was in conceiving the transcendental consciousness as subjective. In the second of the essays mentioned above, Trubetskoi claims that there are three means of knowing reality: empirically through the senses, rationally through thought, and directly through faith. For him, faith is what convinces us that there is an external world, a world independent of my subjective consciousness. It is faith that underlies our accepting the information provided by our sense organs as reliable. Moreover, it is faith that leads me to think there are in the world other beings with a mental organization and capacity similar to mine. However, Trubetskoi rejects equating his notion of faith with the passive "intellectual intuition" of Schelling and Solovyov. For Trubetskoi, faith is intimately connected with the will, which is the basis of my individuality. My discovery of the other is grounded in my desire to reach out beyond myself, i.e., to love.

Although generally characterized as a neo-Leibnizian, N. Lossky (1870-1965) was also greatly influenced by a host of Russian thinkers including Solovyov and Kozlov. In addition to his own views, Lossky, having studied at Bern and Goettingen among other places, is remembered for his pioneering studies of contemporary German philosophy. He referred to Husserl's *Logical Investigations* already as early as 1906, and in 1911 he gave a course on Husserl's "intentionalism." Despite this early interest in strict epistemological problems, Lossky in general drew ever closer to the ontological concerns and positions of Russian Orthodoxy. He termed his epistemological views "intuitivism," believing that the cognitive subject apprehends the external world as it is in itself directly. Nevertheless, the object of cognition remains ontologically transcendent, while epistemologically immanent. This direct penetration into reality is possible, Lossky tells us, because all worldly entities are interconnected into an "organic whole." Additionally, all sensory properties of an object, e.g., its color, texture, temperature, etc., are actual properties of the object, our sense stimulation serving merely to direct our mental attention to those properties. That different people see one object in different ways is explained as a result of different ways individuals have of getting their attention directly towards one of the object's numerous properties. All entities, events and relations that lack a temporal and spatial character possess "ideal being" and are the objects of "intellectual intuition." Yet, there is another, a third, realm of being that transcends the laws of logic (here we see the influence of Lossky's teacher, Vvedensky), which he calls "metalogical being" and is the object of mystical intuition.

Another kindred spirit was S. Frank (1877-1950), who in his early adult years was involved with Marxism and political activities. His magister's thesis *Predmet znanija* (*The Object of Knowledge*), 1915,

is notable as much for its masterful handling of current Western philosophy as for its overall metaphysical position. Demonstrating a grasp not only of German neo-Kantianism, Frank drew freely from, among many others, Bergson, Husserl, and Scheler and possibly may have been the first in Russian to refer to Frege, whose Foundations of Arithmetic Frank calls "one of the rare genuinely philosophical works by a mathematician." Frank contends that all logically determined objects are possible thanks to a metalogical unity, which is itself not subject to the laws of logic. Likewise all logical knowledge is possible thanks solely to an "intuition," an "integral intuition," of this unity. Such intuition is possible because all of us are part of this unity or Absolute. In a subsequent book *Nepostizhimoe* (*The Unknowable*), 1939, Frank further elaborated his view stating that mystical experience reveals the supra-logical sphere in which we are immersed but which cannot be conceptually described. Although there is a great deal more to Frank's thought, we see that we are quickly leaving behind the secular, philosophical sphere for the religious, if not mystical.

No survey, however brief, of Russian thinkers under Solovyov's influence would be satisfactory without mention of the best known of these in the West, namely N. Berdjaev (1874-1948). Widely hailed as a Christian existentialist, he began his intellectual journey as a Marxist. However, by the time of his first publications he was attempting to unite a revolutionary political outlook with transcendental idealism, particularly a Kantian ethic. Within the next few years Berdjaev's thought evolved quickly decisively away from Marxism and away from critical idealism to an outright Orthodox Christian idealism. On the issue of free will versus determinism, Berdjaev moved from an initial acceptance of soft determinism to a resolute incompatibilist. Morality, he claimed, demanded his stand. Certainly, Berdjaev was among the first, if not the first, philosopher of his era to diminish the importance of epistemology in place of ontology. In time, however, he himself made clear that the pivot of his thought was not the concept of Being, as it would be for some others, and even less that of knowledge, but, rather, the concept of freedom. Acknowledging his debt to Kant, Berdjaev too saw science as providing knowledge of phenomenal reality but not of actuality, of things as they are in themselves. However applicable the categories of logic and physics may be to appearances, they are assuredly inapplicable to the noumenal world and, in particular, to God. In this way Berdjaev does not object to the neo-Kantianism of Vvedensky, for whom the objectification of the world is a result of functioning of the human cognitive apparatus, but only that it does not go far enough. There is another world or realm, namely one characterized by freedom.

Just as all of the above figures drew inspiration from Christian neo-Platonism, so too did they all feel the need to address the Kantian heritage. Lossky's dissertation *Obosnovanie intuitivizma* (*The Foundations of Intuitivism*), for example, is an extended engagement with Kant's epistemology, Lossky himself having prepared a Russian translation of the "First Critique" comparable in style and adequacy to Kemp Smith's rendering into English. Trubetskoi called Kant the "Copernicus of modern philosophy", who "discovered that there is an a priori precondition of all possible experience." Nevertheless, among the philosophers of this era not all saw transcendental idealism as a springboard to religious and mystical thought. A student of Vvedensky's, I. Lapshin (1870-1952) in his dissertation, *Zakony myshlenija i formy poznanija* (*The Laws of Thought and the Forms of Cognition*), 1906, attempted to show that, contrary to Kant's stand, space and time were categories of cognition and that all thought, even logical, relies on a categorical synthesis. Consequently, the laws of logic are themselves synthetic, not analytic, as Kant had thought and are applicable only within the bounds of possible experience.

G. Chelpanov (1863-1936), who taught at Moscow University, was another with a broadly conceived Kantian stripe. Remembered as much, if not more so, for his work in experimental psychology as in

philosophy, Chelpanov, unlike many others, wished to retain the concept of the thing-in-itself, seeing it as that which ultimately "evokes" a particular representation of an object. Without it, contended Chelpanov, we are left (as in Kant) without an explanation of why we perceive this, and not that, particular object. In much the same manner, we must appeal to some transcendent space in order to account for why we see an object in this spot and not another. For these reasons Chelpanov called his position "critical realism" as opposed to the more usual construal of Kantianism as "transcendental idealism." In psychology, Chelpanov upheld Wundt's psychophysical parallelism.

As the years of the First World War approached, a new generation of scholars came to the fore who returned to Russia from graduate work in Germany broadly sympathetic to one or even an amalgam of the schools of neo-Kantianism. Among these young scholars the works of B. Kistjakovsky (1868-1920) and P. Novgorodtsev (1866-1924) stand out as, arguably, the most accessible today for their analytic approach to questions of social-science methodology.

During this period, Husserlian phenomenology was introduced into Russia from a number of sources, but its first and, in a sense, only major propagandist was G. Shpet (1879-1937), whom we have referred to earlier. In any case, besides his historical studies Shpet did pioneering work in hermeneutics as early as 1918. Additionally, in two memorable essays he respectively argued, along the lines of the early Husserl and the late Solovyov, against the Husserlian view of the transcendental ego and in the other traced the Husserlian notion of philosophy as a rigorous science back to Parmenides.

Regrettably, Shpet was permanently silenced during the Stalinist era, but A. Losev (1893-1988), whose early works fruitfully employed some early phenomenological techniques, survived and blossomed in its aftermath. Concentrating on ancient Greek thought, particularly aesthetics, his numerous publications have yet to be assimilated into world literature, although during later years his enormous contributions were recognized within his homeland and by others to whom they were linguistically accessible. It must be said, nonetheless, that Losev's personal pronouncements hark back to a neo-Platonism completely at odds with the modern temperament.

4. *Russian Philosophy during the Soviet Era (1917-1991)*

The Bolshevik Revolution of 1917 ushered in a political regime with a set ideology that countenanced no intellectual competition. During the first few years of its existence, Bolshevik attention was directed towards consolidating political power, and the selection of university personnel in many cases was left an internal matter. In 1922, however, most explicitly non-Marxist philosophers who had not already fled were banished from the country. Many of them found employment, at least for a time, in the major cities of Europe and continued their personal intellectual agendas. None of them, however, during their lifetimes significantly influenced philosophical developments either in their homeland or in the West and few, with the notable exception of Berdyaev, received wide recognition.

During the first decade of Bolshevik rule the consuming philosophical question concerned the role of Marxism vis-a-vis traditional academic disciplines, particularly those that had either emerged since Marx's death or had seen recent breathtaking developments that had reshaped the field. The best known dispute occurred between the "mechanists" and the "dialecticians" or "Deborinists," after its principal advocate A. Deborin (1881-1963). Since a number of individuals composed both groups and the issues in dispute evolved over time, no simple statement of the respective stances can do complete justice to either. Nevertheless, the mechanists essentially held that philosophy as a separate discipline had no raison d'etre within the Soviet state. All philosophical problems could and would be resolved by the

natural sciences. The hallowed dialectical method of Marxism was, in fact, just the scientific method. The Deborinists, on the other hand, defended the existence of philosophy as a separate discipline. Indeed, they viewed the natural sciences as built on a set of philosophical principles. Unlike the mechanists, they saw nature as fundamentally dialectical, which could not be reduced to simpler mechanical terms. Even human history and society proceeded dialectically in taking leaps that resulted in qualitatively different states. The specifics of the controversy, which raged until 1929, are of marginal philosophical importance now, but to some degree the basic issue of the relation of philosophy to the sciences, of the role of the former vis-a-vis the latter, endures to this day. Regrettably, politics played as much of a role in the course of the dispute as abstract reasoning, and the outcome was a simple matter of a political fiat with the Deborinists gaining a temporary victory. Subsequent events over the next two decades, such as the defeat of the Deborinists, have nothing to do with philosophy. What philosophy did continue to be pursued during these years within Russia was kept a personal secret, any disclosure of which was at the expense of one's life. To a certain degree, the issue of the role of philosophy arose again in the 1950s when the philosophical implications of relativity theory became a disputed subject. Again, the issue arose of whether philosophy or science had priority. This time, however, with atomic weapons securely in hand there could be no doubt as to the ultimate victor with little need for political intervention.

Another controversy, though less vociferous, concerned psychological methodology and the very retention of such common terms as consciousness, psyche and attention. The introspective method, as we saw advocated by many of the idealistic philosophers, was seen by the new ideologues as subjective and unscientific in that it manifestly referred to private phenomena. I. Pavlov (1849-1936), already a star of Russian science at the time of the Revolution, was quickly seen as utilizing a method that subjected psychic activity to the objective methods of the natural sciences. The issue became, however, whether the use of objective methods would eliminate the need to invoke such traditional terms as consciousness. The central figure here was V. Bekhterev (1857-1927), who believed that since all mental processes eventually manifested themselves in objectively observable behavior, subjective terminology was superfluous. Again, the discussion was silenced through political means once a victory was secured over the introspectionists. Bekhterev's behaviorism was itself found to be dangerously leftist.

As noted above, during the 1930s and '40s independent philosophizing virtually ceased to exist, and what little was published is of no more than historical interest. Indicative of the condition of Russian thought at this time is the fact that when in 1946 the government decided to introduce logic into the curriculum of secondary schools the only suitable text available was a slim book by Chelpanov dating from before the Revolution. After Stalin's death a relative relaxation or "thaw" in the harsh intellectual climate was permitted, of course within the strict bounds of the official state ideology. In addition to the re-surfacing of the old issue of the role of Marxism with respect to the natural sciences, Russian scholars sought a return to the traditional texts in hopes of understanding the original inspiration of the official philosophy. Some, such as the young A. Zinoviev (1922-) sought an understanding of "dialectical logic" in terms of the operations, procedures and techniques employed in political economics. Others, for example, V. Tugarinov, drew heavily on Hegel's example in attempting to delineate a system of fundamental categories.

After the formal recognition in the validity of formal logic, it received significant attention in the ensuing years by Zinoviev, D. Gorsky, E. Voishvillo among many others. Their works have deservedly received international attention and made no use of the official ideology. What sense, if any, to make of "dialectical logic" was another matter that could not remain politically neutral. Until the last days of the Soviet period, there was no consensus as to what it is or its relation to formal logic. One of the most

resolute defenders of dialectical logic was E. Ilyenkov, who has received attention even in the West. In epistemology too, surface agreement, demonstrated through use of an official vocabulary obscured but did not quite hide differences of opinion concerning precisely how to construe the official stand. It certainly now appears that little of enduring worth in this field was published during the Soviet years. However, some philosophers who were active at that time produced works that only recently have been published. Perhaps the most striking example is M. Mamardashvili (1930-1990), who during his lifetime was noted for his deep interest in the history of philosophy and his anti-Hegelian stands.

Most work in ethics in the Soviet period took a crude apologetic form of service to the state. In essence, the good is that which promotes the stated goals of Soviet society. Against such a backdrop, Ja. Mil'ner-Irinin's study *Etika ili printsy istinnoj chelovechnosti* (*Ethics or The Principles of a True Humanity*) is all the more remarkable. Although only an excerpt appeared in print in the 1960s, the book-length manuscript, which as a whole was rejected for publication, was circulated and discussed. The author presented a normative system that he held to be universally valid and timeless. Harking back to the early days of German Idealism, Mil'ner-Irinin urged being true to one's conscience as a moral principle. However, he claimed he deduced his deontology from human social nature rather than from the idea of rationality, as in Kant.

After the accession of L. Brezhnev to the position of General Secretary and particularly after the events that curtailed the Prague Spring in 1968 all signs of independent philosophizing beat a speedy retreat. The government anxiously launched a campaign for ideological vigilance, which a German scholar, H. Dahm, termed an "ideological counter-reformation," that persisted until the "perestroika" of the Gorbachev years.

5. *Post-Soviet Era (1991-)*

Clearly, the dissolution of the Soviet Union and the relegation of the Communist Party to the political opposition has also ushered in a new era in the history of Russian philosophy. What trends will emerge is still too early to tell. How Russian philosophers will eventually evaluate their own recent as well as tsarist past may turn, to a large degree, on the country's political and economic fortunes. Not surprisingly, the 1990s saw, in particular, a "re-discovery" of the previously forbidden works of the religious philosophers active just prior to or at the time of the Bolshevik Revolution. Whether Russian philosophers will continue along these lines or approach a style resembling Western "analytical" trends remains an open question.

C. *Concluding Remarks*

In the above historical survey we have emphasized Russian epistemological over ontological and ethical concerns hopefully without neglecting or disparaging them. Admittedly, doing so may reflect a certain "Western bias." Nevertheless, such a survey, whatever its deficiencies, shows that questions regarding the possibility of knowledge have never been completely foreign to the Russian mind. This we can unequivocally state without dismissing Masaryk's position, for indeed during the immediate decades preceding the 1917 Revolution epistemology was not accorded special attention, let alone priority. Certainly at the time when Masaryk formulated his position Russian philosophy was relatively young. Nonetheless, were the non-critical features of Russian philosophy, which Masaryk so correctly observed, a reflection of the Russian mind as such or were they a reflection of the era observed? If one were to view 19th century German philosophy from the rise of Hegelianism to the emergence of neo-Kantianism, would one not see it as shortchanging epistemology? Could it not be that our error lay in focussing on a single period in Russian history, albeit the philosophically most fruitful one? In any case, the mere

existence of divergent opinions during the Soviet era--however cautiously these had to be expressed--on recurring fundamental questions testifies to the tenacity of philosophy on the human mind.

Rather than ask for the general characteristics of Russian philosophy, should we not ask why philosophy arose so late in Russia compared to other nations? Was Vvedensky correct that the country lacked suitable educational institutions until relatively recently, or was he writing as a university professor who saw no viable alternative to make a living? Could it be that Shpet was right in thinking that no one found any utilitarian value in philosophy except in modest service to theology, or was he merely expressing his own fears for the future of philosophy in an overtly ideological state? Did Masaryk have grounds for linking the late emergence of philosophy in Russia to the perceived anti-intellectualism of Orthodox theology, or was he simply speaking as a Unitarian. Finally, intriguing as this question may be, are we not in searching for an answer guilty of what some would label the mistake of reductionism, i.e., of trying to resolve a philosophical problem by appeal to non-philosophical means?

Earl of Shaftesbury
Anthony Ashley Cooper (1671-1713)

Life and Writings.Anthony Ashley Cooper was the grandson of the first Earl of Shaftesbury. He was Locke's patron, and was himself educated under Locke's supervision. His weak health prevented him from following an active political career, and his life was mainly devoted to intellectual interests. After two or three unhappy years of school life at Winchester, he traveled abroad, chiefly in Italy, with a tutor. In early adulthood he lived in Holland, and in later life his health drove him to Italy once more. He was an ardent student of the classics, especially of Plato, Epictetus, and Marcus Aurelius, a devotee of liberty of thought, and an amateur of art. His writings, penned between 1701 and 1712, were published in three volumes titled *Characteristicks of Men, Manners, Opinions, Times* (1711); a revised and enlarged edition was ready at the time of his death in 1713. The essays include "A Letter Concerning Enthusiasm," "Sensus Communis, an essay on the Freedom of Wit and Humor," "Soliloquy, or Advice to an Author," "An Inquiry Concerning Virtue and Merit," "The Moralist, a Philosophical Rhapsody," Miscellaneous Reflections on the said Treatises, and other critical Subjects," A Notion of the Historical Draught or Tablature of the Judgment of Hercules, with a Letter concerning Design." The most important of these is "An Inquiry Concerning Virtue and Merit." He comments that the miscellaneous style of the collection was in vogue in his day.

Religious Enthusiasm. The *Characteristics* opens with remarks on "Enthusiasm" and on "Wit and Humor". Regarding religious enthusiasts (or fanatics), he tells us that "vapors naturally rise," and he would dispel them by ridicule. "The melancholy way of treating religion is that which, according to my apprehension, renders it so tragical, and is the occasion of its acting in reality such dismal tragedies in the world." He would "recommend wisdom and virtue in the way of pleasantry and mirth," and

tells us that "good-humor is not only the best security against enthusiasm, but the best foundation of piety and true religion>" It does not appear very clearly what is the nature of the piety and religion which he would recommend. Sometimes he seems to scoff at Biblical passages, and at all their spiritual verities and holy mysteries; at other times he makes it appear as if he wished to be considered a believer in Christianity. There is, however, latent levity in the profession he makes: "We may in a proper sense be said faithfully and dutifully to embrace those holy mysteries even in their minutest particulars, and without the least exception on account of their amazing depth." This suffices to assure us of our own "steady orthodoxy, resignation, and entire submission to the truly Christian and catholic doctrines of our holy church, as by law established."

Innate Ideas. Shaftesbury has largely caught the spirit of Locke, but he by no means follows him, especially in his rejection of innate ideas. "Twas Mr. Locke that struck at all fundamentals, threw all order and virtue out of the world, and made the ideas of these, which are the same with those of God, unnatural, and without foundation in our minds. *Innate* is a word he poorly plays upon: the right word, though less used, is *connatural*." He shows that there are many of our mental qualities natural to us. "Life, and the sensations which accompany life, come when they will, are from mere nature and nothing else. Therefore, if you dislike the word innate, let us change it, if you will, for instinct, and call instinct that which nature teaches, exclusive of art, culture, or discipline." Beginning with these lower affections, he goes on to show that "preconceptions of a higher kind have place in human kind, preconceptions of the 'fair and beautiful.'"

He reviews Descartes' "I think therefore I am," and argues that nothing is more certain: "for the Ego or I being established in the first part of the proposition, the Ergo, no doubt, must hold it good in the latter." However, he adds, "For my own part, I take my being upon trust." He continually appeals to the "Sensus Communis," or Common Sense, and his general doctrine is thus expressed: "Some moral and philosophical truths there are withal so evident in themselves, that it would be easier to imagine half mankind too have run mad, and joined precisely in one and the same species of folly, than to admit any thing as truth which should be advanced against such *natural knowledge, fundamental reason*, and *common sense*." He allows

that what is natural to us may require labor and pains to bring it out.

Selfish and Social Affections. Shaftesbury's moral theory targets the account of selfish-based conduct as found in Hobbes and, more implicitly in Locke. He concedes that we do indeed have affections in us which have regard to our own interest or happiness; they included,

> **love of life, resentment of injury, pleasure, or appetite towards nourishment and the means of generation; interest, or the desire of those conveniences by which we are well provided for or maintained; emulation, or love of praise and honor; indolence, or love of ease and rest.**

However, these lead only to "the good of the private," and are not the natural foundation for virtue. Like Butler later argues, there are also social (or "natural") affections which are directed to the good of the species to which we belong. He argues that there is no conflict between the two systems. It is not merely that there are social as well as self-regarding impulses or affections, but that the system of human nature as a whole points to the subordination of the self-regarding affections in favor of the social affections as the essential feature of the "natural" or virtuous life. This is because the means to our good is placed in a network of relations to our fellow humans. Indeed, our natural affections stretch even further: we take in the universe so that we will love all things that exist in the world. For, in the universal design of things, "nothing is supernumerary or unnecessary", and "the whole is harmony, the numbers entire, the music perfect."

Contrary to those such as Hobbes and Mandeville who seek to found virtue on self-interest, Shaftesbury argues that

> **Whoever looks narrowly into the affairs of it, will find that passion, humor, caprice, zeal, faction, and a thousand other springs which are counter to self-interest, have as considerable a part in the movement of this machine. There are more wheels and counterpoises in this engine than are easily imagined.**

Virtue consists in the proper exercise of these two classes of affections (the selfish and social). Vice arises when the public affections are weak and deficient, when the private affections are too strong, or affections spring up which do not tend to the support of the public or private system. He holds that virtue, as consisting in these affections, is natural to humans, and that he who practices it is obeying the ancient Stoic maxim, and living according to nature. The virtues which he recommends fall far beneath the stern standard of the Stoics, and leave out all the peculiar graces of Christianity. They consist of, "a mind subordinate to reason, a temper humanized and fitted to all natural affection, an exercise of friendship uninterrupted, thorough candor, benignity, and good nature, with constant security, tranquillity, equanimity.

In spite of his insistence upon the harmony of virtue and self-interest, or of the self-regarding with the social affections, Shaftesbury is convinced that the good is not pleasure. "When Will and Pleasure are synonymous; when everything which pleases us is called pleasure, and we never chuse or prefer but as we please, 'tis trifling to say, 'Pleasure is our good.' For this has as little meaning as to say, 'We chuse what we think eligible'; and, 'We are pleased with what delights or pleases us.' The question is, Whether we are rightly pleased, and chuse as we should do" (*Characteristics* 2:226-227). The good is not mere satisfaction or pleasure, but that which satisfies a person *as* a human.

Shaftesbury's great objection to the theological ethics of Locke and of popular opinion is that it destroys the reality and disinterestedness of virtue. Action inspired by the motive of reward or punishment is, because self-interested, not truly virtuous. Not until a person "is come to have any affection towards what is morally good, and can like or affect such good *for its own sake*, as good and amiable *in itself*," can that person be called "good or virtuous" (*Characteristics* 2:66). The appeal to self-interest by rewards and punishments may be a means of moral education used by God, as it is used by parents and guardians and by the state. But its aim must be to educate us to the disinterested love of virtue and supreme Goodness. Similarly, to make virtue dependent upon the will of God is to destroy the very idea of virtue, and to make the inference to supreme Goodness impossible. "For how can Supreme Goodness be intelligible to those who

know not what Goodness itself is? Or how can virtue be understood to deserve reward, when as yet its merit and excellence are unknown? We begin surely at the wrong end, when we would prove merit by favour, and order by a Deity" (*Characteristics*, 2:267). The alternative between a theological and an independent theory of ethics is, he holds, the alternative between ethical nominalism and realism. Shaftesbury's own view is that virtue is "really something in itself and in the nature of things: not arbitrary or factitious... constituted from without, or dependent on custom, fancy, or will: not even on the Supreme Will itself, which can no way govern it: but being necessarily good, is governed by it, and ever uniform with it" (*Loc. cit.*).

The Moral Sense. Shaftesbury is aware that the question of the character of the virtuous act is not the same as that of the mental faculty which looks at it and appreciates it. Natural to us is a "sense of right and wrong," to which Shaftesbury gives the name "the moral sense." This moral sense apprehends the beauty or deformity, the proportion or disproportion, of actions and affections.

> **"It feels the soft and harsh, the agreeable and disagreeable, in the affections; and finds a foul and fair, a harmonious and a dissonant, as really and truly here, as in any musical numbers, or in the outward forms or representations of sensible things. Nor can it withhold its admiration and extasy, its aversion and scorn, any more in what relates to one than to the other of these subjects" (*Characteristics* 2:83).**

This faculty of the moral sense he represents as a kind of sense organ. Locke describes two types of senses, the external and the internal (and from these tries to derive all our ideas or perceptions). In Shaftesbury, two internal senses occupy an important place: the sense of beauty and the moral sense:

> **No sooner does the eye open upon figures, the ear to sounds, than straight the Beautiful results, and grace and harmony are known and acknowledged. No sooner are actions viewed, no sooner the human affections and passions discerned (and they are most of them as soon discerned as felt), than straight an *inward* eye distinguishes and sees the *fair* and *shapely*, the *amiable* and**

> ***admirable*, apart from the *deformed*, the *foul*, the *odious*, or the *despicable***

Although this advances beyond Locke's discussion of the senses in the *Essay*, he is anxious to connect his view of the moral sense with Locke's account of the inward sense.

IEP

Gustav Shpet (1879-1937)

Shpet, a professor of philosophy at the University of Moscow, introduced Husserlian transcendental phenomenology into Russia. Additionally, he wrote extensively on aesthetics, hermeneutics, the history of Russian philosophy and the philosophy of language. During the Stalinist years in Russia he was condemned as being an idealist in philosophy and a counter-revolutionary in politics. The depth and breadth of his numerous studies stand as a testament to the philosophic spirit in Russia during the waning years of tsarism.

LIFE. Gustav Gustavovich Shpet was born in Kiev in April 1879. Late in life during the Stalinist period, he sought to emphasize his humble origins as the illegitimate son of a seamstress. In fact, his maternal grandfather appears to have been a member of the Polish gentry. No information is available on his father. Whether he had any religious upbringing is unclear. On his university registration form he gave his religion as Lutheran, although his mother was, based on family testimony, Catholic.

Upon finishing studies at a gymnasium (secondary school) in Kiev Shpet enrolled at the university there in 1898. Also at this time he became involved in a Marxist circle, although the degree of his active participation is unclear. In any case, his involvement resulted in expulsion from the university. After a relatively short time, however, he was permitted back to attend classes. From that time onward, Shpet always maintained a respectable distance from philosophical Marxism, while apparently retaining a measured sympathy for its socio-economic ideals. After finishing his studies in 1906 he taught for a time at a Kiev gymnasium but followed his former teacher Georgij Chelpanov to Moscow in 1907 upon the latter's succession to the philosophy chair formerly held by Sergej Trubeckoj.

In Moscow Shpet continued his studies at the university and worked in Chelpanov's newly established psychology institute. In addition, he taught at a number of educational institutions in the city. During the summer months of 1910 and 1911 Shpet went abroad to Paris, Edinburgh and various locales in Germany in connection with the psychology institute and his own research for a dissertation. During one of these trips he first encountered Husserl, but it was not until his stay in Goettingen during the 1912-13 academic year that he came firmly under Husserl's influence. Attending Husserl's lectures and seminars at this time, Shpet became acquainted with the nascent ideas of transcendental phenomenology and, in particular, with those that would eventually become known as *Ideen II*. When *Ideen I* was published in 1913 Shpet amazingly mastered in short order the change in Husserl's orientation. The next several years were arguably the most philosophically productive of his life, producing in rapid succession a series of works on epistemology, the history of philosophy and the history of Russian philosophy. In 1915 he wrote a large study of the 19th century Moscow philosophy professor Pamfil Yurkevich, followed the next year by the defense and the publication of his dissertation *Istorija kak problema logika* (*History as a Problem of Logic*) and then the writing of *Germenevtika i ee problemy* (*Hermeneutics and Its*

Problems), which languished in manuscript for decades.

His work, however, as the first propagandist, if you will, in Russia for Husserl's transcendental phenomenology and philosophy as a rigorous science is perhaps that for which he is best known, at least in Western philosophical circles. Although the Husserlian influence waned over the years, due at least in part to his increasing isolation within Soviet Russia, Shpet produced within a few short months of its appearance in 1913 the first book-length study of Husserl's *Ideen I*. In 1917 and 1918 he edited the philosophical yearbook *Mysl' i slovo*, which also contained valuable contributions by Shpet himself and amplified his own position vis-a-vis Husserlian phenomenology. In 1918 he was appointed to a professorship at Moscow University and in the following year he succeeded to the chair held by Leo Lopatin, who had recently died.

Despite his varied intellectual activities on many fronts during the early years of the Bolshevik regime, Shpet, as an openly non-Marxist intellectual, could not be permitted to retain his teaching position long. His name appeared on Lenin's August 1922 listing of those to be exiled from Russia, a list that included numerous prominent philosophers, such as Berdyaev, Lossky and Lapshin. Shpet, however, successfully appealed to Lunacharskij, the Soviet cultural minister, with whom he was acquainted from his student days in Kiev, to have his name removed.

In 1923 with the creation of the Russian--later State--Academy for Cultural Studies, Shpet was tapped to be its vice-president. There he continued his scholarly work, albeit slightly redirected or, perhaps more accurately, re-focused away from pure philosophy. Again despite his prolific output and that of his colleagues, the Academy, though at least nominally headed by a Marxist, was closed in 1929. Over the next several years he made his living chiefly by preparing translations from such authors as Dickens and Byron, and he also participated in the preparation of a Russian edition of Shakespeare.

On 14 March 1935 Shpet, along with several other former colleagues from the State Academy, was arrested, charged with anti-soviet activities and sentenced to five years internal exile. Later that year the place of exile was changed to Tomsk, a university city in Siberia, where Shpet prepared a new Russian translation of Hegel's *Phenomenology of Spirit*. On 27 October 1937 he was again arrested and charged with belonging to a monarchist organization. Recently uncovered documents from the former KGB headquarters in Tomsk indicate that Shpet was executed on 16 November 1937.

PHILOSOPHY. The nascent secondary literature is still at a very early stage. Nevertheless, already three areas of disagreement exist concerning: a) the influences on Shpet's philosophy; b) the number of stages in the development of his thought; and c) Shpet's lasting contribution to philosophy. With regard to the first area, some have tended to emphasize the phenomenological aspect of his thought and, consequently, have stressed the Husserlian influence. Others have noted the influence of Hegel, while still others have sought to demonstrate Shpet's indebtedness to the Russian metaphysical tradition. To a large degree, however, the depiction of the dominant influence on Shpet has been determined by one's response to the third area, viz. his contribution to philosophy. During the Soviet era, Russian scholars saw Shpet almost exclusively as an historian of Russian philosophy. To the extent that his ideas at that time received recognition in the West he was viewed as the Russian disciple of Husserl. Today both inside Russia and in Western circles Shpet is receiving attention as a phenomenologist of language, if not the first to study language from within a broadly phenomenological perspective.

In any case, Shpet's philosophical development can be broken into at least three periods. Although

one contemporary scholar (A. Haardt) holds the first of these to range from 1898-1905, no writings have emerged from these very youthful years and certainly Shpet published nothing at this time. What little information we have comes from an autobiographical remark in his huge 1916 thesis. Thus, seeing his Marxist infatuation as a stage in Shpet's thought serves no useful purpose.

Whatever was the nature of his Marxism, already by 1903 Shpet felt an affinity toward idealism and, in particular, saw the former as riddled with what he thought were epistemological and methodological errors. In his thesis for Kiev University, published under the title "The Problem of Causality in Hume and Kant: Did Kant Answer Hume's Doubt?," Shpet writing under the unmistakable influence of Chelpanov and the "Kiev School of Kant-Interpretation," fundamentally sided with a phenomenalist reading of Kant. In addition, referring explicitly to the writings of the Baden School of neo-Kantianism, Shpet cautiously held that although Kant had demonstrated the "real necessity" of a priori cognitions, he had not proved their "logical necessity."

> **"We must recognize, therefore, that Kant succeeded in proving the real necessity of a priori categories. Nevertheless, he did not prove their logical necessity. " (1, p. 202)**

That is, the Kantian a priori categories, including causality, must be postulated so as to account for objectively valid knowledge. In this way Shpet accords belief in the categories, and thus practical reason, a primacy in and over epistemology. Therefore, based simply on the textual evidence available to the contemporary scholar for analysis, the first period in Shpet's thought is marked by a neo-Kantian phase extending from circa 1903-1912 and is the only period conceptually quite distinct from the others.

The exact evolution of Shpet's ideas immediately after moving to Moscow is unclear. What is clear, however, is that he irrevocably distanced himself from neo-Kantianism and came under the influence of Lopatin and the works of the recently deceased S. Trubeckoj. From them, as well perhaps as through his reading of Vladimir Solovyov, Shpet began to employ the unmistakeable terminology and think philosophically in the categories and problems of Platonism, particularly that variant then dominant at Moscow University. In addition to criticizing psychologism--and, indeed, all "isms"-- for its failure to grasp the psyche as a "living whole," Shpet began to see philosophy itself as based on the immediate data of reflection.

> **"The spirit of our philosophy is that of a living,concrete and integral philosophy based on the reliable data of inner experience. " (2, p.264.)**

Despite the obvious pedigree of this conception in, on the one hand, the Moscow metaphysicians, and, on the other, James, Dilthey, Stumpf and the early Husserl--as Shpet himself acknowledged--we should not disregard the fact that Chelpanov also stressed the importance of introspection as a technique in psychology, albeit bereft of metaphysical interpretation.

The next period in Shpet's philosophy is that for which he is best known. In *Appearance and Sense*, published in mid-1914, Shpet provided, on the one hand, a summarization of many points covered in Husserl's *Ideen I*. Yet, on the other hand, Shpet sought to invoke Husserl's transcendental turn for his own purposes, while cautiously noting what he saw as deficiencies in the latter. Like Husserl, Shpet was willing to characterize phenomenology as the fundamental science and, again like Husserl, Shpet made extensive use of eidetic intuition. This reliance on the Husserlian technique of "ideation" is one that Shpet continued to value years later even after coming under political attack for his idealism. Husserl and Shpet differed, however, on the goal of such procedures and methods. Whereas the former sought to construct a presuppositionless philosophy,

a "science" of consciousness and cognition, Shpet saw philosophy as ultimately a study of being, of which cognizing is but one form among many. Modern philosophy's error is found in its concentration on the forms of cognition, rather than on cognition as such. In modern parlance we could say philosophy has failed to distinguish the forest from the trees. The subject-matter of phenomenology, as Shpet conceived it, is the study of cognition, qua a mode of being. The major oversight of modern philosophy is not to have seen the non-empirical and non-actual nature of the cognizing subject.

Of the several articles Shpet published immediately subsequent to the appearance of *Appearance and Sense* two in particular stand out: "Consciousness and Its Proprietor" and "Wisdom or Reason." In the first of these, which appeared in 1916, Shpet already addressed an issue that would later prove to be a major bone of contention among the next generation of phenomenologists. Developing ideas enunciated by Solovyov during the last years of his life, Shpet asked who "owns" or "possesses" the unity of consciousness. Whereas he is willing, pace Hume, to concede on the issue of such a unity, it is no one's, i.e., it has no proprietor. We are led astray in seeking such a proprietor by an inaccurate analogy drawn from our everyday language.

> **"Ultimately, it is as impossible to say *whose* consciousness as it is to say *whose* space, *whose* air, even though everybody is convinced that the air which he breathes is *his* air, and the space which he occupies is *his* space. " (4, p. 205)**

In direct opposition to Husserl, whom he accuses of betraying the "principle of all principles," stated in *Ideen I*, Shpet finds no "pure Ego." What unity there is certainly cannot serve as an epistemological guarantee, and it certainly cannot be called a Self or an Ego.

In "Wisdom or Reason" from 1917 Shpet presents what may well be the first attempt to depict the phenomenological idea, or what we today often view as that idea, as the telos of Western philosophy. Noticeably, however, Shpet never mentions phenomenology as such; instead he uses the locution "philosophy as pure knowledge" and even "philosophy as knowledge." In a precise manner, Parmenides established the proper object of philosophy and showed the path along which philosophy is directed to solve the problem posed by that object. (5, p. 7)

This itself can be seen as a distancing from the Husserlian influence in that Shpet traces *his* conception back to the Greeks and indeed to Parmenides. In any case, Shpet holds that philosophy proceeds through three stages (and as in Hegel's *Phenomenology* whether these are purely logical or chronological as well is arguable): from wisdom then on to metaphysics before finally arriving at rigorous science or knowledge. Unlike positivistic "scientific philosophy," which seeks to copy the methodology of an arbitrarily chosen natural science or bases itself on results attained in natural science, philosophy as pure knowledge grounds the specific sciences.

The recent emergence and publication of Shpet's hitherto virtually inaccessible 1918 work *Hermeneutics and Its Problems*, in both the original Russian and a German translation, has drawn notable international attention. In it Shpet presents a history of hermeneutics ranging from the Greeks to the early 20th century, seeing the work of Dilthey and Husserl, as represented in the first "Logical Investigation," as the highest point yet attained.

Throughout this period and later Shpet maintained that his work was a continuation of that direction in philosophy associated with Brentano and Husserl. Where they erred was in forgetting the social dimension. There can and do exist forms of collective or socio-cultural consciousness. An element of such consciousness is language, more specifically words. The understanding plays an analogous role in the grasping of sense, for which words act as the "material bearer," as sense

perception does in the individual's representational consciousness. Shpet developed these themes at some length in his *Aesthetic Fragments* from 1922/23 and his *Inner Form of the Word* from 1927.

In addition, Shpet shortly before and after the Bolshevik Revolution devoted considerable attention to the history of Russian philosophy, publishing a number of valuable studies studded with numerous caustic comments on the poverty of philosophy in his homeland.

Ancient Greek Skepticism

Greek skepticism is usually divided into three periods: early Pyrrhonism (fourth and third centuries BCE.), Academic skepticism (third and second centuries BCE.), and post Academic skepticism (first through third centuries CE.).

Pyrrhonism. Early Pyrrhonism, represented by the teachings of Pyrrho of Elis and his student Timon, is noted as much for the life style or "agoge" of its two champions as for their specific teachings. Pyrrho is presented by Diogenes Laertius as a skeptic who is oblivious to all external objects and is saved from danger only by friends who steer him clear of "carts, precipices, dogs or what not." Philip Hallie challenges this portrayal and suggests instead that early Pyrrhonism is a eudemonean philosophy in the same class with Stoicism and Epicureanism. Pyrrho's intention was to recommend tranquility of mind by avoiding fanaticism concerning matters that cannot be proved. Although Timon's character was less tranquil than his teacher's, Hallie argues that he too was eudemonean by "being content to find happiness amongst the phenomena, and to laugh and rail at those who dared go beyond them." (*Sextus Empiricus*, 1985, p. 17).

Academic Skepticism. Greek skepticism became more formal with the skepticism of the Academy. A few generations after Plato, Arcesilaus, head of the academy, launched an attack on the Stoic theory of knowledge. The Stoics maintained that there were self-evidently true perceptions which reveal the logos and were not possible to doubt. Arcesilaus disputed this theory noting that people respect such claims to knowledge only when claimed by wise men, and not by fools. Since, however, there is no criteria for distinguishing wise men from fools, the whole question of self-evident principles is begged. His conclusion was that we should suspend judgment (*epoche*) on the question of truth. Carneades, who headed the Academy a century after Arcesilaus, continued the attack on Stoic epistemology. For Carneades, not only do we lack direct experience of self-evidently true perceptions and external objects, but those perceptions we have are subjective in character. Consequently, we do not know if even our best perceptions accurately copy external objects. The most we can say is that appearances lend themselves to varying degrees of probability (for example, the appearance of a door which does not open probably means that the door itself is locked).

Post Academic Skepticism. The Academic and Pyrrhonian traditions of skepticism each had proponents in the post Academic period. In his *Academica,* Cicero defends Academic skepticism about knowledge of objects against "dogmatic" philosophy, particularly Platonism, Aristotelianism, Stoicism and Epicureanism. From the Pyrrhonian camp, Aenesidemus is remembered for his formulation of the ten skeptical tropes, or techniques by which we doubt a contention. In *Greek Skepticism,* C.L. Stough sorts the ten tropes into two groups: one group showing that impressions cannot be compared to objects, and the other that we cannot know

objects independent of impressions. An example of the first group of tropes concerns the frequency or rarity with which an object appears. Since the astonishment or value of an object (such as a comet or a piece of gold) results from the rarity of its appearance, and has little to do with the nature of the objects themselves, we must suspend judgment about the nature of these objects.

Sextus begins his *Outlines of Pyrrhonism* by distinguishing between dogmatic, Academic and skeptical philosophies. Aristotle, Epicurus and the Stoics are dogmatic since they thought they had found truth. Academic philosophers, such as Carneades, are partially dogmatic since their notion of probability was an attempt gain access to inapprehensible objects. Skeptics, on the other hand, continue the search for truth and make neither dogmatic nor partially dogmatic claims. Like Pyrrho, Sextus believes the end of true skepticism is tranquility and the avoidance of any dogmatism; (consequently "Pyrrhonism" for Sextus is synonymous with skepticism).

Sextus adopts the following definition of skepticism:

> **Skepticism is an ability to place in antithesis, in any manner whatever, appearances and judgments, and thus-because of the equality of force in the objects and arguments opposed-come first of all to a suspension of judgment and then to mental tranquillity. (*Sextus Empiricus* 1985, pp. 32-33)**

Unique to Sextus' skepticism is that skepticism itself is something which ultimately requires the suspension of judgment. This is seen where he writes, "We may say that they [various formulations of skepticism] can be used to cancel themselves, since they are themselves included in those things to which they refer, just as purgative medicines not only remove the humours from the body but expel themselves together with the humours" (*Sextus Empiricus*, 1985, p. 86). Like his skeptical predecessors, Sextus concentrated heavily upon epistemological skepticism -- knowledge of external objects and the reliability of appearances. However, he also sets his skepticism loose on problems of causality, physical change, becoming and perishing, absolute rest, place and time.

Contemporary Skepticism

Arguments for Skepticism. In *The Skeptical Tradition* (1983), Burnyeat argues that from Pyrrho until Kant, skepticism had been following a tradition insofar as there was a "succession of thinkers whose thought [was] conditioned in one way or another by a knowledge of their predecessors in the line." After Kant, Burnyeat continues, skepticism became a free creation of the post-modern and contemporary imagination. Although there are exceptions to his claim, Burnyeat is accurate about most contemporary discussions of skepticism. Nevertheless, Grayling offers the following seminal notion of skepticism which is presumed by most contemporary discussions:

> **possibly (not P and E),**

where P stands for a proposition and E stands for the best evidence in support of P. For Grayling, the skeptic holds roughly that the best evidence we have in support of proposition P is logically consistent with the denial of P. This notion of skepticism may also be expanded to account for different varieties of skepticism. For example, the skeptic may be selective about which propositions are represented by P. This is sometimes called local skepticism. Or the skeptic may argue that P stands for *any*. proposition, and thus advances a total or global skepticism.

Many contemporary arguments favoring skepticism begin with a claim that "knowledge of P requires some condition C." Condition C is then shown to be unattainable. And from this, it is then argued that there can be no knowledge of P. To give some examples, according to Naess, condition C is that we have "some evidence for the truth of P." Condition C is denied, however, since there will always be evidence for some proposition inconsistent with P. Naess concludes not only that the skeptic has no knowledge of P, but, rather unusually, that the skeptic can still *pronounce* the expression "I know P" without actually *asserting* that he knows P (given a limited intention of his utterance). Similarly, Unger, in *Ignorance: a Case for Scepticism*, thinks that knowledge of P requires the condition that it is all right to be certain about P. Unger continues that it is never all right to be certain about P since this would involve being closed minded with respect to new evidence. Consequently, we can never know P. Unger concludes that this skepticism is the result of faulty expectations built into our linguistic system, and that ridding skepticism requires revamping these expectations. As a final example in this vein, Nathan argues in *Evidence and Assurance* that knowledge of P requires the condition of being "radically assured" about the truth of P (assurance gained from conscious and deliberate investigation). Given foundationalism, radical assurance is something we reasonably expect of knowledge, particularly with foundational or core beliefs. However, radical reassurance is something we are unlikely to attain, hence, we cannot know P.

The above style of skeptical argument allows the skeptic great flexibility in choosing a necessary, yet unattainable condition for knowledge. Other contemporary arguments for skepticism, though, follow a different model. For example, Vander Veer in *Philosophical Skepticism and Ordinary Language Analysis* attacks ordinary language philosophy for not having discredited skepticism. In

view of skeptical arguments on topics such as knowledge, other minds and induction, Vander Veer shows how responses by Austin, Strawson and Wittgenstein have not adequately met the skeptical challenge. This analysis, however, shows only that ordinary language philosophy is inadequate as a positive account of knowledge, not that skepticism is true. Perhaps the most Humean of the contemporary skeptics is Mates, who, in his book *Skeptical Essays*, shows that the traditional problems of philosophy are filled with contradictions. Such problems include the liar's paradox, Russell's paradox, as well as problems with freedom of the will and external objects. Unlike Hume, though, Mates is psychologically content with philosophical agnosticism.

Refutations of Skepticism. Some contemporary refutations of skepticism should be briefly noted. Kekes's *A Justification of Rationality* argues that the alleged solipsistic skeptic refutes himself by using expressions which presuppose perception of an intended referent. Rescher, in *Skepticism: a Critical Reappraisal* (1980) argues that the skeptic's philosophical or hyperbolic doubt is refuted by mundane experiences and use of language. In *Reason and Skepticism*, Slote argues that, in spite of the strength of many skeptical arguments, there are intuitively reasonable "principles of inference" which make skepticism less credible than belief in non- skeptical theories. Using a dozen of these principles, Slote shows that it is reasonable to believe in external objects, other minds, and a deity. Odegard's *Knowledge and Skepticism* argues for a middle ground between skepticism and dogmatism, that is "epistemological toleration," a view which admits the strength of many skeptical arguments, but recognizes that these skeptical views may all be false. The result is that we should merely "tolerate" claims to knowledge. Johnson's *Skepticism and Cognitivism* contains refutations of Naess and Unger, as presented above. Other attacks on skepticism are Cornmans *Skepticism, Justification and Explanation*, Klein's *Certainty: A Refutation of Scepticism* and Grayling's *The Refutation of Skepticism*.

Modern Skepticism

Since the publication of Popkin's *History of Skepticism*, the strong influence of Greek skepticism on modern philosophy is now an accepted fact. In this and other publications Popkin traces the impact of skepticism on modern philosophy from 16th century editions of Sextus Empiricus to its ultimate resolution in the writings of the "new Pyrrho": David Hume. With a half dozen publications of Sextus' writings in the 17th and 18th centuries, skepticism became a popular and important philosophical issue to the moderns. Many thinkers, particularly in France, carried the Pyrrhonian torch as passed to them through Sextus's writings. Included were Michel de Montaigne (who made specific use of the ten skeptical tropes of Aenesidemus), Pierre Charron, Petrus Gassendi (who is remembered for his critical letters to Descartes), Joseph Glanvill (who introduced Pyrrhonism to England), Walter Raleigh, Pierre-Daniel Huet, and, most significantly, Pierre Bayle. In his highly influential *Historical and Critical Dictionary*, Bayle wrote substantial entries on over two and a half thousand people -- from Adam and Eve to Spinoza -- and near two hundred entries on non-person topics. But he delivered his most influential skeptical arguments in the extended footnotes to his entries. Of particular importance were his entries on Eve, David, Pyrrho, the Manicheans, the Paulicans, Zeno, Pomponazzi, Xenophanes, Spinoza, Nicole, and Pellison.

Bayle's Pyrrhonism involved two claims: (1) by the principles of philosophy one is led to doubt everything, and (2) the futile search within philosophy for certitude by the "natural light" leads one to conclude that it is necessary to turn to the supernatural light. In addition to epistemological topics (such as external objects) being cast into doubt, Bayle's Pyrrhonism attacked the concepts of space, morality and rational theology as well.

Critics of Early Modern Skepticism. A number of philosophers arose in strong opposition skepticism, such as Father Mersenne (remembered for his letters to Descartes), Wilhelm Langius and Jean-Pierre de Crousaz. Mersenne responded by giving a point by point refutation of Sextus' arguments. Crousaz argued that although the skeptic can find evidential problems in support of a given proposition P, there are, nevertheless, rules which guard against errors (although these rules do not guarantee truth).

More commonly, philosophers responded to the skeptical crisis less vehemently, such as Pascal, Malebranche, the Chevalier Ramsey (whom Hume visited when writing his *Treatise*), Abbe Foucher, Andrew Baxter and Archbishop Fenelon. The issue for these was not one of refuting the skeptic's arguments, but, given the skeptics claim, how could one avoid the *prescriptive consequence* of either doubting a given contention or suspending belief in that contention? Ramsey, for example, agreed with the Pyrrhonist's arguments maintaining that there is no demonstrative knowledge of any proposition, but such knowledge is not necessary if we have persuasive arguments supporting that proposition. Baxter argued similarly that even though the Pyrrhonist's arguments are sound, they cannot be consistently *believed*, consequently the skeptical arguments

fail.

Hume's Skepticism. Hume's skepticism emerges from virtually every topic on which he wrote, such as causality, personal identity, external objects, determinism, morality, and religion. However, his quintessential skeptical arguments appear in the final Part of *Treatise* Book I. There Hume not only denies the possibility of securing knowledge on issues held dear by traditional philosophers, but he argues further that reason is riveted with internal contractions. Section 12 of the *Enquiry* reiterates this theme, drawing on Zeno's paradoxes. Hume was acquainted with the skeptical writings of Sextus Empiricus and Bayle, and undoubtedly were of influence. He was also familiar with the above modern critiques of skepticism, which directed his unique spin on skepticism. Unlike Ramsey and Baxter, Hume argued that the philosophical truth of skepticism is an entirely different issue than the psychological ability to doubt or suspend judgment about a given proposition. Thus, the psychological issue can never constitute a refutation of the philosophical question. This makes Hume a uniquely consistent Pyrrhonist since one's psychological stance towards a proposition has no bearing on the philosophical consistency with which it is undermined.

In spite of Hume's skeptical arguments, there is a positive or constructive side to his writings, but where the one starts and the other stops is a matter of dispute. One problem is that Book I is mainly a collection of discussions on various epistemological topics such as space, time, causality, external objects and personal identity. Sometimes the topics are related, at other times they are not. This only makes it more difficult to see a pattern to his skepticism. After several unsuccessful attempts at finding a consistent interpretation, Passmore concluded pessimistically that, "to be a Humean, precisely, is to take no system as final, nothing as ultimate except the spirit of enquiry" (*Hume's Intentions*, 1952, p. 159). Contrary to Passmore, though, most commentators attempt some systematic account. Livingston argues that Hume's skeptical arguments are only a tool to procure a psychological compelling set of beliefs. For Livingston, Hume presents a number of epistemological accounts of external objects, but then skeptically rejects them all: "the Pyrrhonian arguments are a necessary stage in the natural history of philosophical reflection from vulgar thought through false philosophy to philosophy that is true." What emerges from Livingston's interpretation is a "true philosophy" which presupposes the original authority of common life (*Hume's Philosophy of Common Life*, 1985, pp. 3, 27-28, 247). However, the question still remains whether Hume's "philosophy of common life" itself constitutes a skeptical set of propositions. Norton believes that it does. For Norton, Hume adopted a skeptical method of arguing, similar to the Academic skepticism of Carneades and Cicero as a response to a speculative crisis in his day. This skeptical methodology also made for a skeptical set of propositions (including cause and effect, external objects and miracles) insofar as these propositions must be viewed with a certain "modesty and diffidence" (*David Hume*, 1982, pp. 220, 294). Although one senses from Norton's account that Hume is not just another Bayle or modern Academic skeptic, he only briefly notes a few features of Hume's skeptical methodology which distinguish him from his skeptical mentors (Norton 1982, 290-295).

J. Fieser

Social Contract

Social contract theory is the view that morality is founded solely on uniform social agreements that serve the best interests of those who make the agreement. Historically social contract theory is an outgrowth of natural law theory, specifically the theories of Grotius and Pufendorf. However, we find hints at social contract reasoning in earlier works, most notably in Book 2 of Plato's dialog *The Republic*. Two distinct portions of that Book contain social contractarian themes, the first of which is offered by a skeptical character in the dialog named Glaucon. According to Glaucon, we all recognize that it is good for us individually to be unjust, although it is bad for us individually to suffer. We also recognize that if we do act unjustly, we will suffer injuries from other people. To avoid suffering injury, then, make contracts with each other by which we give up injustice and practice justice. To demonstrate his point about our preference to be unjust, Glaucon presents a myth about a shepherd named Gyges who finds a ring that makes him invisible when he wears it. Understanding the special advantage gained by having such a ring, Gyges uses its powers to seduce the Queen and Kill the King. Glaucon then argues that if there were two such rings, worn by a just person and an unjust person respectively, they would both commit the same kind of unjust deeds. Plato himself rejects this skeptical view about justice; however, the hero of the dialog - the character Socrates - presents a different contractarian account of the origin of justice in society. According to Socrates, societies are formed for the purpose of fulfilling our human needs. We have many needs and thus many kinds people and activities are required to fulfill all those needs. We then form partnerships by which we exchange goods and services. The mutual fulfilling of the various tasks is the basis of justice in society.

HOBBES. The definitive statement of social contract theory is found in Chapters 13 through 15 of Hobbes's Leviathan. Briefly, Hobbes argues that the original state of nature is a condition of constant war, which rational and self-motivated people would want to end. These people, then, will establish fundamental moral laws to preserve peace. The foundation of Hobbes's theory is the view that humans are psychologically motivated by only selfish interests. Hobbes argued that, for purely selfish reasons, the agent is better off living in a world with moral rules than one without moral rules. Without moral rules, we are subject to the whims of other people's selfish interests. Our property, our families, and even our lives are at continual risk. Selfishness alone will therefore motivate each agent to adopt a basic set of rules which will allow for a civilized community. Not surprisingly, these rules would include prohibitions against lying, stealing and killing. However, these rules will ensure safety for each agent only if the rules are enforced. As selfish creatures, each of us would plunder our neighbors' property once their guards were down. Each agent would then be at risk from his neighbor. Therefore, for selfish reasons alone, we devise a means of enforcing these rules: we create a policing agency which punishes us if we violate these rules. Like rule-utilitarianism, Hobbes's social contract theory is a three-tiered moral system. Particular acts, such as stealing my neighbor's lawn furniture, are w rong since they violate the rule against stealing. The rule against stealing, in turn, is morally binding since it is in my interests to live in a

world which enforces this rule.

There are several traditional criticisms of Hobbes's theory. First critics questioned whether humans are as self-interested as Hobbes contends: many people have transcendent interests which focus on social, religious, or political communities. Second , it is not clear that people who are fundamentally equal in the state of nature would be rationally motivated to attack each other, given only a 50-50 chance of survival. Third, the moral rules arrived at make demands of an agent which go beyond what is necessary for an agent's self-preservation -- which is that agent's sole motive for making the contract. Fourth, the moral rules arrived at are only rules of prudence for people motivated by egoistic concerns. Thus, it is difficult to call this a "moral" theory. Finally, it is not clear why we should consistently follow a moral rule (such as a prohibition against stealing) if it can occasionally violate that rule without being caught. Further, since I am motivated only by self-interest, I would have strong reasons to occasionally violate rules when that served my interests. Social contract theory, then, will obligate me to follow moral rules only to the point where it is necessary to keep society together. And this makes it a fairly weak normative theory.

OTHER SOCIAL CONTRACT THEORIES. After Hobbes, social contract theory developed in different directions. John Locke argued that the state of nature is a pre-political, yet moral society where humans are bound by divinely commanded natural law. A social contract is made between citizens who institute a government to prevent people from occasionally violating natural law and showing partiality. Jean-Jacques Rousseau argued that the state of nature is not a state of war, but a state of individual freedom where creativity flourishes. Since a fully mature person is a social person, a social contract is established to regulate social interaction. This contract between citizens establishes an absolute democracy which is ruled by the general will, or what is best for all people. Interest in social contract theory declined in the 19th century with the rise of utilitarianism, the theory that actions are right when they produce more benefit than disbenefit for society. Contemporary versions of social contract theory attempt to show that our basic rights and liberties are founded on mutually beneficial agreements which are made between members of society. John Rawls argues in A Theory of Justice (1971) that in an original position, a group of rational and impartial people will establish a mutually beneficial principle of justice as the foundation for regulating all rights, duties, power, and wealth.

Vladimir Solovyov (1853-1900)

LIFE. Solovyov was born in Moscow in 1853. His father, Sergej Mikhailovich, a professor at Moscow University, is universally recognized as one of Russia's greatest historians. After attending secondary school in Moscow, Vladimir enrolled at the university and began his studies there in the natural sciences in 1869, his particular interest at this time being biology. Already at the age of 13 he had renounced his Orthodox faith to his friends, accepting the banner of materialism perhaps best illustrated by the fictional character of Bazarov in Turgenev's novel *Fathers and Sons* and the actual historical figure of Pisarev. During the first two or three years of study at the university Solovyov grew disenchanted with his ardent positivism and did poorly in his examinations. An excellent student prior to this time, there is no reason for us to doubt his intellectual gifts. Nevertheless, although he himself as well as his interpreters have attributed his poor performance to growing disinterest in his course of study, this reasoning may sound to us at least somewhat disingenuous. In any case, Solovyov subsequently enrolled as an auditor in the Historical-Philosophical Faculty, then passing the examination for a degree in June 1873.

At some point during 1872 Solovyov reconverted, so to speak, to Orthodoxy. During the academic year 1873-74 he attended lectures at the Moscow Ecclesiastic Academy--an unusual step for a lay person. At this time Solovyov also began the writing of his magister's dissertation, several chapters of which were published in a Russian theological journal already before his formal defense of it in early December 1874. The death of his Moscow University philosophy teacher Pamfil Jurkevich created a vacancy that Solovyov surely harbored hopes of eventually filling. Nevertheless, despite being passed over, owing, at least in part, to his young age and lack of credentials, he was named a docent (lecturer) in philosophy. In spite of taking up his teaching duties with enthusiasm, within a few months Solovyov applied for a scholarship to do research abroad, primarily in London's British Museum.

His stay in the English capital was met with mixed emotions, but it could not have been entirely unpleasant, for in mid-September 1875 he was still informing his mother of plans to return to Russia only the following summer. For whatever reason, though, Solovyov abruptly changed his mind, writing again to his mother a mere month later that his work required him to go to Egypt via Italy and Greece. Some have attributed his change of plans to a mystical experience while sitting in the reading room of the Museum!

Upon his return to Russia the following year, Solovyov taught philosophy at Moscow University. He began work on a text that we know as the *Philosophical Principles of Integral Knowledge*, but which he never finished. In early 1877 Solovyov relinquished his university position due to his aversion towards academic politics, took up residence in St. Petersburg and accepted employment in the Ministry of Public Education. While preparing his doctoral dissertation, Solovyov gave a series of highly successful popular lectures at St. Petersburg University that was later published as *Lectures on Divine Humanity*, and in 1880 he defended a doctoral dissertation at St. Petersburg

University. Any lingering hope Solovyov may have entertained of obtaining a professorship in Russia were dashed when in early 1881 during a public lecture he appealed to the Tsar to pardon the regicides of the latter's father Alexander II.

For the remainder of the 1880s, despite his prolificacy, Solovyov concerned himself with themes of little interest to contemporary Western philosophy. He returned, however, to traditional philosophical issues in the 1890s, working in particular on ethics and epistemology. His studies on the latter, however, were left quite incomplete owing to his premature death in 1900 at the age of 47. At the end Solovyov, together with his younger brother, was also preparing a new Russian translation of Plato's works.

INTERPRETATIONS OF SOLOVYOV'S PHILOSOPHICAL WRITINGS. Despite the vast amount of secondary literature, particularly, of course, in Russian, little, especially that in English, is of interest to the professionally-trained philosopher. Nevertheless, even while memory of him was still fresh, many of his friends differed sharply on key issues involved in interpreting Solovyov's writings and legacy. Among the topics debated over the years has been the number of phases or periods through which his thought passed. Opinions have ranged from four to just one, depending largely on the different criteria selected for demarcating one period from another. Those who hold that Solovyov's thought underwent no "fundamental change" [Shein] do not deny that there were modifications but simply maintain that the fundamental thrust of his philosophy remained unaltered over the course of time. Others see different emphases in Solovyov's work from decade to decade. Yet in one of the most philosophically-informed interpretations, Solovyov moved from a philosophy of "integral knowledge" to a later phenomenological phase that anticipated the "essential methodology" of the German movement [Dahm].

Historically, another central concern among interpreters has been the extent of Solovyov's indebtedness to various other figures. Whereas several have stressed the influence of, if not an outright borrowing from, the late Schelling [Mueller, Shein], at least one prominent scholar has sought to accentuate Solovyov's independence and creativity [Losev]. Still others have argued for Solovyov's indebtedness to Hegel [Navickas], Kant [Vvedenskij], Boehme [David], the Russian Slavophiles and the philosophically-minded theologians Jurkevich and Kudryavtsev.

In Russia itself the thesis that Solovyov had no epistemology [Radlov] evoked a spirited rebuttal [Ern] that has continued in North America [Shein, Navickas]. None of these scholars, however, has demonstrated the presence of more than a rudimentary epistemology, at least as that term is currently employed in contemporary philosophy. Additionally, the vast majority of secondary studies have dealt with Solovyov's mysticism and views on religion, nationalism, social issues, and the role of Russia in world history. Consequently, it is not surprising that those not directly acquainted with his explicit philosophical writings and their Russian context view Solovyov as having nothing of interest to say in philosophy proper. We should also mention one of the historically most influential views, one that initially at least appears quite plausible. Berdyaev, seeing Solovyov as a paradoxical figure, distinguished a day- from a night-Solovyov. The "day-Solovyov" was a philosophical rationalist, in the broad sense, an idealist, who sought to convey his highly metaphysical religious and ontological conceptions through philosophical discourse utilizing terms current at the time; the "night- Solovyov" was a mystic who conveyed his personal revelations largely through poetry.

***THE CRISIS OF WESTERN PHILOSOPHY*. This, Solovyov's first major work, displays youthful enthusiasm, vision, optimism and a large measure of audacity. Unfortunately, it is also at times**

repetitious and replete with sweeping generalizations, unsubstantiated conclusions, and non sequiturs. The bulk of the work is an excursion in the history of modern philosophy in an attempt to substantiate and amplify Solovyov's justly famous claims, made already in the opening lines, that: (i) philosophy, qua a body of abstract, purely theoretical knowledge, has finished its development; (ii) philosophy in this sense is no longer nor will it ever again be maintained by anyone; (iii) philosophy has bequeathed to its successor certain accomplishments or results that this successor will utilize to resolve the problems that philosophy has unsuccessfully attempted to resolve.

Solovyov tells us that his ambitious program differs from positivism in that, unlike the latter, he understands the superseded artifact called "philosophy" to include not merely its "speculative" but also its "empirical" direction. Whether these two directions constitute the entirety of modern philosophy, i.e., whether there has been any historical manifestation of another sense of philosophy, one that is not purely theoretical, during the modern era, is unclear. Also left unclear is what precisely Solovyov means by "positivism." He mentions as representatives of that doctrine Mill, Spencer and Comte, whose views were by no means identical, and mentions as the fundamental tenet of positivism that "independent reality cannot be given in external experience." This I take to mean that experience yields knowledge merely of things as they appear, not as they are "in themselves." Solovyov has, it would seem, confused positivism with phenomenalism.

Solovyov's reading of the development of modern philosophy proceeds along the lines of Hegel's own interpretation and, similar to the latter, sees Hegel's "panlogism" as the *necessary* result of Western philosophy. The "necessity" here is clearly conceptual, although Solovyov implicitly accepts without further ado that this necessity has, as a matter of fact, been historically manifested in the form of individual philosophies. Moreover, in line with Hegel's apparent self-interpretation Solovyov agrees that the former's system permits no further development. For the latter, at least, this is because, having rejected the law of (non)contradiction, Hegel's philosophy sees internal contradiction, which otherwise would lead to further development, as a "logical necessity," i.e., as something the philosophy itself requires and is accommodated within the system itself.

Similarly, Solovyov's analysis of the movement from Hegelianism to mid-19th century German materialism is largely indebted to the left-Hegelians. Solovyov, however, merely claims that one can exit Hegelianism by acknowledging its fundamental one-sidedness, a proposition the truth-value of which would be factual. Yet in the next breath, as it were, he holds that the emergence of empiricism, qua materialism, was necessary. Out of the phenomenalism of empiricism arises Schopenhauer's philosophy and thence Eduard von Hartmann's.

All representatives of Western philosophy, including to some extent Schopenhauer and von Hartmann, see rational knowledge as the decomposition of intuition into its sensuous and logical elements. Such knowledge, however, in breaking up the concrete into abstractions without re-synthesizing them, *additionally* is unable to recognize these abstractions as such but must hypostatize them. Nevertheless, even were we to grant Solovyov's audacious thesis that *all* Western philosophers have done this abstraction and hypostatizing, it by no means follows that rational thought necessarily has had to follow this procedure.

According to Solovyov, von Hartmann, in particular, is aware of the one-sidedness of both rationalism and empiricism, which respectively single out the logical and the sense element in cognition to the exclusion of the other. Nevertheless, he too hypostatizes will and idea instead of realizing that the only way to avoid any and all bifurcations is through a recognition of what

Solovyov terms "the fundamental metaphysical principle," namely that the all-encompassing spirit is the truly existent. This hastily enunciated conclusion receives here no further argument. Nor does Solovyov dwell on establishing his ultimate claim that the results of Western philosophical development, issuing in the discovery of the all-encompassing spirit, agree with the religious beliefs of the Eastern Church fathers.

***PHILOSOPHICAL PRINCIPLES OF INTEGRAL KNOWLEDGE* This work originally appeared during 1877 as a series of articles in an official journal published by the Ministry of Education (*Zhurnal Ministerstva narodnogo prosveshchenija*). Of Solovyov's major writings it is probably the most difficult for the philosopher today to understand owing, to a large degree, to its forced trichotomization of philosophical issues and options and its extensive use of terms drawn from mystical sources even when employed in a quite different sense.**

There are three fundamental aspects, or "subjective foundations," of human life--in Solovyov's terminology, "forms of being": feeling, thinking and willing, each of which has both a personal and a social side, and each has its objective intentional object. These are, respectively, objective beauty, objective truth and the objective good. Three fundamental forms of the social union arise from human striving for the good: economic society, political society or government, and spiritual society. Likewise in the pursuit of truth there arises positive science, abstract philosophy, and theology. Lastly, in the sphere of feeling we have the technical arts, such as architecture, the fine arts and a form of mysticism, which Solovyov emphasizes is an immediate spiritual connection with the transcendent world and as such is not to be confused with the term "mysticism" as used to indicate a reflection on that connection.

Human cultural evolution has literally passed through these forms and done so according to what Solovyov calls "an incontestable law of development." Economic socialism, positivism and utilitarian realism represent for him the highest point yet of Western civilization and, in line with his earlier work, the final stage of its development. But Western civilization with its social, economic, philosophic and scientific atomization represents only a second, transitional phase in human development. The next, final stage, characterized by freedom from all one- sidedness and elevation over special interests is presently a "tribal character" of the Slavic peoples and, in particular, of the Russian nation.

Although undoubtedly of some historical interest as an expression of and contribution to ideas circulating in Russia as to the country's role in world affairs, Solovyov expounded all the above without argument and as such is of little interest to contemporary philosophy. Of somewhat greater value is his critique of traditional philosophical directions.

Developing its essential principle to the end, empiricism holds that I know only what the senses tell me. Consequently, I know even of myself only through conscious impressions, which, in turn, means that I am nothing but states of consciousness. Yet my consciousness presupposes me. Thus, we have found that empiricism leads, by *reductio ad absurdum*, to its self-refutation. The means to avoid such a conclusion, however, lies in recognizing the absolute being of the cognizing subject, which, in short, is idealism.

Likewise, the consistent development of the idealist principle leads to a denial of the epistemic subject and pure thought. The dissolution of these two directions means the collapse of all abstract philosophy. We are left with two choices: either complete skepticism or the view that what truly exists has an independent reality quite apart from our material world, a view Solovyov terms "mysticism." With mysticism we have, in Solovyov's view, exhausted all logical options. That is,

having seen that holding the truly existing to be either the cognized object or the cognizing subject leads to absurdity, the sole remaining logical possibility is that offered by mysticism, which, thus, completes the "circle of possible philosophical views." Although empiricism and rationalism (= idealism) rest on false principles, their respective objective contents, external experience, qua the foundation of natural science, and logical thought, qua the foundation of pure philosophy, are to be synthesized or encompassed along with mystical knowledge in "integral knowledge," what Solovyov terms "theosophy."

For whatever reason, *Philosophical Principles of Integral Knowledge* remained incomplete. Despite its expression of his own views, which undoubtedly at this stage were greatly indebted to the Slavophiles, Solovyov altered his *original* plan to submit this work as a doctoral dissertation. Instead, in April 1880 he defended at St. Petersburg University a large work that he had begun at approximately the same time as the *Philosophical Principles* and which, like the latter, appeared in serialized form starting in 1877 and as a separate book in 1880.

***CRITIQUE OF ABSTRACT PRINCIPLES* Originally planned to comprise three parts, ethics, epistemology and aesthetics, (which alone already reveals a debt to Kant) the completed work never turned to the last of these, on which, however, Solovyov labored extensively. Nevertheless, owing largely to its traditional philosophical style and its extended treatment of major historical figures, the *Critique* remains the most accessible of Solovyov's major early writings today.**

(1) Subjective Ethics. Over the course of human development a number of principles have been advanced in pursuit of various goals deemed to be that for which human actions should strive, for example, pleasure, happiness, fulfillment of duties, adherence to God's will, etc. Certainly seeking happiness, pleasure, or the fulfillment of duty is not unequivocally wrong. Yet the pursuit of any one of these alone without the others cannot provide a basis for a totally satisfactory ethical system. A higher synthesis or, if you will, a more encompassing unity is needed, one that will reveal how and when any of these particular pursuits is ethically warranted. Such a unity will show the truth, and thereby the error, of singling out any particular moment of the unity as sufficient alone. Doing so, that is, showing the proper place of each principle, showing them as necessary yet inadequate stages on the way to a complete synthetic system is what Solovyov means by "the critical method."

In the end all moral theories that rest on an empirical basis, something factual in human nature, fail because they cannot provide and account for obligation. The essential feature of moral law, as Solovyov understands the concept, is its absolute necessity for all rational beings. The Kantian influence here is unmistakable and indubitable. Nevertheless, Solovyov parts company with Kant in expressing that a natural inclination in support of an obligatory action *enhances* the moral value of an action. Since duty is the general *form* of the moral principle, whereas an inclination serves as the psychological motive for a moral action, i.e., as the material aspect of morality, the two cannot contradict one another.

The Kantian categorical imperative, which Solovyov, in general, endorses, presupposes freedom. Of course, we all feel that our actions are free, but what kind of freedom is this? Here Solovyov approaches phenomenology in stating that the job of philosophy is to analyze this feeling with an eye to determining what it is we are aware of. Undoubtedly, for the most part we can do as we please, but such freedom is freedom of action. The question, however, is whether I can actually *want* something other than I do, i.e., whether *the will* is free.

Again like Kant, Solovyov believes all our actions, even the will itself, is, at least viewed empirically, subject to the law of causality. From the moral perspective, however, there is a

"causality of freedom," a freedom to initiate a causal sequence on the part of practical reason. In other words, empirically the will is determined, whereas transcendentally it is free. Solovyov, though, goes on to pose, at least rhetorically, the question whether this transcendental freedom is genuine or could it be that the will is subject to transcendental conditions. In doing so, he reveals that his conception of "transcendental" differs from that of Kant. Nevertheless, waving aside all difficulties associated with a resolution of the metaphysical issue of freedom of the will, Solovyov tells us, ethics has no need of such investigations; reason and empirical inquiry are sufficient. The criteria of moral activity lie in its universality and necessity, i.e., that the principle of one's action can be made a universal law.

(2) Objective Ethics. In order that the good determine my will I must be subjectively convinced that the consequent action can be realized. This moral action presupposes a certain knowledge of and is conditioned by society. Subjective ethics instructs us that we should treat others not as means but as ends. Likewise, they should treat me as an end. Solovyov terms a community of beings freely striving to realize each other's good as if it were his or her own good "free communality." Although some undoubtedly see material wealth as a goal, it cannot serve as a *moral* goal. Rather, the goal of free communality is the just distribution of wealth, which, in turn, requires an organization to administer fair and equal treatment of and to all, in other words, a political arrangement or government. To make the other person's good my good, I must recognize such concern as obligatory. That is, I must recognize the other as having rights, which my *material* interests cannot infringe.

If all individuals acted for the benefit of all, there would be no need for a coordination of interests, for interests would not be in conflict. There is, however, no universal consensus on benefits and often enough individually perceived benefits conflict. In this need for adjudication lies a source of government and law. Laws express the negative side of morality, i.e., they do not say what *should* be done, but what is *not permitted*. Thus, the legal order is unable to provide positive directives, precisely because what humans specifically should do and concretely *aspire* to attain remains conditional and contingent. The absolute, unconditional form of morality demands an absolute, unconditional content, viz. an absolute goal.

As a finite being, the human individual cannot attain the absolute except through positive interaction with all others. Whereas in the legal order each individual is limited by the other, in the aspiration or striving for the absolute the other aids or completes the self. Such a union of beings is grounded psychologically in love. As a contingent being the human individual cannot fully realize an absolute object or goal. Only in the process of individuals working in concert, forming a "total-unity," does love become a non-contingent state. Only in an inner unity with all does man realize what Solovyov calls "the divine principle."

Solovyov himself views his position as diametrically opposed to that of Kant, who from absolute moral obligation was led to postulating the existence of God, immortality and human freedom. For Solovyov, the realization of morality presupposes an affirmative metaphysics. Once we progress from Kant's purely subjective ethics to an objective understanding of ethics, we see the need for a conviction in the theoretical validity of Kant's three postulates, their metaphysical truth independent of their practical desirability.

Again differing from Kant, and Fichte too, Solovyov at this point in his life rejects the priority of ethics over metaphysics. The genuine force of the moral principle rests on the existence of the absolute order. And the necessary conviction in this order can be had only if we know it to be true,

which demands an epistemological inquiry.

(3) Epistemology/Metaphysics. "To know what we should do we must know what is," Solovyov tells us. To say what is, however, is informative only in contrast to saying, at least implicitly, what is not -- this we already know from the opening pages of Hegel's *Logic*. One answer is that the true is that which objectively exists independent of any knowing subject. Here Solovyov leads us down a path strikingly similar, at least in outline, to that taken in the initial chapters of Hegel's *Phenomenology*. If the objectively real is the true, then *sense certainty* is our guarantee of having obtained it. But this certainty cannot be that of an individual knowing subject alone, for truth is objective and thus the same for everyone. Truth must not be in the facts but the things that make up the facts. Moreover, truth cannot be the individual things in isolation, for truths would then be isomorphic with the number of things. Such a conception of truth is vacuous; no, truth is one. With this Solovyov believes he has passed to naturalism.

Of course, our immediate sense experience lacks universality and does not in all its facets correspond to objective reality. Clearly, many qualities of objects, for example, color and taste, are subjective. Thus, reality must be what is general or present in *all* sense experience. To the general foundation of sensation corresponds the general foundation of things, viz. that conveyed through the sense of touch, i.e., the experience of resistance. The general foundation of objective being is its impenetrability.

Holding true being to be single and impenetrable, however, remains untenable. Through a series of dialectical maneuvers, reminiscent of Hegel, Solovyov arrives at the position that true being contains multiplicity. That is, whereas it is singular owing to absolute impenetrability, it consists of separate particles, each of which is impenetrable. Having in this way passed to atomism, Solovyov provides a depiction largely indebted to Kant in the latter's *Metaphysical Foundations of Natural Science*. Of course, the former recognizes that we have reached atomism, not through some experimental technique but through philosophical, logical reasoning. But every scientific explanation of the ultimate constituents of reality transgresses the bounds of experience. We return to the viewpoint that reality belongs to appearances alone, i.e., what is given in experience. Now, however, our realism has been dialectically transformed into a phenomenal or critical realism.

According to phenomenal realism, absolute reality is ultimately inaccessible to cognition. Nevertheless, that which cognitively is accessible constitutes a relative objectivity and is our sole standard for determining truth and thus knowledge. In this sensualism -- for that is what it is -- we refer particular sensations to definite objects. These objects are taken as objectively real despite the manifest subjectivity of sensation in general. Thus, objectification, as the imparting of the sense of objectivity onto the content of sensations, must be an independent activity of the cognizing subject.

Objectification, alone, cannot account for the definite object before me to which all my sensations of that object refer as parts or aspects. In addition to objectification there must be a unification or synthesizing of sensations, and this process or act is again distinct from sensing and certainly is not part of the sensation itself. Again evoking an image of Kant in the reader, Solovyov calls the independent cognitive act whereby sense data are formed into definite objective representations the *imagination*.

The two factors we have discerned, one contributed by the epistemic subject and the other by sensation, are absolutely independent of each other. Cognition requires both, but what connects them remains unanswered. According to Solovyov, any connection implies dependence, but the a

priori element certainly cannot be dependent on the empirical. For, following Hume, from the factual we cannot deduce the universality and the necessity of a law. The other alternative is to have the content of true cognition dependent on the forms of reason; such is the approach of Hegel's absolute rationalism. However, if all the determinations of being are created by cognition, then at the beginning we have only the pure form of cognition, pure thought, a concept of being in general. Solovyov finds such a starting point to be vacuous. For although Hegel correctly realizes the general form of truth to be universality, it is a negative conception from which nothing can be derived. The positive conception is a whole that contains everything in itself, not, as in Hegel, one that everything contains in itself.

For Solovyov, truth, in short, is the whole, and, consequently, each particular fact in isolation from the whole is false. Again Solovyov's position on rationality bears an uncanny resemblance to that of Hegel, although in the former's eyes this resemblance is superficial. Reason is the whole, and so the rationality of a particular fact lies in its interrelation with the whole. A fact divorced from the whole is irrational.

True knowledge, thus, implies the whole, the truly existent, the absolute. Following Solovyov's "dialectical" thinking, the absolute, qua absolute, presupposes a non-absolute; the whole or one presupposes the many. And, again conjuring up visions of Hegel, if the absolute *is* the one, the non-absolute is *becoming* the one. The latter can become the one only if it has the divine element potentially. In nature, the one exists only potentially, whereas in humans it is actual, though only ideally, i.e., in consciousness.

The object of knowledge has three forms: 1) as it appears to us empirically, 2) as conceptually ideal, and 3) as existing absolutely independent of our cognition of it. Our concepts and sensations would be viewed merely as subjective states were it not for the third form. The basis for this form is a third sort of cognition, without which objective truth would elude us. A study of the history of philosophy correctly shows that neither the senses nor the intellect, whether separately or in combination, can satisfactorily account for the third form. Sensations are relative, and concepts conditional. Indeed, the referral of our thoughts and sensations to an object in knowledge, thus, presupposes this third sort of cognition. Such cognition, viz., faith or mystical knowledge, would itself be impossible if the subject and the object of knowledge were completely divorced. In this interaction we perceive the object's essence or "idea," its constancy. The imagination (here, let us recall Kant), at a non-conscious level, organizes the manifold given by sense experience into an object via a referral of this manifold to the "idea" of the object.

Solovyov believes he has demonstrated that *all* knowledge arises through the confluence of empirical, rational and "mystical" elements. Only philosophical analysis can discover the role of the mystical. Just as an isolation of the first two elements has historically led to empiricism and rationalism respectively, so the mystical element has been accentuated by traditional theology. And just as the former directions have given rise to dogmatic manifestations, so too has theology found its dogmatic exponents. The task before us lies in freeing the three directions of their exclusiveness, intentionally integrating and organizing true knowledge into a complete system, which Solovyov called "free theosophy."

***THE JUSTIFICATION OF THE GOOD*. After the completion of the works mentioned above, Solovyov largely withdrew from philosophy, both as a profession and its concerns. During the 1880s he devoted himself increasingly to theological and topical social issues of little, if any, concern to the contemporary philosopher. However, in 1894 Solovyov took to preparing a second**

edition of the *Critique of Abstract Principles*. Owing, though, to an evolution, and thereby significant changes, in his viewpoint, he soon abandoned this venture and embarked on an entirely new statement of his philosophical views. Just as in his earlier treatise, Solovyov again intended to treat ethical issues before turning to an epistemological inquiry.

***The Justification of the Good* appeared in book form in 1897, many, though not all chapters of which had previously been published in several well-known philosophical and literary journals over the course of the previous three years. Largely in response to criticisms of the book or its serialized chapters, Solovyov managed to complete a second edition, which was published in 1899 and accompanied by a new preface.**

Most notably, Solovyov now holds that ethics is an independent discipline. In this he finds himself in solidarity with Kant, who made this "great discovery," as Solovyov put it. Knowledge of good and evil is accessible to all individuals possessing reason and a conscience and needs neither divine revelation nor epistemological deduction. Although philosophical analysis surely is unable to instill a certainty that I, the analyst, alone exist, solipsism even if true would eliminate only objective ethics. There is another, a subjective side to ethics that concerns duties to oneself. Likewise, morality is independent of the metaphysical question concerning freedom of the will. From the independence of ethics Solovyov draws the conclusion that life has meaning and, coupled with this, we can legitimately speak of a moral order.

The natural bases of morality, from which ethics as an independent discipline can be deduced and which form the basis of moral consciousness, are shame, pity and reverence. Shame reveals to man his higher human dignity. It sets the human apart from the animal world. Pity forms the basis of all of man's social relations to others. Reverence establishes the moral basis of man's relation to that which is higher to himself and, as such, is the root of religion.

Each of the three bases, Solovyov tells us, may be considered from three sides or points of view. Shame as a virtue reveals itself as modesty, pity as compassion and reverence as piety. All other proposed virtues are essentially expressions of one of these three. The other two points of view, as a principle of action and as a condition of an ensuing moral action, are interconnected with the first such that the first logically contains the others.

Interestingly, truthfulness is not itself a formal virtue. Solovyov opposes one sort of extreme ethical formalism, arguing that making a factually false statement is not always a lie in the moral sense. The nature of the will behind the action must be taken into account.

Likewise, despite his enormous respect for Kant's work in the field of ethics, Solovyov rejects viewing God and the immortality of the soul as postulates. God's existence, he tells us, is not a *deduction* from religious feeling or experience but its immediate content, i.e., that which is experienced. Furthermore, he adds that God and the soul are "direct creative forces of moral reality." How we are to interpret these claims in light of the supposed independence of ethics is contentious unless, of course, we find Solovyov guilty of simple-mindedness. Indeed one of his own friends [Trubeckoj] wrote: "It is not difficult to convince ourselves that these arguments about the independence of ethics are refuted on every later page in the *Justification of the Good*." However we look upon Solovyov's pronouncements, the Deity plays a significant role in his ethics. Solovyov provides a facile answer to the perennial question of how a morally perfect God can permit the existence of evil: Its elimination would mean the annihilation of human freedom thereby rendering free goodness (good without freedom is imperfect) impossible. Thus, God permits evil, because its removal would be a greater evil.

Often, all too often, Solovyov is prone to express himself in metaphysical, indeed theological, terms that do little to clarify his position. The realization of the Kingdom of God, he tells us, is the goal of life. What he means, however, is that the realization of a perfect moral order, in which the relations between individuals and the collective whole's relations to each individual are morally correct, is all that can be rationally desired. Each of us understands that the attainment of moral perfection is not a solipsistic enterprise, i.e., that the Kingdom of God can only be achieved if we each want it and collectively attain it. The individual can attain the moral ideal only in and through society. Christianity alone offers the idea of the perfect individual and the perfect society. Other ideas have been presented (Solovyov mentions Buddhism and Platonism), of course, and these have been historically necessary for the attainment of the universal human consciousness that Christianity promises.

Man's correct relations to God, his fellow humans and his own material nature, in accordance with the three foundations of morality, viz., piety, pity, or compassion, and shame, are collectively organized in three forms. The Church is collectively organized piety, whereas the state is collectively organized pity or compassion. To view the state in such terms already tells us a great deal concerning how Solovyov views the state's mission and, consequently, his general stand toward laissez-faire doctrines. Although owing to the connection between legality and morality one can speak of a Christian state, this is not to say that in pre-Christian times the state had no moral foundations. Just as the pagan can know the moral law "written in his heart," (an expression of St. Paul's that Solovyov was fond of invoking but also reminiscent of Kant's "the moral law within") so too the pagan state has two functions: 1) to preserve the foundation of social life necessary for continued human existence, and 2) to improve the condition of humanity.

At the end of *The Justification of the Good* Solovyov attempts in the most cursory fashion to make a transition to epistemology. He claims that the struggle between good and evil raises the question of the latter's origin, which in turn ultimately requires an epistemological inquiry. That ethics is an independent discipline does not mean that it is not connected to metaphysics and the theory of knowledge. One can study ethics in its entirety without first having answers to all other philosophical problems much as one can be an excellent swimmer without knowing the physics of buoyancy.

***THEORETICAL PHILOSOPHY*. During the last few years of his life Solovyov sought to recast his thoughts on epistemology. Surely he intended to publish in serial fashion the various chapters of a planned book on the topic, much as he did *The Justification of the Good*. Unfortunately at the time of his death in 1900 only three chapters were completed, and it is only on the basis of these that we can judge his new standpoint. Nevertheless, on the basis of these meager writings we can already see that Solovyov's new epistemological reflections exhibit a greater transformation of his thoughts on the subject than does his ethics. Whereas a suggested affinity between these ideas and later German phenomenology must be viewed with caution and, in light of his earlier thoughts, a measure of skepticism, there can be little doubt that to all appearances Solovyov spoke and thought in this late work in a philosophical idiom close to that with which we have become familiar in the 20th century.**

For Solovyov epistemology concerns itself with the validity of knowledge in itself, that is, not in terms of whether it is useful in practice or provides a basis for an ethical system that has for whatever reason been accepted. Perhaps not surprisingly then, particularly in light of his firm religious views, Solovyov adheres to a correspondence theory, saying that knowledge is the agreement of a thought of an object with the actual object. The open questions are how such an

agreement is possible and how do we know that we know.

The Cartesian "I think, therefore I am" leads us virtually nowhere. Admittedly the claim contains indubitable knowledge, but it is merely that of a subjective reality. I might just as well be thinking of an illusory book as of an actually existing one. How do we get beyond the "I think"; how do we distinguish a dream from reality? The criteria are not present in the immediacy of the consciously intended object. To claim as did some Russian philosophers in his own day that the reality of the external world is an immediately given fact appears to Solovyov an arbitrary opinion hardly worthy of philosophy. Nor is it possible to deduce from the Cartesian inference that the I is a thinking substance. Here is the root of Descartes' error. The self discovered in self-consciousness has the same status as the object of consciousness, i.e., both have phenomenal existence. If we cannot say what this object of my consciousness is like in itself, i.e., apart from my conscious acts, so too we cannot say what the subject of consciousness is apart from consciousness and for the same reason. Likewise, just as we cannot speak about the I in itself, so too we cannot answer to whom consciousness belongs.

In "The Reliability of Reason," the second article comprising the *Theoretical Philosophy*, Solovyov concerns himself with affirming the universality of logical thought. In doing so he stands in opposition to the popular reductionisms, e.g., psychologism, that sought to deny any extra-temporal significance to logic. Thought itself, Solovyov tells us, requires recollection, language and intentionality. Since any logical thought is, nevertheless, a thought and since thought can be analyzed in terms of psychic functions, one could conceivably charge Solovyov with lapsing back into a psychologism, in precisely the same way as some critics have charged Husserl with doing so. And much the same defenses of Husserl's position can also be used in reply to the objection against Solovyov's stance.

The third article, "The Form of Rationality and the Reason of Truth," published in 1898, concerns itself with the proper starting points of epistemology. The first such point is the indubitable veracity of the given in immediate consciousness. There can be no doubt that the pain I experience upon stubbing my toe is genuine. The second starting point of epistemology is the objective, universal validity of rational thought. Along with Hume and Kant, Solovyov does not dispute that factual experience can provide claims only to conditional generality. Rationality alone provides universality. This universality, however, is merely formal. To distinguish the rational form from the conditional content of thought is the first essential task of philosophy. Taking up this challenge is the philosophical self or subject. Solovyov concludes, again as he always does, with a triadic distinction between the empirical subject, the logical subject and the philosophical subject. And although he labels the first the "soul," the second the "mind" and the third the "spirit," the trichotomy is contrived and the labeling, at best, imaginative with no foundation other than in Solovyov's a priori architectonic.

CONCLUDING REMARKS. Solovyov's relatively early death, brought on to some degree by his erratic life-style, precluded the completion of his last philosophical work. He also intended to turn his attention eventually towards aesthetics, but whether he would ever have been able to complete such a project remains doubtful. Solovyov was never at any stage of his development able to complete a systematic treatise on the topic, although he did publish a number of writings on the subject.

However beneficial our reading of Solovyov's works may be, there can be little doubt that he was very much a 19th-century figure. We can hardly take seriously his incessant predilection for

triadic schemes, far in excess to anything similar in the German Idealists. His choice of terminology, drawn from an intellectual fashion of his day, also poses a formidable obstacle to the contemporary reader. Lastly, despite, for example, an often perspicacious study of his philosophical predecessors, written during his middle years, Solovyov, in clinging obstinately to his rigid architectonic, failed to penetrate further than they. Indeed, he often fell far short of their achievements. His discussion of imagination, for example, as we saw, is much too superficial, adding nothing to that found in Kant. These shortcomings, though, should not divert us from recognizing his genuinely useful insights.

After his death, with interest surging in the mystical amid abundant decadent trends, so characteristic of decaying cultures, Solovyov's thought was seized upon by those far less interested in philosophical analysis than he was towards the end. Those who invoked his name so often in the years immediately subsequent to his death stressed the religious strivings of his middle years to the complete neglect of his final philosophical project, let alone its continuation and completion. In terms of Solovyov-studies today the philosophical project of discovering the "rational kernel within the mystical shell" [Marx], of separating the "living from the dead" [Croce], remains not simply unfulfilled but barely begun.

Sophists

The growing demand for education in 5th century BCE. Greece called into existence a class of teachers known as sophists. They were a professional class rather than a school, and as such they were scattered over Greece and exhibited professional rivalries. The educational demand was partly for genuine knowledge, but mostly reflected a desire for spurious learning that would lead to political success. They wandered about Greece from place to place, gave lectures, took pupils, and entered into disputations. For these services they exacted large fees, and were, in fact, the first in Greece to take fees for teaching wisdom. Though not disgraceful in itself, the wise men of Greece had never accepted payment for their teaching. The sophists were not, technically speaking, philosophers, but, instead taught any subject for which there was a popular demand. Topics included rhetoric, politics, grammar, etymology, history, physics, and mathematics. Early on they were seen as teachers of virtue in the sense that they taught people to perform their function in the state. Protagoras of Abdera, who appeared about 445 BCE. is named as the first Sophist; after him the most important is Gorgias of Leontini, Prodicus of Ceos and Hippias of Elis. Wherever they appeared, especially in Athens, they were received with enthusiasm and many flocked to hear them. Even such people as Pericles, Euripides, and Socrates sought their company.

The most popular career of a Greek of ability at the time was politics; hence the sophists largely concentrated on teaching rhetoric. The aims of the young politicians whom they trained were to persuade the multitude of whatever they wished them to believed. The search for truth was not top priority. Consequently the sophists undertook to provide a stock of arguments on any subject, or to prove any position. They boasted of their ability to make the worse appear the better reason, to prove that black is white. Some, like Gorgias, asserted that it was not necessary to have any knowledge of a subject to give satisfactory replies as regards it. Thus, Gorgias ostentatiously answered any question on any subject instantly and without consideration. To attain these ends mere quibbling, and the scoring of verbal points were employed. In this way, the sophists tried to entangle, entrap, and confuse their opponents, and even, if this were not possible, to beat them down by mere violence and noise. They sought also to dazzle by means of strange or flowery metaphors, by unusual figures of speech, by epigrams and paradoxes, and in general by being clever and smart, rather than earnest and truthful. Hence our word "sophistry": the use of fallacious arguments knowing them to be such. Early on Sophists were seen to be of merit as people of superior skill or wisdom, as we find in Pindar and Herodotus. We learn from Plato, though, that even in the 5th century there was a prejudice against the name "sophist". By Aristotle's time, the name bore a contemptuous meaning, as he defines "sophist" as one who reasons falsely for the sake of gain.

With the revival of Greek eloquence, from about the beginning of the second century CE., the name "sophist" attained a new distinction. At that time the name was given to the professional orators, who appeared in public with great pomp and delivered declamations either prepared beforehand or improvised on the spot. Like the earlier sophists, they went generally from place to

place, and were overwhelmed with applause and with marks of distinction by their contemporaries, including the Roman Emperors. Dion Chrysostom, Herodes Atticus, Aristides, Lucian, and Philostratus the Elder belong to the flourishing period of this second school of sophists, a period which extends over the entire second century. They appear afresh about the middle of the fourth century, devoting their philosophic culture to the zealous but unavailing defense of paganism. Among them was the emperor Julian and his contemporaries Libanius, Himerius, and Themistius. Synesius may be considered the last sophist of importance.

Herbert Spencer (1820-1903)

British philosopher and sociologist, Herbert Spencer was a major figure in the intellectual life of the Victorian era. He was one of the principal proponents of evolutionary theory in the mid nineteenth century, and his reputation at the time rivaled that of Charles Darwin. Spencer was initially best known for developing and applying evolutionary theory to philosophy, psychology and the study of society --what he called his "synthetic philosophy" (see his *A System of Synthetic Philosophy*, 1862-93). Today, however, he is usually remembered in philosophical circles for his political thought, primarily for his defense of natural rights and for criticisms of utilitarian positivism, and his views have been invoked by 'libertarian' thinkers such as Robert Nozick.

Life

Spencer was born in Derby, England on 27 April 1820, the eldest of nine children, but the only one to survive infancy. He was the product of an undisciplined, largely informal education. His father, George, was a school teacher, but an unconventional man, and Spencer's family were Methodist 'Dissenters,' with Quaker sympathies. From an early age, Herbert was strongly influenced by the individualism and the anti-establishment and anti-clerical views of his father, and the Benthamite radical views of his uncle Thomas. Indeed, Spencer's early years showed a good deal of resistance to authority and independence.

A person of eclectic interests, Spencer eventually trained as a civil engineer for railways but, in his early 20s, turned to journalism and political writing. He was initially an advocate of many of the causes of philosophic radicalism and some of his ideas (e.g., the definition of 'good' and 'bad' in terms of their pleasurable or painful consequences, and his adoption of a version of the 'greatest happiness principle') show similarities to utilitarianism.

From 1848 to 1853, Spencer worked as a writer and subeditor for *The Economist* financial weekly and, as a result, came into contact with a number of political controversialists such as George Henry Lewes, Thomas Carlyle, Lewes' future lover George Eliot (Mary Ann Evans [1819-1880])--with whom Spencer had himself had a lengthy (though purely intellectual) association--and T.H. Huxley (1825-1895). Despite the diversity of opinions to which he was exposed, Spencer's unquestioning confidence in his own views was coupled with a stubbornness and a refusal to read authors with whom he disagreed.

In his early writings, Spencer defended a number of radical causes-- particularly on land nationalization, the extent to which economics should reflect a policy of *laissez-faire*, and the place and role of women in society--though he came to abandon most of these causes later in his life.

In 1851 Spencer's first book, *Social Statics, or the Conditions Essential to Human Happiness* appeared. ('Social statics'--the term was borrowed from Auguste Comte--deals with the conditions of social order, and was preliminary to a study of human progress and evolution--i.e., 'social dynamics.') In this work,

Spencer presents an account of the development of human freedom and a defense of individual liberties, based on a (Lamarckian-style) evolutionary theory.

Upon the death of his uncle Thomas, in 1853, Spencer received a small inheritance which allowed him to devote himself to writing without depending on regular employment.

In 1855, Spencer published his second book, *The Principles of Psychology*. As in *Social Statics*, Spencer saw Bentham and Mill as major targets, though in the present work he focussed on criticisms of the latter's associationism. (Spencer later revised this work, and Mill came to respect some of Spencer's arguments.*) The Principles of Psychology* was much less successful than *Social Statics*, however, and about this time Spencer began to experience serious (predominantly mental) health problems that affected him for the rest of his life. This led him to seek privacy, and he increasingly avoided appearing in public. Although he found that, because of his ill health, he could write for only a few hours each day, he embarked upon a lengthy project--the nine-volume *A System of Synthetic Philosophy* (1862-93)--which provided a systematic account of his views in biology, sociology, ethics and politics. This 'synthetic philosophy' brought together a wide range of data from the various natural and social sciences and organized it according to the basic principles of his evolutionary theory.

Spencer's *Synthetic Philosophy* was initially available only through private subscription, but he was also a contributor to the leading intellectual magazines and newspapers of his day. His fame grew with his publications, and he counted among his admirers both radical thinkers and prominent scientists, including John Stuart Mill and the physicist, John Tyndall. In the 1860s and 1870s, for example, the influence of Spencer's evolutionary theory was on a par with that of Charles Darwin.

In 1883 Spencer was elected a corresponding member of philosophical section of the French academy of moral and political sciences. His work was also particularly influential in the United States, where his book, *The Study of Sociology*, was at the center of a controversy (1879-80) at Yale University between a professor, William Graham Sumner, and the University's president, Noah Porter. Spencer's influence extended into the upper echelons of American society and it has been claimed that, in 1896, "three justices of the Supreme Court were avowed 'Spencerians'." His reputation was at its peak in the 1870s and early 1880s, and he was nominated for the Nobel Prize for Literature in 1902. Spencer, however, declined most of the honors he was given.

Spencer's health significantly deteriorated in the last two decades of his life, and he died in relative seclusion, following a long illness, on December 8, 1903.

Within his lifetime, some one million copies of his books had been sold, his work had been translated into French, German, Spanish, Italian, and Russian, and his ideas were popular in a number of other countries such as Poland (e.g., through the work of the positivist, Wladyslaw Kozlowski). Nevertheless, by the end of his life, his political views were no longer as popular as they had once been, and the dominant currents in liberalism allowed for a more interventionist state.

Method

Spencer's method is, broadly speaking, scientific and empirical, and it was influenced significantly by the positivism of Auguste Comte. Because of the empirical character of scientific knowledge and because of his conviction that that which is known--biological life--is in a process of evolution, Spencer held that knowledge is subject to change. Thus, Spencer writes, "In science the important thing is to modify and

change one's ideas as science advances." As scientific knowledge was primarily empirical, however, that which was not 'perceivable' and could not be empirically tested could not be known. (This emphasis on the knowable as perceivable led critics to charge that Spencer fails to distinguish perceiving and conceiving.) Nevertheless, Spencer was not a skeptic.

Spencer's method was also synthetic. The purpose of each science or field of investigation was to accumulate data and to derive from these phenomena the basic principles or laws or 'forces' which gave rise to them. To the extent that such principles conformed to the results of inquiries or experiments in the other sciences, one could have explanations that were of a high degree of certainty. Thus, Spencer was at pains to show how the evidence and conclusions of each of the sciences is relevant to, and materially affected by, the conclusions of the others.

Human Nature

In the first volume of *A System of Synthetic Philosophy*, entitled *First Principles* (1862), Spencer argued that all phenomena could be explained in terms of a lengthy process of evolution in things. This 'principle of continuity' was that homogeneous organisms are unstable, that organisms develop from simple to more complex and heterogeneous forms, and that such evolution constituted a norm of progress. This account of evolution provided a complete and 'predetermined' structure for the kind of variation noted by Darwin--and Darwin's respect for Spencer was significant.

But while Spencer held that progress was a necessity, it was 'necessary' only overall, and there is no teleological element in his account of this process. In fact, it was Spencer, and not Darwin, who coined the phrase "survival of the fittest," though Darwin came to employ the expression in later editions of the *Origin of Species*. (That this view was both ambiguous --for it was not clear whether one had in mind the 'fittest' individual or species--and far from universal was something that both figures, however, failed to address.)

Spencer's understanding of evolution included the Lamarckian theory of the inheritance of acquired characteristics and emphasized the direct influence of external agencies on the organism's development. He denied (as Darwin had argued) that evolution was based on the characteristics and development of the organism itself and on a simple principle of natural selection.

Spencer held that he had evidence for this evolutionary account from the study of biology (see *Principles of Biology*, 2 vols. [1864-7]). He argued that there is a gradual specialization in things--beginning with biological organisms--towards self-sufficiency and individuation. Because human nature can be said to improve and change, then, scientific--including moral and political-- views that rested on the assumption of a stable human nature (such as that presupposed by many utilitarians) had to be rejected. 'Human nature' was simply "the aggregate of men's instincts and sentiments" which, over time, would become adapted to social existence. Spencer still recognized the importance of understanding individuals in terms of the 'whole' of which they were 'parts,' but these parts were mutually dependent, not subordinate to the organism as a whole. They had an identity and value on which the whole depended--unlike, Spencer thought, that portrayed by Hobbes.

For Spencer, then, human life was not only on a continuum with, but was also the culmination of, a lengthy process of evolution. Even though he allowed that there was a parallel development of mind and body, without reducing the former to the latter, he was opposed to dualism and his account of mind and of the functioning of the central nervous system and the brain was mechanistic.

Although what characterized the development of organisms was the 'tendency to individuation' (*Social Statics* [1851], p. 436), this was coupled with a natural inclination in beings to pursue whatever would preserve their lives. When one examines human beings, this natural inclination was reflected in the characteristic of rational self-interest. Indeed, this tendency to pursue one's individual interests is such that, in primitive societies, at least, Spencer believed that a prime motivating factor in human beings coming together was the threat of violence and war.

Paradoxically, perhaps, Spencer held an 'organic' view of society. Starting with the characteristics of individual entities, one could deduce, using laws of nature, what would promote or provide life and human happiness. He believed that social life was an extension of the life of a natural body, and that social 'organisms' reflected the same (Lamarckian) evolutionary principles or laws as biological entities did. The existence of such 'laws,' then, provides a basis for moral science and for determining how individuals ought to act and what would constitute human happiness.

Religion

As a result of his view that knowledge about phenomena required empirical demonstration, Spencer held that we cannot know the nature of reality in itself and that there was, therefore, something that was fundamentally "unknowable." (This included the complete knowledge of the nature of space, time, force, motion, and substance.)

Since, Spencer claimed, we cannot know anything non-empirical, we cannot know whether there is a God or what its character might be. Though Spencer was a severe critic of religion and religious doctrine and practice--these being the appropriate objects of empirical investigation and assessment--his general position on religion was agnostic. Theism, he argued, cannot be adopted because there is no means to acquire knowledge of the divine, and there would be no way of testing it. But while we cannot know whether religious beliefs are true, neither can we know that (fundamental) religious beliefs are false.

Moral Philosophy

Spencer saw human life on a continuum with, but also as the culmination of, a lengthy process of evolution, and he held that human society reflects the same evolutionary principles as biological organisms do in their development. Society--and social institutions such as the economy--can, he believed, function without external control, just as the digestive system or a lower organism does (though, in arguing this, Spencer failed to see the fundamental differences between 'higher' and 'lower' levels of social organization). For Spencer, all natural and social development reflected 'the universality of law'. Beginning with the 'laws of life', the conditions of social existence, and the recognition of life as a fundamental value, moral science can deduce what kinds of laws promote life and produce happiness. Spencer's ethics and political philosophy, then, depends on a theory of 'natural law,' and it is because of this that, he maintained, evolutionary theory could provide a basis for a comprehensive political and even philosophical theory.

Given the variations in temperament and character among individuals, Spencer recognized that there were differences in what happiness specifically consists in (*Social Statics* [1851], p. 5). In general, however, 'happiness' is the surplus of pleasure over pain, and 'the good' is what contributes to the life and development of the organism, or--what is much the same--what provides this surplus of pleasure over pain. Happiness, therefore, reflects the complete adaptation of an individual organism to its

environment--or, in other words, 'happiness' is that which an individual human being naturally seeks.

For human beings to flourish and develop, Spencer held that there must be as few artificial restrictions as possible, and it is primarily freedom that he, *contra* Bentham, saw as promoting human happiness. While progress was an inevitable characteristic of evolution, it was something to be achieved only through the free exercise of human faculties (see *Social Statics*).

Society, however, is (by definition, for Spencer) an aggregate of individuals, and change in society could take place only once the individual members of that society had changed and developed (*The Study of Sociology*, pp. 366-367). Individuals are, therefore, 'primary,' individual development was 'egoistic,' and associations with others largely instrumental and contractual.

Still, Spencer thought that human beings exhibited a natural sympathy and concern for one another; there is a common character and there are common interests among human beings that they eventually come to recognize as necessary not only for general, but for individual development. (This reflects, to an extent, Spencer's organicism.) Nevertheless, Spencer held that 'altruism' and compassion beyond the family unit were sentiments that came to exist only recently in human beings.

Spencer maintained that there was a natural mechanism--an 'innate moral sense'--in human beings by which they come to arrive at certain moral intuitions and from which laws of conduct might be deduced (*The Principles of Ethics*, I [1892], p. 26). Thus one might say that Spencer held a kind of 'moral sense theory' (*Social Statics*, pp. 23, 19). (Later in his life, Spencer described these 'principles' of moral sense and of sympathy as the 'accumulated effects of instinctual or inherited experiences.') Such a mechanism of moral feeling was, Spencer believed, a manifestation of his general idea of the 'persistence of force.' As this persistence of force was a principle of nature, and could not be created artificially, Spencer held that no state or government could promote moral feeling any more than it could promote the existence of physical force. But while Spencer insisted that freedom was the power to do what one desired, he also held that what one desired and willed was wholly determined by "an infinitude of previous experiences" (*The Principles of Psychology*, pp. 500-502.) Spencer saw this analysis of ethics as culminating in an 'Absolute Ethics,' the standard for which was the production of pure pleasure--and he held that the application of this standard would produce, so far as possible, the greatest amount of pleasure over pain in the long run.

Spencer's views here were rejected by Mill and Hartley. Their principal objection was that Spencer's account of natural 'desires' was inadequate because it failed to provide any reason *why* one ought to have the feelings or preferences one did.

There is, however, more to Spencer's ethics than this. As individuals become increasingly aware of their individuality, they also become aware of the individuality of others and, thereby, of the *law of equal freedom*. This 'first principle' is that 'Every man has freedom to do all that he wills, provided he infringes not the equal freedom of any other man' (*Social Statics*, p. 103). One's 'moral sense,' then, led to the recognition of the existence of individual rights, and one can identify strains of a rights-based ethic in Spencer's writings.

Spencer's views clearly reflect a fundamentally 'egoist' ethic, but he held that rational egoists would, in the pursuit of their own self interest, not conflict with one another. Still, to care for someone who has no direct relation to oneself--such as supporting the un- and under employed--is, therefore, not only not in one's self interest, but encourages laziness and works against evolution. In this sense, at least, social

inequity was explained, if not justified, by evolutionary principles.

Political Philosophy

Despite his egoism and individualism, Spencer held that life in community was important. Because the relation of parts to one another was one of mutual dependency, and because of the priority of the individual 'part' to the collective, society could not do or be anything other than the sum of its units. This view is evident, not only in his first significant major contribution to political philosophy, *Social Statics*, but in his later essays--some of which appear in later editions of *The Man versus the State*.

As noted earlier, Spencer held an 'organic' view of society, Nevertheless, as also noted above, he argued that the natural growth of an organism required 'liberty'--which enabled him (philosophically) to justify individualism and to defend the existence of individual human rights. Because of his commitment to the 'law of equal freedom' and his view that law and the state would of necessity interfere with it, he insisted on an extensive policy of *laissez faire*. For Spencer, 'liberty' "is to be measured, not by the nature of the government machinery he lives under [...] but by the relative paucity of the restraints it imposes on him" (*The Man versus the State* [1940], p. 19); the genuine liberal seeks to repeal those laws that coerce and restrict individuals from doing as they see fit. Spencer followed earlier liberalism, then, in maintaining that law is a restriction of liberty and that the restriction of liberty, in itself, is evil and justified only where it is necessary to the preservation of liberty. The only function of government was to be the policing and protection of individual rights. Spencer maintained that education, religion, the economy, and care for the sick or indigent were not to be undertaken by the state.

Law and public authority have as their general purpose, therefore, the administration of justice (equated with freedom and the protection of rights). These issues became the focus of Spencer's later work in political philosophy and, particularly, in *The Man versus the State*. Here, Spencer contrasts early, classical liberalism with the liberalism of the 19th century, arguing that it was the latter, and not the former, that was a "new Toryism"--the enemy of individual progress and liberty. It is here as well that Spencer develops an argument for the claim that individuals have rights, based on a 'law of life'. (Interestingly, Spencer acknowledges that rights are not inherently moral, but become so only by one's recognition that for them to be binding on others the rights of others must be binding on oneself--this is, in other words, a consequence of the 'law of equal freedom.') He concluded that everyone had basic rights to liberty 'in virtue of their constitutions' as human beings (*Social Statics*, p. 77), and that such rights were essential to social progress. (These rights included rights to life, liberty, property, free speech, equal rights of women, universal suffrage, and the right 'to ignore the state'--though Spencer reversed himself on some of these rights in his later writings.) Thus, the industrious--those of character, but with no commitment to existing structures except those which promoted such industry (and, therefore, not religion or patriotic institutions)--would thrive. Nevertheless, all industrious individuals, Spencer believed, would end up being in fundamental agreement.

Not surprisingly, then, Spencer maintained that the arguments of the early utilitarians on the justification of law and authority and on the origin of rights were fallacious. He also rejected utilitarianism and its model of distributive justice because he held that it rested on an egalitarianism that ignored desert and, more fundamentally, biological need and efficiency. Spencer further maintained that the utilitarian account of the law and the state was also inconsistent---that it tacitly assumed the existence of claims or rights that have both moral and legal weight independently of the positive law. And, finally, Spencer argues as well against parliamentary, representative government, seeing it as exhibiting a virtual "divine

right"---i.e., claiming that "the majority in an assembly has power that has no bounds." Spencer maintained that government action requires not only individual consent, but that the model for political association should be that of a "joint stock company", where the 'directors' can never act for a certain good except on the explicit wishes of its 'shareholders'. When parliaments attempt to do more than protect the rights of their citizens by, for example, 'imposing' a conception of the good--be it only on a minority--Spencer suggested that they are no different from tyrannies.

Assessment

Spencer has been frequently accused of inconsistency; one finds variations in his conclusions concerning land nationalization and reform, the rights of children and the extension of suffrage to women, and the role of government. Moreover, in recent studies of Spencer's theory of social justice, there is some debate whether justice is based primarily on desert or on entitlement, whether the 'law of equal freedom' is a moral imperative or a descriptive natural law, and whether the law of equal freedom is grounded on rights, utility, or, ultimately, on 'moral sense'. Nevertheless, Spencer's work has frequently been seen as a model for later 'libertarian' thinkers, such as Robert Nozick, and he continues to be read--and is often invoked--by 'libertarians' on issues concerning the function of government and the fundamental character of individual rights.

Benedict (Baruch) Spinoza (1632-1677)

LIFE. Benedict (Baruch) Spinoza (1632-1677) was the son of a Jewish merchant from Amsterdam. His father and grandfather were originally Spanish crypto-Jews -- that is, Jews who were forced to adopt Christianity in post-Islamic Spain, but secretly remained Jewish. He was educated in traditional Jewish Curriculum. His father died when he was 21, after which he was embroiled in a lawsuit with his stepsister over his father's estate. Spinoza won the suit, but nevertheless handed virtually all of it over to his stepsister. Shortly after, Spinoza's budding theological speculations prompted conflict with Jewish leaders. Spinoza publicly contended that the scriptures do not maintain that God has no body, that angels exist, or that the soul is immortal. After failed attempts to silence him, he was excommunicated in 1656. For a time Spinoza was associated with a former Jesuit who ran a school for children. Spinoza used this as an opportunity to further his own education and to supplement his income by teaching in the school. At this time he also learned the trade of lens grinding for glasses and telescopes.

In his late twenties, he supervised a discussion group on philosophical and theological issues. As his own ideas developed, he went on retreat from Amsterdam for three years to formulate them in writing. At a cottage in Rijnsburg, he wrote *A Short Treatise on God, Man and his Well-Being*, and *On the Improvement of the Understanding*. He also composed a geometric version of Descartes' Principles of Philosophy, which friends encouraged him to publish. Part of the purpose of the work was to pave the way for publishing his own thoughts which were critical of Cartesianism. By producing such a work, he could not be accused later of not understanding Descartes. The work appeared in 1663 and was the only writing of Spinoza's published with his name on it during his life. Further developing his own ideas, over the next two years Spinoza composed his greatest work, *The Ethics*. In 1663 Spinoza left Rijnsburg and moved near The Hague. Hoping to publish the *Ethics*, and anticipating controversy, he wrote and published anonymously his *Tractatus Thologico-Politicus* (1670) which defends the liberty to philosophize in the face of religious or political interference. After a self-initiated and failed diplomatic mission to France, Spinoza and he was forced to give up hopes of publishing the *Ethics*. He died in 1677 from a lung disease, the result of breathing dust from lens grinding.

PART ONE OF THE ETHICS

SPINOZA'S PANTHEISM AND METHOD IN THE ETHICS. As directed in Spinoza's Will, the *Ethics* was published posthumously along with some of his other works (1677). The *Ethics* is about 200 pages in length and in five parts:

1. **Concerning God**
2. **The Nature and Origin of the Human Mind**
3. **The Nature and Origin of the Emotions**
4. **Human Bondage, or the Strength of the Emotions**

5. The Power of the Understanding, or Human Freedom

Its most visibly distinguishing feature is its style of composition modeled after Euclid's geometry. Each of the five parts opens with a brief list of definitions and axioms, and from these a series of propositions (or theorems) are deduced. Spinoza initially composed the first parts of the *Ethics* in dialog form, but rejected this for the more precise -- and unfortunately more difficult -- geometric method. In general, geometric proofs are designed so that if we accept the definitions and axioms at the outset, and deductions from these are properly made, then we must accept the concluded propositions. However, as Leibniz observed, even though Spinoza's system follows this style, it nevertheless lacks mathematical rigor. Consequently, we must look at the content of Spinoza's complete system and accept or reject it on its own merits, rather than from the success of the various deductions.

In Part One of the *Ethics*, "Concerning God," after presenting a short list of definitions and axioms, Spinoza deduces 36 propositions which explain the nature of God. The most important of these is Proposition 14, which expresses Spinoza's pantheism: "Besides God, no substance can be granted or conceived." The term "pantheism" (literally all-God) means that God is identical to the universe as a whole. For example my car, my house, and even I myself are all parts of God. Other Western philosophers before Spinoza advocated pantheism, including Xenophanes, Parmenides, Plotinus, and Meister Eckhardt. However, the vast majority of Western philosophers and theologians strongly rejected this view in favor of a transcendent concept of God which holds that God is distinct from his creation. Indeed, some theologians maintained that God has the attribute of separateness thus being completely separate from the rest of the universe, including the physical world and humans. Spinoza's argument for pantheism in Proposition 14 is as follows:

> Proposition 5. There cannot exist in the universe two or more substances having the same nature or attribute.
> Proposition 11: God (defined as a substance consisting of infinite attributes, of which each expresses eternal and infinite essentiality) necessarily exists.
> Therefore, Proposition 14: Besides God, no substance can be granted or conceived.

The intuition behind Spinoza's argument above can be expressed simply. Two separate substances cannot share the same attributes (P 5). God has every actual and possible attribute (P 11). Thus, no other substance can exist. To illustrate Spinoza's point, imagine an infinitely long list of qualities such as "consiousness" and "three-dimensionality." For Spinoza, each attribute on this list can be assigned to only one substance or thing. So, substance 1 might exclusively have the attribute of "consciousness," and substance 2 might exclusively have the attribute of "three-dimensionality." However, God has already been assigned all attributes on the list, and no attributes are left to assign to other substances. Since a substance can't exist if it doesn't have any attributes, then God is the only substance which exists.

As noted, Spinoza opens part one of the *Ethics* with a list of definitions and axioms. His list of definitions are as follows:

1. By that which is self-caused, I mean that of which the essence involves existence, or that of which the nature is only conceivable as existent.
2. A thing is called finite after its kind, when it can be limited by another thing of the same nature; for instance, a body is called finite because we always conceive another greater body. So, also, a thought is limited by another thought, but a body is not limited by thought, nor a thought by body.

3. By substance, I mean that which is in itself, and is conceived through itself: in other words, that of which a conception can be formed independently of any other conception.
4. By attribute, I mean that which the intellect perceives as constituting the essence of substance.
5. By mode, I mean the modifications of substance, or that which exists in, and is conceived through, something other than itself.
6. By God, I mean a being absolutely infinite -- that is, a substance consisting in infinite attributes, of which each expresses eternal and infinite essentiality. ...
7. That thing is called free, which exists solely by the necessity of its own nature, and of which the action is determined by itself alone. On the other hand, that thing is necessary, or rather constrained, which is determined by something external to itself to a fixed and definite method of existence or action.
8. By eternity, I mean existence itself, in so far as it is conceived necessarily to follow solely from the definition of that which is eternal.

Initially, the most important of the definitions below are those of substance, attribute, and mode. Substance, for Spinoza, turns out to be the totality of the universe. An attribute is an all-encompassing property of the universe, such as being three dimensional. Spinoza commentators give various explanations of "attribute" and its relation to "substance." Jonathan Bennett notes that that "An attribute for Spinoza is a basic way of being -- a property which sprawls across everything... [that pertains to that substance]." Edwin Curley notes that for Spinoza the totality of a thing's attributes constitutes its substance. A mode (or modification) is a more confined property of the universe, or how an attribute appears on a smaller level. For example, the shape of a tree is a modification of the universe's larger attribute "three-dimensionality."

Like definitions, axioms are also foundational elements from which propositions are derived. Rather than defining key terms, though, Spinoza's axioms stipulate some foundational fact about the world.

1. Everything which exists, exists either in itself or in something else.
2. That which cannot be conceived through anything else must be conceived through itself.
3. From a given definite cause and effect necessarily follows; and, on the other hand, if no definite cause be granted, it is impossible that an effect can follow.
4. The knowledge of an effect depends on and involves the knowledge of a cause.
5. Things which have nothing in common cannot be understood, the one by means of the other; the conception of one does not involve the conception of the other.
6. A true idea must correspond with its ideate or object.
7. If a thing can be conceived as non-existing, its essence does not involve existence.

GOD IS THE ONLY SUBSTANCE. The first step in Spinoza's argument for pantheism is to prove Proposition 5 that two substances cannot share the same attribute. The only way to distinguish two substances is by noting differences in their attributes or differences in their modes. Suppose, though, that two substances had the same attributes, but different modifications. For example, suppose there were two universes in which both were three-dimensional (i.e. same attribute) but

one had trees and the other did not (i.e. differing modes). Spinoza argues that these differences in modification are not relevant. A substance has its own identity before it is modified. That is, the universe is what it is before it has trees or not. Thus, the only properties which truly distinguish one substance from another are broad attributes, not narrow modes. Thus, if two universes have precisely the same attributes, then they are the same universe.

Spinoza's next task is to prove the existence of God (Proposition 11). The central premise in his argument is Proposition 7: existence belongs to the nature of substance. He concedes that readers may have difficulty in comprehending Proposition 7. We see natural objects such as trees come into and go out of existence, and we assume that substances also come into and go out of existence. Spinoza argues that we would not make this confusion if we kept in mind the difference between modes and substances. Modes, such as properties of trees, do indeed come and go out of existence. Spinoza continues noting that we can also conceive of non-existent modes such as the properties of a unicorns. Again, though, we cannot conceive of a non-existent substance. Continuing with background material for his proof of God, Spinoza argues that an absolutely infinite substance has infinite attributes, each of which must be conceived through itself. Having made these points, Spinoza offers his proof for God:

> **Prop. XI. God, or substance, consisting of infinite attributes, of which each expresses eternal and infinite essentiality, necessarily exists.**
> **Proof. -- If this be denied, conceive, if possible, that God does not exist: then his essence does not involve existence. But this (by Prop. vii.) is absurd. Therefore God necessarily exists. ...**

Spinoza's proof is an ontological argument in the style of Anslem's and Descartes'. Like Anselm, Spinoza gives his argument in the form of a reductio ad absurdum:

1. **(a) The idea of God is that of substance with infinite attributes, each of which is eternally and infinitely essential (Def. 6)**
2. **(b) Suppose that God does not exist**
3. **(c) Then existence is not part of his essence**
4. **(d) However, existence belongs to the nature of a substance**
5. **(e) Therefore, God exists**

More simply, his argument is that God exists since (a) God is a substance, and (b) existence belongs to the nature of a substance. Spinoza continues by giving three additional proofs for God's existence (which will not be explored here). All four proofs are based on the common notion that God's existence necessarily follows from his nature.

Having proved that (a) no two substances can have the same attributes (Proposition 5), and (b) God exists with infinite attributes (Proposition 11), Spinoza proceeds to conclude that God is the only substance (Proposition 14). Again, The proof for this is as follows:

1. **(a) There cannot exist in the universe two or more substances having the same nature or attribute (Proposition 5)**
2. **(b) God (defined as a substance consisting of infinite attributes, of which each expresses eternal and infinite essentiality) necessarily exists (Proposition 11)**
3. **(c) Therefore, besides God, no substance can be granted or conceived (Proposition 14).**

Spinoza continues by making clear that Proposition 14 implies pantheism.

- **Corollary I -- Clearly, therefore: 1. God is one, that is (by Def. vi.) only one substance can be granted in the universe, and that substance is absolutely infinite, as we have already indicated (in the note to Prop. x.).**
- **Corollary II. -- It follows: 2. That extension and thought are either attributes of God or (by Ax. i.) accidents (affectiones) of the attributes of God.**
- **Prop. XV. Whatsoever is, is in God, and without God nothing can be, or be conceived.**

If all things are part of God, then the three-dimensional universe itself is part of God. This means that, in some sense, God has a body. However, Spinoza criticizes those who anthropomorphize the nature of God's body by maintaining that it is finite, and even susceptible to having emotions (given the fact that human emotions are the result of a human body). Spinoza harshly rejects both of these limitations on God's physical nature. However, the vast majority of western philosophers reject the notion that God has a three-dimensional body of any sort. He presents two traditional criticisms of the view that God has a body. First, there are absurdities involved when we consider quantity to be infinite. For example, one foot has twelve times the infinite number of points that one inch does. Second. God is active, and divided matter is passive. The two are thus incompatible. In response, Spinoza argues that the key error in all of these arguments is the assumption that extended substance is composed of parts. Instead, he maintains that the notion of extended substance must be drawn from the more foundational notion of infinite quality, and infinite quality cannot be measured.

In the remainder of Part I of the *Ethics*, Spinoza derives various properties of God. He summarizes these properties in the opening paragraph of the Appendix to Part I.

> **Appendix. In the foregoing I have explained the nature and properties of God. I have shown that (1) he necessarily exists, (2) that he is one, (3) that he is, and acts solely by the necessity of his own nature, (4) that he is the free cause of all things, and how he is so, (5) that all things are in God, and so depend on him, that without him they could neither exist nor be conceived, and (6) that all things are predetermined by God, not through his free will or absolute fiat, but from the very nature of God or infinite power. I have further, where occasion offered, taken caret to remove the prejudices which might impede the comprehension of my demonstrations. Yet there still remain misconceptions, not a few which might and may prove very grave hindrances to the understanding of the ordering of things, as I have explained it above. I have therefore thought it worth while to bring these misconceptions before the bar of reason.**

The principal misconception about God that Spinoza wants to address in the Appendix is that God acts purposefully and directs events in nature towards a definite goal. For Spinoza, God does not do this.

GOD DOES NOT WILLFULLY DIRECT THE COURSE OF NATURE. To make his case that God does not willfully direct the course of nature, he first explains why people think that God acts with a purpose. First, he notes that individual humans do not act freely, but are under the illusion that they do We are ignorant of the true causes of things, but only aware of our own desire to pursue what is useful us. Thus, we think we are free and that all our actions are guided by what is useful to us. Given this tendency to see human behavior as willful and purposeful, we continue by imposing willful purposes on events outside of us. We conclude that God willfully guides external events for our benefit (since we cannot guide it ourselves). Religious superstitions arose as humans found their own ways of worshipping God. Problems of consistency also arose as people insisted

that everything in nature is done by God for a purpose. Since natural disasters conflict with the view that God acts with a purpose, we then say that God's judgment transcends human understanding. For Spinoza, mathematics offers a standard of truth which refutes the view that God acts with a purpose.

Spinoza next argues that God does not act from a purpose. He first argues that the concept of a perfect final goal is flawed. For Spinoza, the most perfect of God's acts are those closest to him. Succeeding events further down the chain are more imperfect. Thus if a given chain of events culminated in sunny weather, for example, that would be less perfect than the initial events in the chain. Belief in final causes compromizes God's perfection since it implies that he desires something which he lacks. For Spinoza, the theologian's contention that God willfully directs all natural events amounts to a reduction to ignorance. That is, all natural events trace back to God's will, and we are all ignorant of God's will. Theologians insist on this path of ignorance since it preserves their authority

Finally, Spinoza maintains that belief in God's willful guidance of nature gives rise to an erroneous notion of value judgments, such as goodness, order, and beauty. These values are presumed to be objective abstract notions imposed on nature by God for our benefit. For example, objective foundation of goodness is that which is conducive to the worship of God. However, Spinoza contends that all of these value judgments in fact arise out of our own human construction and human preferences. For example, things are well-ordered when they require little imagination and are easily remembered. He sees that this is also the case with beauty, fragrance, and harmony. The variety of controversies we have on these topics arise from our differing human constructions. Why is it, we may ask, that God created us in such a way that values are based on human construction, rather than reason? Spinoza's answer is that God figure out an alternative way and had the material to do it.

Leslie Stephen (1832-1904)

Leslie Stephen was a 19th century British philosopher, man of letters, and first editor of the *Dictionary of National Biography*. The portion of his writings which bear upon philosophy is small only in relation to his total literary output. He was born in Kensington Gore on November 28, 1832. In 1842 Stephen's parents moved to Brighton for the sake of his health. He attended a day school, but soon entered Eton College. His parents took a house at Windsor so that he could live at home. Stephen made little progress, and was removed by his father in 1846. He was later sent to King's college, and later entered Cambridge's Trinity Hall in 1850. He won a scholarship in mathematics and gained a reputation as an athlete. He was ordained a deacon in 1855, appointed junior tutor in 1856, and ordained a priest in 1859. In 1862 his position at Cambridge changed. His reading in Mill, Comte, and Kant led him to reject the historical evidences of Christianity. He declined to take part in the chapel services. Thereupon at the Master's request, he resigned his tutorship. Hs skepticism steadily grew, and on in 1875 he relinquished his holy orders. When freed from his tutorial and clerical duties, his interests took a wider range, and he subsequently published in the fields of politics, literary criticism, and social criticism. Religious and philosophical speculation engaged much of his attention, and he presented his views in *Fraser's Magazine*, and *Fortnightly Review*. A collection of religious and philosophical essays entitled *Essays on Free Thinking and Plain Speaking* came out in 1873. The book make him a leader of the agnostic school, and a chief challenger of popular religion, which he charged with being unable to satisfy genuine spiritual needs.

He devoted much of his time to his *History of English Thought in the Eighteenth Century* (1876) in which he explained the arguments of the old English deists and the skepticism of Hume. He places the philosophers and moralists in their due position in the whole literary activity of the period. A further stage of the same history ---*The English Utilitarians* (1900) was completed toward the end of his life. That same year appeared his "An Agnostic's Apology" in the *Fortnightly Review*; this further revealed his private convictions and helped familiarize the public with the term "agnostic" which had been invented in 1870 by Thomas Huxley, but had not yet become in vogue. In 1878 he joined the Metaphysical Society on the eve of its dissolution, and read two papers at its meetings, In 1882 he produced his *Science of Ethics*, in which he summed up his final conclusions on the dominant problems of life, in light of his study of Mill, Darwin, and Spencer. He devoted the remainder of his life to other literary projects and died in 1903 of cancer. After his death his monograph on Hobbes appeared (1904).

The first writers who worked out more general consequences of the theory of evolution were scientists with a philosophical turn of mind. Others outside the sciences soon followed in drawing out the consequences of evolution; Stephen was foremost among these, particularly in the area of the ethics. His own independent contribution is given in *The Science of Ethics* (1882). After Spencer's *Data*, this is the first book which worked out an ethical view determined by the theory of evolution. He followed Mill and Darwin as an ally of the empirical and utilitarian creed; but he

came to see that more extensive changes were necessary. Spencer's compromise between hedonism and evolutionism failed to satisfy him, and he found the ethical bearing of evolution better expressed by the conception of social vitality than by that of pleasure. The great merit of the work consists in its presentation of the social content of morality in the individual mind as well as in the community; but it does not sufficiently recognize the distinction between the historical process traced by the evolution theory and the ethical validity which evolution is assumed to possess.

Stilpo (c.380-330 BCE.)

Stilpo was a Philosopher of Megara and the most distinguished member of the Megarean school. He was not only celebrated for his eloquence and skill in dialectics, but for the success with which he applied to moral precepts of philosophy to the correction of his natural propensities. Though in his youth he had been much addicted to intemperance and licentious pleasures, after he had ranked himself among philosophers he was never known to violate the laws of sobriety or chastity. With respect to riches he exercised a virtuous moderation. When Ptolemy Soter, at the taking of Megara, presented him with a large sum of money, and requested him to accompany him to Egypt, he returned the greater part of the present, and chose to retire, during Ptolemy's stay at Megara, to the island of Aegina. Afterward, when Megara was again taken by Demetrius, son of Antigonus, the conqueror ordered the soldiers to spare the house of Stilpo; and, if anything should be taken from him in the hurry of the plunder, to restore it. So great was the fame of Stilpo, that when he visited Athens, the people ran out of their shops to see him, and even the most eminent philosophers of Athens took pleasure in attending his discourses.

On moral topics Stilpo is said to have taught that the highest happiness consists in a mind free from the dominion of passion, a doctrine similar to that of the Stoics. (Diog. Laert. ii. 113-118; Sen. *Epist.* 9).

James Hutchison Stirling

James Hutchison Stirling was a 19th century British Idealist philosopher. In 1865 Stirling's *The Secret of Hegel* appeared and marked the inauguration of a new era in the development of English idealism. In an article in the *Fortnightly Review* for October 1867 (republished in the volume *Jerrold, Tennyson, and Macaulay*) the author passes a ruthless condemnation upon the spurious reputation for a knowledge of German idealism which had attached itself to the name of Coleridge, as well as, in a minor degree, to that of De Quincey, and fastens especially upon Coleridge's 'dreamy misapprehensions' and 'strange misrepresentations' of the Kantian philosophy. Himself profoundly convinced of the truth of the Hegelian system, he set himself, in the *Secret*, to explain and defend that system. Stirling undoubtedly possessed 'the temperament of genius,' and was a man of remarkable speculative insight; but his style, though often striking, is so marked by the influence of Carlyle, and he so resolutely declines to conform to ordinary standards of systematic exposition, that his work is almost as difficult as the original which it is intended to illuminate. Yet its importance, and its influence at the time of its appearance, are not to be underestimated; it certainly called the attention of the English-speaking world to the significance of a system which even Ferrier had pronounced unintelligible, and brought home to the English mind the necessity of coming to terms, not only with Hegel, but with his predecessors, Kant, Fichte, and Schelling.

Stirling insisted upon going back to the origins of Hegelianism in these earlier systems, and in 1881 he followed up the *Secret of Hegel* with the *Tetbook to Kant*, in which the defects of the earlier work were less apparent and in which he supported a one-sided interpretation of the Kantian philosophy, as represented by the first two divisions of the *Critique of Pure Reason*, with great learning and with remarkable ability. His translation of Schwegler's *History of Philosophy*, published in 1867, which passed through many editions and was used by many generations of students, contains a series of illuminating 'annotations' which rival in interest and value the substance of the *History* itself. A little volume of lectures on *The Philosophy of Law* (1873) and the Gifford lectures on *Philosophy and Theology* (1890) complete the list of Stirling's more important contributions to philosophy. The standpoint is always the same -- that of the Hegelian idealism, which Stirling is inclined to interpret in a theistic rather than in a pantheistic sense.

Stoicism

General Description. The term "Stoicism" derives from the Greek word "stoa," referring to a colonnade, such as those built outside or inside temples, around dwelling-houses, gymnasia, and market-places. They were also set up separately as ornaments of the streets and open places. The simplest form is that of a roofed colonnade, with a wall on one side, which was often decorated with paintings. Thus in the market-place at Athens the stoa poikile (Painted Colonnade) was decorated with Polygnotus's representations of the destruction of Troy, the fight of the Athenians with the Amazons, and the battles of Marathon and Oenoe. Zeno of Citium taught in the *stoa poikile* in Athens, and his adherents accordingly obtained the name of Stoics. Zeno was followed by Cleanthes, and then by Chrysippus, as leaders of the school. The school attracted many adherents, and flourished for centuries, not only in Greece, but later in Rome, where the most thoughtful writers, such as Marcus Aurelius, Seneca, and Epictetus, counted themselves among its followers.

We know little for certain as to what share particular Stoics, Zeno, Cleanthes, or Chrysippus, had in the formation of the doctrines of the school, But after Chryssipus the main lines of the doctrine were complete. The stoic doctrine is divided into three parts: logic, physics, and ethics. Stoicism is essentially a system of ethics which, however, is guided by a logic as theory of method, and rests upon physics as foundation. Briefly, their notion of morality is stern, involving a life in accordance with nature and controlled by virtue. It is an ascetic system, teaching perfect indifference (apathea) to everything external, for nothing external could be either good or evil. Hence to the Stoics both pain and pleasure, poverty and riches, sickness and health, were supposed to be equally unimportant.

Stoic Logic. Stoic logic is, in all essential, the logic of Aristotle. To this, however, they added a theory, peculiar to themselves, of the origin of knowledge and the criterion of truth. All knowledge, they said, enters the mind through the senses. The mind is a blank slate, upon which sense-impressions are inscribed. It may have a certain activity of its own, but this activity is confined exclusively to materials supplied by the physical organs of sense. This theory stands, of course, in sheer opposition to the idealism of Plato, for whom the mind alone was the a source of knowledge, the senses being the source of knowledge, the senses being the sources of all illusion and error. The Stoics denied the metaphysical reality of concepts. Concepts are merely ideas in the mind, abstracted from particulars, and have no reality outside consciousness.

Since all knowledge is a knowledge of sense-objects, truth is simply the correspondence of our impressions to things. How are we to know whether our ideas are correct copies of things? How do we distinguish between reality and imagination, dreams, or illusions? What is the criterion of truth? It cannot lie in concepts, since they are of our own making. Nothing is true save sense impressions, and therefore the criterion of truth must lie in sensation itself. It cannot be in thought, but must be in feeling. Real objects, said the Stoics, produce in us an intense feeling, or conviction, of their reality. The strength and vividness of the image distinguish these real perceptions from a dream or fancy. Hence the sole criterion of truth is this striking conviction, whereby the real forces itself upon our consciousness, and will not be denied. There is, thus, no universally grounded criterion of truth. It is based, not on reason, but on feeling.

Stoic Physics. The fundamental proposition of the Stoic physics is that "nothing incorporeal exists." This materialism coheres with the sense-impression orientation of their doctrine of knowledge. Plato placed knowledge in thought, and reality, therefore, in the ideal form. The Stoics, however, place knowledge in physical sensation, and reality -- what is known by the senses -- is matter. All things, they said, even the soul, even God himself, are material and nothing more than material. This belief they based upon two main considerations. Firstly, the unity of the world demands it. The world is one, and must issue from one principle. We must have a monism. The idealism of Plato resolved itself into a futile struggle involving a dualism between matter and thought. Since the gulf cannot be bridged from the side of ideal realm of the forms, we must take our stand on matter, and reduce mind to it. Secondly, body and soul, God and the world, are pairs which act and react upon one another. The body, for example, produces thoughts (sense impressions) in the soul, the soul produces movements in the body. This would be impossible if both were not of the same substance. The corporeal cannot act on the incorporeal, nor the incorporeal on the corporeal. There is no point of contact. Hence all must be equally corporeal.

All things being material, what is the original kind of matter, or stuff, out of which the world is made? The Stoics turned to Heraclitus for an answer. Fire *logos*) is the primordial kind of being, and all things are composed of fire. With this materialism the Stoics combined pantheism. The primal fire is

God. God is related to the world exactly as the soul to the body. The human soul is likewise fire, and comes from the divine fire. It permeates and penetrates the entire body, and, in order that its interpenetration might be regarded as complete, the Stoics denied the impenetrability of matter. Just as the soul-fire permeates the whole body, so God, the primal fire, pervades the entire world.

But in spite of this materialism, the Stoics declared that God is absolute reason. This is not a return to idealism, and does not imply the incorporeality of God. For reason, like all else, is material. It means simply that the divine fire is a rational element. Since God is reason, it follows that the world is governed by reason, and this means two things. It means, firstly, that there is purpose in the world, and therefore, order, harmony, beauty, and design. Secondly, since reason is law as opposed to the lawless, it means that universe is subject to the absolute sway of law, is governed by the rigorous necessity of cause and effect. Hence the individual is not free. There can be no true freedom of the will in a world governed by necessity. We may, without harm, say that we choose to do this or that, and that our acts are voluntary. But such phrases merely mean that we assent to what we do. What we do is none the less governed by causes, and therefore by necessity.

The world-process is circular. God changes the fiery substance of himself first into air, then water, then earth. So the world arises. But it will be ended by a conflagration in which all things will return into the primal fire. Thereafter, at a pre-ordained time, God will again transmute himself into a world. It follows from the law of necessity that the course taken by this second, and every subsequent, world, will be identical in every way with the course taken by the first world. The process goes on for ever, and nothing new ever happens. The history of each successive world is the same as that of all the others down to the minutest details.

The human soul is part of the divine fire, and proceeds into humans from God. Hence it is a rational soul, and this is a point of cardinal importance in connection with the Stoic ethics. But the soul of each individual does not come direct from God. The divine fire was breathed into the first man, and thereafter passed from parent to child in the act of procreation. After death, all souls, according to some, but only the souls of the good, according to

others, continue in individual existence until the general conflagration in which they, and all else, return to God.

Stoic Ethics. The Stoic ethical teaching is based upon two principles already developed in their physics; first, that the universe is governed by absolute law, which admits of no exceptions; and second, that the essential nature of humans is reason. Both are summed up in the famous Stoic maxim, "Live according to nature." For this maxim has two aspects. It means, in the first place, that men should conform themselves to nature in the wider sense, that is, to the laws of the universe, and secondly, that they should conform their actions to nature in the narrower sense, to their own essential nature, reason. These two expressions mean, for the Stoics, the same thing. For the universe is governed not only by law, but by the law of reason, and we, in following our own rational nature, are *ipso facto* conforming ourselves to the laws of the larger world. In a sense, of course, there is no possibility of our disobeying the laws of nature, for we, like all else in the world, act of necessity. And it might be asked, what is the use of exhorting a person to obey the laws of the universe, when, as part of the great mechanism of the world, we cannot by any possibility do anything else? It is not to be supposed that a genuine solution of this difficulty is to be found in Stoic philosophy. They urged, however, that, though we will in any case do as the necessity of the world compels us, it is given to us alone, not merely to obey the law, but to assent to our own obedience, to follow the law consciously and deliberately, as only a rational being can.

Virtue, then, is the life according to reason. Morality is simply rational action. It is the universal reason which is to govern our lives, not the caprice and self-will of the individual. The wise man consciously subordinates his life to the life of the whole universe, and recognizes himself as a cog in the great machine. Now the definition of morality as the life according to reason is not a principle peculiar to the Stoics. Both Plato and Aristotle taught the same. In fact, it is the basis of every ethic to found morality upon reason, and not upon the particular foibles, feelings, or intuitions, of the individual self. But what was peculiar to the Stoics was the narrow and one-sided interpretation which they gave to this principle. Aristotle had taught that the essential nature of humans is reason, and that morality consists in following this, his essential nature. But he recognized that the passions and appetites have their

place in the human organism. He did not demand their suppression, but merely their control by reason. But the Stoics looked upon the passions as essentially irrational, and demanded their complete extirpation. They envisaged life as a battle against the passions, in which the latter had to be completely annihilated. Hence their ethical views end in a rigorous and unbalanced asceticism.

Aristotle, in his broad and moderate way, though he believed virtue alone to possess intrinsic value, yet allowed to external goods and circumstances a place in the scheme of life. The Stoics asserted that virtue alone is good, vice alone evil, and that all else is absolutely indifferent. Poverty, sickness, pain, and death, are not evils. Riches, health, pleasure, and life, are not goods. A person may commit suicide, for in destroying his life he destroys nothing of value. Above all, pleasure is not a good. One ought not to seek pleasure. Virtue is the only happiness. And people must be virtuous, not for the sake of pleasure, but for the sake of duty. And since virtue alone is good, vice alone evil, there followed the further paradox that all virtues are equally good, and all vices equally evil. There are no degrees.

Virtue is founded upon reason, and so upon knowledge. Hence the importance of science, physics, logic, which are valued not for themselves, but because they are the foundations of morality. The prime virtues, and the root of all other virtues, is therefore wisdom. The wise man is synonymous with the good man. From the root-virtue, wisdom, spring the four cardinal virtues: insight, bravery, self-control, and justice. But since all virtues have one root, those who possess wisdom possess all virtue, and those who lack it lack all. A person is either wholly virtuous, or wholly vicious. The world is divided into wise and foolish people, the former perfectly good, the latter absolutely evil. There is nothing between the two. There is no such thing as a gradual transition from one to the other. Conversion must be instantaneous. the wise person is perfect, has all happiness, freedom, riches, beauty. They alone are the perfect kings, politicians, poets, prophets, orators, critics, and physicians. The fool has all vice, all misery, all ugliness, all poverty. And every person is one or the other. Asked where such a wise person was to be found, the Stoics pointed doubtfully at Socrates and Diogenes the Cynic. The number of the wise, they thought, is small, and is continually growing smaller. The world, which they painted in the blackest colors as a sea of vice

and misery, grows steadily worse.

The similarities between Cynicism and Stoic ethics are apparent. However, the Stoics modified and softened the harsh outlines of Cynicism. To do this meant inconsistency, though. It meant that they first laid down harsh principles, and then proceeded to tone them down, to explain them away, to admit exceptions. Such inconsistency the stoics accepted with their habitual cheerfulness. This process of toning down their first harsh utterances took place mainly in three ways. First, the modified their principle of the complete suppression of the passions. Since this is impossible, and, if possible, could only lead to immovable inactivity, they admitted that the wise person might exhibit certain mild and rational emotions. Thus, the roots of the passions might be found in the wise person, though they would never be allowed to grow. In the second place, they modified their principle that all else, save virtue and vice, is indifferent. Such a view is unreal, and out of accord with life. Hence the stoics, with a masterly disregard of consistency, stuck to the principle, and yet declared that among things indifferent some are preferable to others. If the wise person has the choice between health and sickness, health is preferable. Indifferent things were thus divided into three classes: those to be preferred, those to be avoided, and those which are absolutely indifferent.

In the third place, the stoics toned down the principle that people are either wholly good, or wholly evil. The famous heroes and politicians of history, though fools, are yet polluted with the common vices of humankind less than others. Moreover, what were the Stoics to say about themselves? Were they wise men or fools? They hesitated to claim perfection, to put themselves on a level with Socrates and Diogenes. Yet they could not bring themselves to admit that there was no difference between themselves and the common herd. They were "proficients," and, if not absolutely wise, approximated to wisdom.

Subjectivity

"Subjectivity" is a term used to denote that the truth of some class of statements depends on the mental state or reactions of the person making the statement. Not all uses of the term "subjective" are strictly philosophical, thus in medicine pain might be called subjective if it has no physical basis.

In epistemology, the notion of subjectivity is that knowledge is restricted to one's own perceptions. "Subjectivity of sensory qualities" is the phrase used by those who accept that the qualities experienced by the senses are not something belonging to the physical beings, but are subject to interpretation. This view is based on the limitation of the senses as physical organs. The subject or observer is herself involved in the object of the perception. In metaphysics, subjectivity includes the ideas of solipsism and subjective idealism. The latter notion is expressed in Berkeley's contention that "to be is to be perceived." In ethics and aesthetics, subjectivism is the view that statements about a person's character or an object's beauty are not reports of objective qualities inherent in those things. Instead we are either (cognitively) reporting our own inner feelings and attitudes, or (noncognitively) we are merely expressing our feelings.

Thomas Kuhn argued that "'Subjective' is a term with several established uses: in one of these it is opposed to 'objective,' in another to 'judgmental'" (*Essential Tension*, p. 336). For Kuhn, science is subjective in the first sense, but not in the second. Following Kuhn, Rorty distinguishes between two notions of "subjective": (1) a product only of what is in me, as opposed to out there, and (2) considerations which rational discussants should set aside. Rorty rejects the first notion completely since it is based on a notion of objectivity (correspondence to what is out there) which is impossible to achieve (*Philosophy and the Mirror of Nature*, pp. 338-339).

Sublime

"Sublime" refers to an aesthetic value in which the primary factor is the presence or suggestion of transcendent vastness or greatness, as of power, heroism, extent in space or time. It differs from greatness or grandeur in that these are as such capable of being completely grasped or measured. By contrast, the sublime, while in one aspect apprehended and grasped as a whole, is felt as transcending our normal standards of measurement or achievement. Two elements are emphasized in varying degree by different writers, and probably varying in different observers: (1) a certain baffling of our faculty with feeling of limitation akin to awe and veneration; (2) a stimulation of our abilities and elevation of the self in sympathy with its object.

The element of magnitude in beauty was noted by Aristotle, and given by him a prominent place in tragedy. But the earliest extant determination of the sublime as a distinct conception is in the treatise ascribed to Longinus, but now supposed to be of earlier date (first century C.E.). In modern philosophy, it was given special prominence by Edmund Burke in his *Essay on the Sublime and Beautiful* (1756) and Henry Home in his *Elements of Criticism* who sought a psychological and physiological explanation. According to Burke, it is caused by a "mode of terror or pain," and is contrasted with the beautiful (rather than being part of the beautiful). Kant also distinguished it as a separate category form beauty, making it apply properly only to the mind, not to the object, and giving it a peculiar moral effect in opposing "the interests of sense." He distinguished a mathematical sublime of extension in space or time, and a dynamic of power. Most subsequent writers on aesthetics tend to bring the sublime within the beautiful in the broader sense insofar as its aesthetic quality is closely related to that of beauty.

Suicide

Suicide is defined as an intentional and uncoerced self-killing in which the conditions causing death are self-arranged. The applied ethical issue of suicide focuses on two problems: (a) whether suicide is permissible, and, if so, (b) whether suicide intervention is permissible. The latter problem involves a question of balancing the agent's autonomy against paternalistic concerns of society.

CLASSIC THEORIES ON THE MORALITY OF SUICIDE. Although many applied ethics issues emerged only recently, the issue of the moral permissibility of suicide has a long history of philosophical discussion. . Plato opposed suicide since it "frustrates the decree of destiny" (*Laws*, Bk. 8, 873c); he also argued that "the gods are our guardians, and that we are a possession of theirs. ... Then there may be reason in saying that a man should wait, and not take his own life until God summons him, as he is now summoning me" (*Phaedo*, 62). Aristotle also opposed suicide since it is "contrary to the rule of life" (*Nicomachean Ethics*, Bk. 5, Ch. 11). Later Greek and Roman philosophers approved of suicide as a means of ending suffering. For example, the Roman philosopher Seneca (4 BCE - 65 CE) condones suicide in cases in which age takes its toll on us and prevents us from living as we should:

> **I will not relinquish old age if it leaves my better part intact. But if it begins to shake my mind, if it destroys my faculties one by one, if it leaves me not life but breath, I will depart from the putrid or the tottering edifice. If I know that I must suffer without hope of relief I will depart not through fear of the pain itself but because it prevents all for which I should live. [De Ira, 1:15]**

Stoic philosopher Epictetus (60 CE - 120 CE) also endorses suicide. The principal moral theme of Stoic philosophy is that we should resign ourselves to whatever fate has in store for us. Epictetus suggests that, for some of us, there may be limits to what we can endure in this life and, so, when things get too intolerable, we may wish to end our lives. He describes our options poetically:

... Above all, remember that the door stands open. Do not be more fearful than children. But, just as when they are tired of the game they cry, "I will play no more," so too when you are in a similar situation, cry, "I will play no more" and depart. But if you stay, do not cry.

... Is there smoke in the room? If it is slight, I remain. If it is grievous, I quit it. For you must remember this and hold it fast, that the door stands open. [Discourses, Book 1, Ch. 24, 25]

Attitudes about suicide changed in the writings of Christian philosophers. In *The City of God*, Augustine (354-430) opposes suicide on the grounds that it violates the commandment "thou shalt not kill." Although Augustine notes some exceptions to this rule, such as divinely ordained wars or government sanctioned executions, self-killing is not is not an exception since it lacks any parallel justification. It is not justified because of personal suffering, fear of possible punishment, or even on more lofty grounds such as high-mindedness. For Augustine, the more high-minded person is the one who faces life's ills, rather than escapes them.

In *Summa Theologica*, Thomas Aquinas gives three arguments against the permissibility of suicide. The first argument is based on natural law, or the natural purpose of a thing: suicide is wrong since it is contrary to the natural life asserting purpose of humans. Aquinas's second argument against suicide is a utilitarian type argument: suicide is not justified because of the greater social harm that is done. Aquinas's third argument is that suicide is wrong since it is like stealing from God. Our lives are property that is owned by God, and we are merely the trustees of that property. Renaissance and modern philosophers such as Montaigne, Montesquieu, and Voltaire wrote in favor of suicide, opposing the medieval arguments of divine providence.

David Hume gives one of the most famous philosophical defenses of suicide from this period in his essay "Of Suicide." The essay was printed for publication in 1757 in a collection of five dissertations, but, for reasons of political pressure, Hume pulled dropped the essay on suicide. The work eventually appeared in 1783, seven years after Hume's death. In this essay, Hume approaches the question of suicide from the standpoint of the traditional duty-based ethics championed by Grotius and Pufendorf. If suicide is immoral, then it must violate some duty to God, self, or others. Hume systematically goes through each of these possibilities and concludes that we have no such duty. The bulk of his argument focuses on whether suicide violates duties to God. We can reconstruct Hume's main argument against such a duty as follows:

1. There is a self-rule established by God in two forces of nature (i.e., physical laws of the natural world, and purposeful action of the animal world)
2. As a rule, God has given humans the liberty to alter nature for their own happiness
3. Suicide is an instance of altering the course of nature for our own happiness
4. There is no good reason this instance should be an exception to the rule
5. Therefore, suicide does not violate God's plan

Much of Hume's argument focuses on premise four. One possible criticism to premise four is that human life is uniquely important. In response, Hume argues that in the larger scheme of things our lives are of no greater importance than that of an oyster. Hume also considers the criticism that it is up to God to determine when someone should die. In response, Hume contends that if determining the time of death is entirely up to God, then it would also be wrong to lengthen our lives, such as through medicine. Another possible criticism is that suicide interferes with the natural order of things that God ordains. We build artificial shelters to protect ourselves from harsh weather conditions, we artificially irrigate barren land and we construct artificial means of transportation. Clearly, we interfere with the natural causal order all the time. For Hume, arguments from providence fails because there is no relevant difference between, say, diverting the Nile river from its natural course and taking one's life by diverting blood from its normal channel. Hume also argues that when life becomes so unbearable, an all good God would not prevent us from ending our miseries through suicide.

Concerning whether suicide violates our duty to others, Hume offers a series of arguments, such as the following argument from social reciprocity:

1. When we die, we do not harm society, but only cease to do good
2. Our responsibility to do good is reciprocally related to benefit we receive from society
3. When I am dead, I can no longer receive the benefits
4. Therefore, I do not have a duty to do good

He also argues that I am not obliged to do a small good for society at the expense of a great harm to myself. Using consequentialist reasoning, Hume argues further that if my continued existence is a burden on society, then suicide is permissible. For Hume, most people who kill themselves in such situation. According to Alan Donagan, if Hume were pushed to his logical conclusion, utilitarianism would require social indigents to kill themselves. And this, Donagan believes, is a decisive refutation of Hume's utilitarian defense of suicide, since requiring suicide is a clear violation of the principle of autonomy. Tom Beauchamp defends Hume against Donagan's charge by arguing that (a) Hume is a rule utilitarian, and (b) in normal circumstances, no rule requiring suicide could be established which would produce more good than harm for society. Finally, concerning whether suicide violates a duty to oneself, Hume argues that all suicides have been done for good personal reasons. This is evident since we have such a strong natural fear of death, which requires an equally strong motive to overcome that fear.

In his essay "Suicide," Immanuel Kant argues that suicide is wrong because it degrades our inner worth below that of animals. Kant considers two common justifications of suicide, and rejects them both. First, some may argue that suicide is permissible as a matter of freedom, so long as it does not violate the rights of others. In response Kant says self-preservation is our highest duty to ourselves and we may treat our body as we please, so long as our actions arise from motives of self-preservation. Some also might give examples from history that imply that suicide is sometimes virtuous. For example, in Roman history, Cato, who was a symbol of resistance against Caesar, found he could no longer resist Caesar; to continue living a compromised life would disillusion advocates of freedom. Kant argues that this is the only example of this sort and thus cannot be used as a general rule in defense of suicide. Kant's main argument against suicide is that people are entrusted with their lives, which have a uniquely inherent value. By killing oneself, a person dispenses with his humanity and makes himself into a thing to be treated like a beast. Kant also argues on more consequentialist grounds that if a person is capable of suicide, then he is capable of any crime. For Kant, "he who does not respect his life even in principle cannot be restrained from the most dreadful vices"

SUICIDE INTERVENTION. The central issue of suicide intervention is the distinction between self-killings that are autonomous as opposed to non-autonomous. Non-autonomous self-killings are done involuntarily, or without the person knowing what he is really doing. Philosophers commonly agree that intervention is always justified with attempted non-autonomous self-killings. For autonomous suicides, though, the justification for intervention is less clear. Intervention depends on whether paternalism in general is ever justified. Most simply, "paternalism" is the intentional limitation of a person's autonomy, exclusively for that person's own good. Mill's principle of liberty maintains that paternalism of this sort is never justified. According to Mill, we can only limit a person's conduct when it presents harm to others, irrespective of whether it presents harm to the agent himself. On this view, an initial suicide intervention may be justified, solely to establish whether the attempted suicide was autonomous or non-autonomous. If the attempt was autonomous, then no further intervention is justified.

Decisions about some suicides are complicated in that they take place in hospitals or under the supervision of health care workers. In these situations workers are guided by the Hippocratic oath, which advocates respect for all human life. The justifiability of suicide intervention in such situations rests on which moral consideration is weightier: autonomy or respect for life. Given the unique duties of health care workers, respect for life outweighs the principle of autonomy and suicide intervention is justified in health care settings.

Supererogation

The term "supererogation" refers to good actions done beyond what is morally required. The expression has its roots in Christian theology referring to good works done in a state of grace in excess of the strict requirements of the divine law, and constituting a store of merit which may be used for the benefit of souls in purgatory or for other penitent persons. The Roman Catholic doctrine of supererogation rests on a distinction between what is mandatory and what is merely advisory in the divine law. With reference to the latter, humans are free and may lay up a store of merit which under given circumstances may be applied to the benefit of others. The doctrine involves a point of radical difference between Catholic and Reformed Christian churches, the latter denying the validity of the distinction on which the doctrine of supererogation rests.

Symposium

"Symposium" is the Greek term for a drinking-party. The symposium must be distinguished from the*deipnon*; for though drinking almost always followed a dinner-party, yet the former was regarded as entirely distinct from the latter, was regulated by different customs, and frequently received the addition of many guests who were not present at the dinner. For the Greeks did not usually drink at their dinner, and it was not until the conclusion of the meal that wine was introduced. Symposia were very frequent at Athens. Their enjoyment was heightened by agreeable conversation, by the introduction of music and dancing, and by games and amusements of various kinds; sometimes, too, philosophical subjects were discussed at them. The *Symposia* of Plato and Xenophon give us a lively idea of such entertainments at Athens. The name itself shows that the enjoyment of drinking was the main object of the symposia: wine from the juice of the grape (*oinos ampelinos*) was the only drink partaken of by the Greeks, with the exception of water. The wine was almost invariably mixed with water, and to drink it unmixed (*akraton*) was considered a characteristic of barbarians. The mixture was made in a large vessel called the *crater*, from which it was conveyed into the drinking-cups. The guests at a symposium reclined on couches, and were crowned with garlands of flowers. A master of t have been incidentally noticed above.

Synderesis

"Synderesis" is a technical term from scholastic philosophy, signifying the innate principle in the moral consciousness of every person which directs the agent to good and restrains him from evil. It is first found in a singe passage of St. Jerome (d. 420) in his explanation of the four living creatures in Ezekiel's vision. Jerome explains that most commentators hold that the human, the loin, and the ox of the vision represent the rational, the irascible, and the appetitive (or concupiscent) parts of the soul, according to Plato's division, while the fourth figure, that of the eagle, represents a fourth part of the soul, above and outside these three:

> **This the Greeks call synderesis, which spark of conscience was not extinguished from the breast of Adam when he was driven from Paradise. Through it, when overcome by pleasures or by anger, or even as sometimes deceived by a similitude of reason, we feel that we sin; ... and this in the scriptures is sometimes called spirit.... And yet we perceive that the conscience (conscientia) is itself also thrown aside and driven from its place by some who have no shame or modesty in their faults.**

In this passage no distinction seems to be drawn between synderesis and conscientia. It has even been maintained that the former word is a copyist's error for synderesis, the usual Greek equivalent for "conscientia".

The use of synderesis as distinct from *conscientia* among the scholastics, and to a slight extent among early Protestant moralists, is founded on its description by Jerome as scintilla conscientiae - the spark - from which the light of conscience arises. Thus Jeremy Taylor calls it "the spark or fire put into the heart of humans," while synderesis, which is specifically called conscience of the deed done, is the "bringing fuel to this fire (*Ductor Dubitantium* 1:1:1) As distinguished from synderesis, conscientia is applied by these writers to the particular attitude of a person to good or evil action, and may accordingly be an unsafe guide. Synderesis is thus a faculty or habit (it was disputed which) both of judging and of willing the right, in agreeement with "original righteousness" and persisting in the separate powers of the soul in spite of the corruption of human nature brought about by the Fall. In the earlier descriptions it is spoken of as volitional as well as intellectual. According to Aquinas, however, it is distinctly practical reason - certain principles belonging to the practical side of reason which point out the right direction for action, just as the theoretical axioms of the understanding do for thinking. Both synderesis and conscientia are placed among the intellectual powers. A different view is given by Bonaventura, who makes the whole distinction between conscientia and synderesis rest upon the distinction between judgment and will. God (he says) has implanted a double rule of right in human nature: one for judging rightly, and this is the moral strength of conscience; another for right volition, and this is the moral strength of synderesis, whose function is to dissuade from evil and stimulate to good, and which may therefore be described as the original moral tendency of the disposition.

This, however, does not seem to be either the best or the most prevalent view of scholasticism

regarding synderesis. The question is fully discussed by Duns Scotus, who decided against Bonaventura that both synderesis and conscience belong to practial reason, the former giving the first principles or major premises of its practical syllogisms, the latter corresponding to their conclusions (*In Sent. Reportationes* Bk 2:39, Q1-2). Jeremy Taylor also follows the Thomistic use and makes synderesis "the general repository of moral principles or measures." This is the "rule of conscience," while conscience itself is "a conjunction of the universal practical law with the particular moral action." It applies the rule to the particular case, and is thus both witness and judge of moral actions. It may be noted that the term "conscience," when used (as by Kant) as equivalent to practical reason regarded as infallible, corresponds to the medieval synderesis, and not to the medieval conscientia.

Taste

"Taste" is the 18th and 19th century term of choice referring to the faculty of critical and appreciatory discernment of and judgment upon objects of aesthetic experience. It is often used as synonymous with "good taste". Taste has been recognized by aestheticians as involving at least two distinguishable elements: (1) native sensibility and delicacy of feeling - what may be called aesthetic temperament; and (2) culture of the aesthetic judgment by actual exercise and discipline. Such discipline leads to the developed taste of the connoisseur. Taste is in the aesthetic life essentially what character is in the moral life. The question whether there can be any universal standard of taste was frequently discussed. Writers of the associationist school (e.g., Jeffrey) have generally denied any real universality for such a standard, because of the multifaceted nature of the sources of beauty. Hume falls back on the consensus of cultivated opinion. Grant Allen, under biological influences, admits only such consequences as springs from similarity of nervous organization. Idealists such as Lotze ordinary defend a contrary view because of the asserted universality of beauty.

Temperance

Temperance is the virtue of moderation and self-control in anything, but especially in indulgence in pleasures. Temperance, in the large sense of moderation or self-control, was the characteristic Greek virtue. For Plato, temperance is one of the four cardinal virtues, both in the state and in the individual. He describes it as a harmony or agreement between the higher and the lower parts - the governing and the governed in the state, the rational and the appetitive in the soul resulting in the obedience of the lower to the higher. While Aristotle's specific virtue of temperance is still narrower in its range than Plato's, in his doctrine of the mean he may be said to reduce all virtue to the habit of moderation or temperance in the large sense. Christianity reaffirmed the importance of this virtue, deepening and broadening the Greek conception of it. The new emphasis given by Christianity to the negative element in temperance, through its principle "die to live" led to the exaggeration of temperance into abstinence, which is, in Aristotle's eyes, an extreme - that of defect - no less than excess.

Thales (636-546)

An Ionian, the founder of Greek philosophy and the Milesian school of cosmologists. Born at Miletus about 636 BCE., he was a contemporary of Solon and Croesus and died at the age of ninety about 546. According to popular tradition he lived mainly as one of the Seven Sages -- seven men living between 620-550 BCE. distinguished for their wisdom as rulers, lawgivers, councilors, or authors of maxims. Many tales were told of him. In one of these he is an unpractical dreamer, and falls into a well while star-gazing. In another he shows himself superior to the ordinary practical man by the use he makes of his scientific knowledge. He is said to have foreseen an abundance of olives and made a corner in oil, thus proving he could be rich if he liked. It is plain that people in general had no idea of his real work, and regarded him simply as a typical 'sage', to whose name anecdotes originally anonymous might be attached. These stories, then, tell us nothing about Thales himself, but they do bear witness to the impression produced by science and scientific men when they first appeared in a world that was half inclined to marvel and half inclined to scoff.

There is, however, another set of traditions about Thales from which something may be learnt. They are not of a popular character, since they attribute to him certain definite scientific achievements. One of the most important of these, the prediction of a solar eclipse, is reported by Herodotus (i. 74). The existence at Miletos of a continuous school of cosmologists give credit to the preservation of such traditions. We are further told on the authority of Aristotle's disciple Eudomos, who wrote the first history of mathematics, that Thales introduced geometry into Hellas. However, the evidence is incomplete since no writings by Thales were extant even in the time of Aristotle, and it is believed that he wrote nothing. In the annals of Greek philosophy he was probably the first who looked for a physical origin of the world instead of resting upon mythology. As such he is credited with being the first human being who can rightly be called a man of science.

His philosophy, if it can be called by that name, consisted of two propositions. The first is that the earth is a flat disc which floats on water. From an early date the Greeks, as was natural for them, began to think of the earth as an island surrounded by the river Okeanos. To regard it as resting on the water is a further step towards a truer view. It was something to get the earth afloat. The second is the principle of all things is water, that all comes from water, and to water all returns. This means that water is the one primal kind of existence and that everything else in the universe is merely a modification of water. In Aristotle's terminology, Thales maintained that water is the material cause of all things. It may well have seemed to Thales that water was the original thing from which fire on the one hand and earth on the other arose. Henceforth the question whether everything can be regarded as a single reality appearing in different forms is the central one of Greek science. Why did he choose water as the first principle? This question cannot be answered with certainty. Aristotle says that Thales "probably derived his opinion from observing that the nutriment of all things is moist, and that even actual heat is generated therefrom, and that animal life is sustained by water... and from the fact that the sees of all things possess a moist nature, and that water is a first principle of all things that are humid." This is likely the true explanation, but it

will be noted that even Aristotle uses the word "probably," so gives his statement merely as a conjecture. It is even more uncertain by what process water changes into other things.

Theophrastus (d. 287 BCE)

Theophrastus was a Greek philosopher of the Peripatetic school, and immediate successor of Aristotle in leadership of the Lyceum. He was a native of Eresus in Lesbos, and studied philosophy at Athens, first under Plato and afterwards under Aristotle. He became the favorite pupil of Aristotle, who named Theophrastus his successor, and bequeathed to him his library and manuscripts of his own writings. Theophrastus sustained the Aristotelian character of Lyceum. He is said to have 2,000 disciples, among them the comic poet Menander. He was esteemed by the kings Philippus, Cassander, and Ptolemy. He was tried for impiety, but acquitted by the Athenian jury. He died in 287 BCE, having presided over the Lyceum about thirty-five years. His age is sometimes put at 85, and 107 at others. He is said to have closed his life with the complaint about the short duration of human life, that it ended just when the insight into its problems was beginning.

Theosophy

The main teachings of Theosophy (Gk. theosophia, "divine wisdom"), which are at the same time religious, philosophic, and scientific, may be summed up as follows: it postulates one eternal, immutable, all-pervading principle, the root of all manifestation. From that one existence comes forth periodically the whole universe, manifesting the two aspects of spirit and matter, life and form, positive and negative, "the two poles of nature between which the universe is woven." Those two aspects are inseparably united, therefore all matter is ensouled by life while all life seeks expression through forms. All life being fundamentally one with the life of the Supreme Existence, it contains in germ all the characteristics of its source, and evolution is only the unfolding of those divine potentialities brought about by the conditions afforded in the various kingdoms of nature. The visible universe is only a small part of this field of evolution. As ether interpenetrates the densest solid, so matter, still subtler, interpenetrates ether, and these different grades of matter constitute seven distinct regions, spoken of as the seven great planes of the universe. The physical is the densest; the one next to it is called astral; still subtler than the astral plane is the mental. The four higher spiritual planes are as yet mere names to all except initiates and adepts. The materials being thus prepared, the divine life begins the evolution of consciousness, building for itself forms on the various planes, passing slowly through the elemental, mineral, vegetable, and animal kingdoms, and finally reaching self-consciousness and individualization, when it passes into the human stage.

HUMANS. People, being a part of the whole, are also evolving toward the perfect manifestation of the divine characteristics latent in them. That perfection, however, implies not only the attainment of sainthood, but also the possession of divine power and full knowledge of the universe, visible and invisible. As he needs a physical body to work with on the physical plane, so does he need bodies composed of the matter of those higher planes, in order to recognize them, and the organizing of such bodies is the task upon which men are engaged, consciously, in the more advanced members of the race, but unconsciously in the vast majority. The physical body, then, is not the only one humans use, even during this physical life. In connection with it and interpenetrating it, even as the planes of the universe interpenetrate each other, he has an astral body, by means of which he feels and desires, a mental body, by means of which he thinks. The higher four spiritual bodies are still unorganized at the present stage of evolution, save in rare instances. But the three just mentioned are already fairly developed and constitute the normal working instruments of humans. This does not mean that the astral and mental bodies are as yet organized so as to take direct cognizance of the planes to which they belong by constitution; in the majority, they work only in connection with the physical body. But some individuals have already developed the senses belonging to those higher bodies. The phenomena of clairvoyance, telepathy, prophetic dreams, etc., are merely manifestations of the activity of those finer senses. Unreliable at first, like the infant's vision, they can be developed and trained, until the subtler worlds stand as an open book before the person. This constitutes the evolution of the form, which proceeds *pari passu* with the evolution of the

consciousness, the activities of which in the subtler bodies may be termed the soul. As the soul grows in power, love, and wisdom, it needs a better form in which to manifest itself; as the form grows in perfection, it becomes a better instrument for the soul. Here again evolve side by side the two poles of the universe, life and form, spirit and matter.

REINCARNATION. This unfoldment of human powers is slow and gradual; hence the necessity of repeated incarnations, each life on earth being like a day in school. At death, a person drops his physical body, and, clothed in his subtle bodies, lives a life of purification, rest, and bliss, rich and full in proportion to his stage in evolution and the deeds of the life just ended. This is the time when he assimilates the experiences of that life, changing them into faculties. As this work is being done, he drops one after the other his worn-out astral and mental bodies, and, finally, having enjoyed all the bliss to which his achievements entitle him, he clothes himself in new bodies and returns to earth to take up the work where he had left it, each life being thus a progress on the preceding one. The fact that the person does not remember his past incarnations is no proof against their reality, for the memory of those lives is stored up in the soul and not in the brain, which belongs to the resent incarnation only and therefore cannot have kept the record of experiences it never event through. But people are so absorbed by earthly interests and ambitions that they identify themselves with the body and have no time to listen to the "still small voice" within. As soon as they turn their attention inward and know themselves as the soul, then their long past will lie unrolled before his vision, as it has done in the case of the sages of all times. But even at the present stage, that past shows itself in the accumulated faculties and powers of the person and the voice of conscience, which is but the effort of the soul to guide its lower nature along lines found by experience to be the best.

KARMA. Evolution proceeds under a law as unerring as any well-established scientific law, namely, that of *karma* or the law of cause and effect. Each action, each desire, each thought, produces its result with unfailing certainty. "As a person sows, so shall he also reap." This makes perfection possible, for knowledge is power, and when a person knows the law and works with it, he can produce any result he chooses, he becomes master of his destiny. Thought is the most potent factor in the creation of causes. Each thought affects the mental body for good or evil, and as mental faculties are the powers of the soul working in the mental body, the mentality shown in any one life is the result of repeated thinking in past lives. Hence the splendid mental apparatus of the person of genius is not a gratuitous gift, but is due to hard work in the past. Thought is also the parent of action, and its subtle vibrations, traveling through space, affect others, awakening similar thoughts in the minds attuned to the same key. Many a thought has thus urged other men to actions, good or evil, in which the thinker has his share of responsibility. As thoughts evolve the mental body, so desires evolve the astral body, and also influence others by their far-reaching vibrations. By controlling his desires, purifying them, turning them toward spiritual things, a person refines his astral body and rises above his animal instincts. Actions, speaking broadly, determine future physical surroundings; those surroundings are favorable or unfavorable, according as the person has made others happy or unhappy. Reincarnation and karma explain the apparent injustice in the world, the mental and moral differences among men, and the inequality of mental, moral, and physical conditions amid which men are placed.

Liberation. But a time will come when people, having reached the full perfection attainable in the human stage, shall need no longer these earth-experiences, and shall pass on to spheres of usefulness whose glory is beyond our conception. One of the missions of theosophy is to proclaim anew the possibility of treading the "ancient narrow path" which leads to adeptship and liberation,

when a person need not return to earth unless he choose to remain and help his less-advanced brothers. The more advanced members of humanity, a mere handful as yet, have already reached that level, and from their lodge come forth from time to time the great founders of religions, the spiritual teachers of the race. This common source explains the oneness of fundamental teachings in all religions; the form only varies, according to the needs of the times and peoples. Now, as in olden times, these Elder Brothers are willing to accept as pupils those who possess the necessary qualifications. Those qualifications are: a conviction of the impermanence of mere earthly aims, a perfect indifference to the fruit of one's own actions; perfect control of mind and conduct; tolerance; endurance; confidence in the master and himself; balance, and desire for liberation. But his motive for seeking liberation must be an intense desire to help humanity, for only when this complete forgetfulness of self is attained, can a person's powers be safely developed. So long as selfishness lurks in his heart, there is danger of his becoming a curse to the race, instead of the helper he should be. The teachings are not new; they represent a body of traditions preserved from time immemorial. Reincarnation was taught in the earliest history of India and Egypt, in Greece even before Pythagoras; it is found in the teachings of Plato, Plotinus, the Cabala , the early Christians, the Alexandrian Gnostics, Neoplatonists, Paracelsus, and Giordano Bruno. During the Middle Ages traces of it appeared in Freemasonry and among the Rosicrucians. In modern times, this wisdom-tradition was revived by Helena Petrovna Blavatsky , who had been for years the pupil of great oriental adepts or sages. Aided by Henry Steel Olcott, she founded the Theosophical Society in New York City, November 17, 1875. For the development see III., below.

The three objects of the society are: (1) to form a nucleus of the universal brotherhood of humanity, without distinction of race, creed, sex, caste, or color; (2) to encourage the study of comparative religion, philosophy, and science; (3) to investigate the unexplained laws of nature and the powers latent in people. Assent to the first of these objects is required for membership, the remaining two being optional. "The Society has no dogmas or creed, is entirely non-sectarian and includes in its membership adherents of all faiths and of none, exacting only from each member the tolerance for the beliefs of others that he would wish them to exhibit toward his own." In 1895, William Quan Judge, then vice-president of the society, led a secession movement which resulted in a separation therefrom of a large number of the American and some of the European members. The seceding body, however, soon divided into two bodies, one of which is known as the Universal Brotherhood and Theosophical Society (see III., below). The other body, known as the Theosophical Society in America, again subdivided; one division located at 244 Lenox Avenue, New York City, now publishes *The Word*, a monthly magazine, and the other division, headed by Charles Johnston, 159 Warren Street, Brooklyn, N. Y., publishes the Theosophical Quarterly. The parent society is international, with headquarters at Adyar, Madras, India. The last yearly report of its president, Mrs. Annie Besant, shows in December of 1907, a total of 655 branches all over the world, 77 of which are in America. A large literature has grown up within the society, including the regular publication of forty-seven magazines. The general secretary of the American section is Weller Van Hook, 103 State Street, Chicago, IL.

The Internet Encyclopedia of Philosophy

Time

Time has been studied by philosophers and scientists for 2,500 years, and although time is much better understood today than long ago, many mysteries remain. This article explores both what is known about time and what is controversial and unresolved. The focus is on physical time, the time that clocks measure, rather than on psychological time, a human being's perception of physical time. The article is structured so that it provides answers to the following questions about physical time:

What should a philosophical theory of time do?

Can we begin with a definition of time? Succinct definitions of time are rarely helpful unless they are backed up with a more systematic treatment of time. The definitions are either too trivial (Time is what keeps everything from happening all at once) or too vague (Time is the dimension of causality) or too circular (Time is what happens when things change over time) or simply cryptic (Time is the flow of events past the stationary I). When philosophers ask, " What is time?", they normally are also asking for a 'definition' that provides something more elaborate, for a philosophical theory designed to answer many of the philosophical questions about time.

Consider what a more systematic theory of time should do. It should reveal, among other things, whether time exists objectively, or is instead a construct of our imagination.

A theory of time should be able to say what physical science presupposes and implies about time. Does it imply the possibility of time travel, for instance? What does it imply about the relationship between time and spacetime? What is the largescale and the smallscale structure of time? In the smallscale, what is time made of? Physicists say that, locally, time is made of a linear continuum of instants, with each instant lasting for zero seconds. A philosophical theory will say whether the physicists are merely inventing this notion of time because it is useful or, instead, are discovering what time is. Being a continuum implies that between any two instants, there is another instant. No scientific experiment is so fine grained that it could detect whether this is true for instants that are extremely close together in time. If so, then on what grounds do scientists 'know' that time is a continuum?

A philosophical theory of time should describe the relationship between instants and events. Does the instant that we label as "11:01 AM" for a certain date exist independently of the events that occur then? In other words, can time exist if no event is happening? This question raises the thorny metaphysical issue of absolute vs. relational theories of time.

A theory of time should address the question of time's apparent direction. If the projectionist in the movie theater showsa film of milk being added into black coffee but runs the film backwards, we in

the audience can immediately tell that events couldn't have occurred this way. We recognize the arrow of time because we know about the one-directional processes in nature: brown coffee never unmixes into black coffee and milk. This arrow becomes less and less apparent to the viewer as the film subject gets smaller and smaller and the time interval gets shorter and shorter. Philosophers disagree about the explanation of this arrow. The arrow appears to be very basic for understanding nature, yet it is odd that there are hardly any arrows (asymmetries in time) in the most basic laws of physics that arre supposed to accurately describe the one-directional processes of nature. Philosophers also wonder what life would be like in some far off corner of the universe if the arrow of time were reversed there. Would our counterparts walk backwards up steps while remembering the future?

Another philosophical problem about time concerns the questions, "What is the present moment and why does it move into the past?" Present events seem to flow by, receding ever farther into the past. Many philosophers are suspicious of this notion of the flow of time. They doubt whether it is a property of time as opposed to being some feature of human perception. There are also suspicions about the present, the feature that is referred to by the indexical word "now." If the now is real, then why isn't there a term for it in the laws of science? On the other hand, some argue that the lack of this term reveals a limitation on what science can tell us about reality.

For a last example of a philosophical problem regarding time, some philosophers argue that the future is not real. These philosophers have a problem with the apparent implication that, if the future were real, then it would be fixed now, and we would not have the freedom to affect that future. Other philosophers disagree. A full theory of time should address not only this issue but also the previously mentioned constellation of philosophical issues about time.

Definitions of time

There are a wide variety of short answers to the question "What is time?" Plato said time is the circular motion of the heavens. Aristotle said it's not motion but the measure of motion. St. Augustine said time is nothing in reality but exists only in the mind's apprehension of that reality. Henry of Ghent and Giles of Rome both said time exists in reality as a mind-independent continuum, but is distinguished into earlier and later parts only by the mind. Kant said time is a form that the mind projects upon the external things-in-themselves. A modern definition says time is the dimension of causality. Let's explore some of these answers.

Aristotle provided an early, careful answer to the question "What is time?" when he said time is the "number of movement in respect of the before and after, and is continuous.... In respect of *size* there is no minimum; for every line is divided *ad infinitum*. Hence it is so with time." [Physics, 220a] In these passages, Aristotle argues that time is neither the circular motion of the heavens (Plato's view) nor any other motion. He believes time is something *by which* we measure motion. Time is like a line, he says; and it is continuous rather than discrete. The line he had in mind was a circle [223b], a structure that has no beginning or end point and so is endless in both directions. Saint Augustine objected to Aristotle's belief that time is circular, insisting that human experience is a one-way journey from Genesis to Judgment, regardless of any recurring patterns or cycles in nature. Thomas Aquinas agreed. In 1687, Newton captured some of this viewpoint when he

represented time by using a line rather than a circle. Aristotle argued that we cannot conceive of a first time because for any such time we could conceive of a time before that. Thomas Aquinas criticized the assumption that something doesn't exist if humans can't conceive it.

Aristotle raised the issue of whether time exists without consciousness: "Whether, if soul did not exist, time would exist or not, is a question that may fairly be asked; for if there cannot be some one to count there cannot be anything that can be counted..." [223a] He doesn't answer his own question because, he says, it depends on whether time is the conscious numbering of movement or instead is just the capability of movement's being numbered were consciousness to exist. Aristotle's distinction foreshadows the modern distinction between psychological time and physical time.

Physical time is public time. Psychological time is private time. We are referring to psychological time when we say that time passes slowly while we are waiting for the water to boil on the stove. We are referring to physical time when we speak of the time that a clock measures, or when we define speed to be the rate of change of position with respect to time. Psychological time is best understood as being consciousness of physical time. Psychological time stops when consciousness does, but physical time does not. Physical time is more basic for helping us understand our shared experiences in the world. It is more useful than psychological time for doing science. In the 11th century, the Persian philosopher Avicenna doubted the existence of physical time, arguing that time exists only in the mind due to memory and expectation, but Duns Scotus in the 13th century recognized both physical and psychological time.

In the 17th century, the English physicist Isaac Barrow rejected Aristotle's linkage between time and change, or between instants and events, by saying that time is something which exists independently of motion and which existed even before God's creation. Barrow's student, Isaac Newton, agreed. Newton added that motion (your speed, for example) is relative to the reference frame you are analyzing it from, but that there is a special reference frame in which real time (absolute time) is the measured time. Newton also argued very specifically that time and space are substances that provide an infinitely large container for all events; this container is the absolute reference frame. Gottfried Leibniz objected. He argued that time is not a substantial entity existing independently of those events. Leibniz insisted that Aristotle and Newton had overemphasized the relationship between time and duration, and underemphasized the fact that time ultimately involves **order as well. Time is an ordering of changes, the overall ordering of all non-simultaneous events. Leibniz added that this order is also a "something" as Newton had been insisting, but it is an ideal entity, not a concrete one as Newton was mistakenly supposing it to be. Trees and stars are concrete entities. Triangles, numbers, and relations are ideal entities.**

In the 18th century, Immanuel Kant said time and space are forms that the mind projects upon the external things-in-themselves. He spoke of our mind structuring our perceptions so that space always has a Euclidean geometry, and time has the structure of the infinite mathematical line. Kant's idea that time is a *form* of apprehending phenomena is probably best taken as suggesting that we have no direct perception of time but only the ability to experience things and events *in* time. Some historians distinguish perceptual space from physical space and say that Kant was right about perceptual space. It's difficult, though, to get a clear concept of perceptual space. If physical space and perceptual space are the same thing, then Kant is claiming we know a priori that physical space is Euclidean. With the discovery of non-Euclidean geometries in the 1820s, and

with increased doubt about the reliability of Kant's method of transcendental proof, the view that truths about space and time are apriori truths began to lose favor.

In 1924, Hans Reichenbach defined time order in terms of possible cause. Event A happens before event B if A could have caused B but B couldn't have caused A. This was the first causal theory of time. Its usefulness depends on a clarification of the notorious notions of causality and possibility.

One proper, but indirect, way to answer the question "What is physical time?" is to declare that it is whatever the time variable t is denoting in the best-confirmed and most fundamental theories of current physics. Many philosophers complain that this answer is incomplete because, although philosophical theories of time should be informed by what science requires of time, they should progress beyond.

What science requires of time

Quantum field theory and Einstein's general theory of relativity are the most fundamental theories of physics. According to these theories, spacetime is a collection of points called "spacetime locations" where physical events occur. Spacetime is four-dimensional and a continuum, with physical time being a distinguished, one-dimensional sub-space of this continuum. In 1908, the mathematician Hermann Minkowski had an original idea in metaphysics regarding space and time. He was the first person to realize that spacetime is more fundamental than time or than space. As he put it, "Henceforth space by itself, and time by itself, are doomed to fade away into mere shadows, and only a kind of union of the two will preserve an independent reality." The metaphysical assumption behind Minkowski's remark is that what is independently real is what does not vary from one reference frame to another. It's their "union," what we now call "spacetime," that doesn't vary.

Newton would have disagreed. He declared that every observer can in principle determine time intervals that depend in no way on the observer's frame of reference. If the time interval between two lightning flashes is 100 seconds on someone's clock, then the interval also is 100 seconds on your clock, even if you are flying by at an incredible speed. Albert Einstein rejected this piece of common sense in his 1905 special theory of relativity when he declared that the time interval (and the distance) between two events depends on the observer's reference frame. As Einstein expressed it, "Every reference-body has its own particular time; unless we are told the reference-body to which the statement of time refers, there is no meaning in a statement of the time of an event." Each reference frame (or reference body) divides spacetime differently into its time part and its space part.

For example, suppose a bolt of lightning strikes the front of a speeding train and another strikes the back of the train. The train conductor, who is sitting in the middle of the train, tries to determine whether the two lightning bolts struck simultaneously. If the two flashes from front and back reach the conductor at the same instant, they did. According to Einstein's definition of simultaneity for two events occuring at different places, light rays coming from those two events will reach the midpoint between them at the same time. The train conductor is at the midpoint of the train. You, however, are at rest on the platform beside the train track just as the two flashes reach the conductor. They reach you at the same instant as well, but you will judge that neither you nor the conductor are at the midpoint between the two events; you are merely at the midpoint of the train. From your perspective (reference frame), you will point out that the conductor is

speeding toward the place where the front lightning bolt struck. By the time the light reaches him (and you), he is closer to the front strike, so the lightning must have struck the back of the train before it struck the front. You will judge that the two events were not simultaneous. Einstein says both of you are correct in your apparently contradictory judgments about simultaneity. This feature of our universe is what Einstein calls the "relativity of simultaneity." The events really are simultaneous in the reference frame fixed to the train, and the events really are not simultaneous in the reference frame fixed to the track. This relativity is a relativity for distant events, not for events happening at the same place.

Science assigns numbers to times because, in any reference frame, the happens-before order-relation on events is faithfully reflected in the less-than order relation on the time numbers (dates) that we assign to events. In the fundamental theories, the values of the time variable t are real numbers, with each number designating an instant of time. Time is a linear continuum of instants, similar to the mathematician's line segment. Therefore, physical time is one-dimensional rather than two-dimensional, and continuous rather than discrete. One can't be sure from this that time is linear rather than circular because a segment of a circle is also a linear continuum. If it were circular, then Homer might write his Iliad and Odyssey epics in the future, a possibility that appealed to the ancient Stoic philosophers. The logic of the term "time" doesn't rule out a nonlinear structure, but there is no reason to believe it occurs.

Regarding the instants, time's being a linear continuum implies there is a nondenumerable infinity of them. It also implies they are so densely packed that between any two there is a third, and yet no instant has a next instant. There is little doubt that the actual temporal structure of events can be embedded in the real numbers, but how about the converse? That is, to what extent is it known that the real numbers can be adequately embedded into the structure of the instants? The problem is that, although time is not quantized in quantum theory, for times shorter than about 10 to the minus 43 seconds, the so-called Planck time, science has no experimental support for the claim that between any two events there is a third. The support comes from the fact that the assumption of continuity in the general theory of relativity and in quantum theory is convenient and useful, and it rests on the fact that there are no better theories available. Because of quantum mechanical considerations, physicists agree that the general theory of relativity must fail for durations shorter than the Planck time, but they don't know just how it fails. That is, there is no agreement among physicists as to whether the continuum feature of time will be adopted in the future theory of quantum gravity that will be created to take account of both gravitational and quantum phenomena.

In 1922, the Russian physicist Alexander Friedmann predicted from general relativity that the universe should be expanding. In 1929, the American astronomer Edwin Hubble made careful observations of clusters of galaxies and confirmed that the universe actually is undergoing a universal expansion. Each galaxy cluster is moving away from most every other. So, at any earlier moment the universe was more compact. Projecting to earlier and earlier times, and assuming that gravitation is the main force at work here, the astronomers now conclude that about twelve to fifteen billion years ago the universe was in a state of infinite density and zero size. Because all substances cool when they expand, physicists believe the universe itself must have been cooling down over the last twelve to fifteen billion years. Therefore, the universe started out very hot and very small. This beginning process is called the "big bang." As far as we know, the entire universe

was created in the big bang, and time itself come into existence 'at that time'.

In the literature in both physics and philosophy, descriptions of the big bang often assume that a first event is also a first instant of time and that spacetime did not exist outside the big bang. This intimate linking of a first event with a first time is a philosophical move, not something demanded by the science. It is not even clear that it's correct to call the big bang an event. The big bang event is a singularity without space coordinates, but events normally must have space coordinates. One response to this problem is to alter the definition of "event" to allow the big bang to be an event. Another response, from James Hartle and Stephen Hawking, is to consider the past cosmic time-interval to be open or unbounded at t=0 rather than closed or bounded by t=0. Looking back to the big bang is then like following the positive real numbers back to ever smaller numbers without ever reaching a smallest positive one. If Hartle and Hawking are correct that time is actually like this, then the universe had no beginning event, but it has a finite past, and the term "the big bang" refers to the very early events, not to a single event. The remainder of this article we will speak casually of 'the' big bang event in order to simplify the discussion.

There are serious difficulties in defending the big bang theory's implications about the universe's beginning. They are based on the assumption that the universal expansion of clusters of galaxies can be projected *all* the way back. Yet physicists agree that the projection must fail in the Planck era, that is, for all times less than 10 to the minus 43 seconds after 'the' big bang. Therefore, current science cannot speak with confidence about the nature of time in the Planck era, nor whether time existed before that era. If a theory of quantum gravity does get confirmed, it should provide information about the Planck era, and it may even allow physicists to answer the question, "What caused the big bang?" However, at present, the best answer is probably "Nothing; it just happened." The philosophically radical, but theologically popular, answer, "God caused the big bang, but He, himself, does not exist *in* time" is cryptic because it is not based on a well-justified and detailed theory of who God is, how He caused the big bang, and how He can exist but not be *in* time. It is also difficult to understand St. Augustine's remark that "time itself was made by God." On the other hand, for a person of faith, belief in God as creator is usually stronger than belief in any scientific hypothesis or in any epistemological demand for a scientific justification or in any philosopher's demand for clarification.

The big bang theory is accepted by the vast majority of astronomers, but it is not as firmly accepted as is the theory of relativity. Relativity theory challenges a great many of our intuitive beliefs about time. The theory is inconsistent with the common belief that the order in which two events occur is independent of the observer's point of view. For events occurring at the same place, the order is absolute (independent of the frame), but for distant events occurring close enough in time to be in each other's absolute elsewhere, event A can occur before event B in one reference frame, but after B in another frame, and simultaneous with B in yet another frame.

Relativity theory implies there is time dilation between one frame and another. For example, the faster a clock moves, the slower it runs, relative to stationary clocks. Time dilation shows itself when a speeding twin returns to find that his (or her) Earth-bound twin has aged more rapidly. This surprising dilation result has caused some philosophers to question the consistency of relativity theory, arguing that, if motion is relative, then from the perspective of the speeding twin, *he* should be the one who aged more rapidly. This argument is called the "twins paradox." Experts now are agreed that the mistake is within the argument for the paradox, not within relativity

theory. The argument fails to notice the radically different relationships that each twin has to the rest of the universe as a whole. These relationships call for treating the twins paradox with general relativity, not with special relativity.

There are two kinds of time dilation. Special relativity's time dilation involves speed; general relativity's involves acceleration and gravitational fields. Two ideally synchronized clocks need not stay in synchrony if they undergo different accelerations or different gravitational forces. This effect would be especially apparent if one of the two clocks were to fall into a black hole. A black hole can form when a star exhausts its nuclear fuel and contracts so compactly that the gravitational force prevents anything from escaping the hole, even light itself. The envelope of no return surrounding the black hole is its event horizon. As a clock falls in the direction of a black hole, time slows on approach to the event horizon, and it completely stops at the center of the hole--relative to time on a clock that remains safely back on Earth. As an astronaut swiftly falls into the hole, the proper time, the time measured on the astronaut's clock, passes beyond the end of our civilization's time.

The supplement to this article continues with the topic of what science requires of time, and it provides background information about other topics discussed in this article.

Time travel

Remembering an earlier episode in your life is a kind of mental time travel, but philosophers have generally been more interested in travel in physical time than in psychological time. This discussion will begin with a short list of the possibilities, then discuss some of them in greater detail afterwards. (a) Einstein showed that travel forward in physical time is possible relative to the time of those who move more slowly than you. With this kind of relativistic time travel, you can't return to the old present, but you can be present at the birth of your great grandchildren. (b) Travel backward in physical time is possible only if nothing that has happened gets changed; for example, you can't go back in time and prevent your parents from having any children. (c) If the history books were to tell of someone named Booth who seemed to pop into existence in the 1860s and who then assassinated Abraham Lincoln, then you or someone else will someday build a time machine to go back and become this Booth character. Suppose you are that person. Then, since Booth died back in the 1860s, you'd have died before you were born. (d) If you fell into a black hole, then you'd travel to a time after the end of the unverse, as measured in a reference frame tied to Earth. (e) If you get on a plane on the Earth's surface and travel west, you will cross a time zone and instantly go back an hour, but all you've done is changed your reference frame, so this is a trivial form of travel in physical time. (f) If your body were quick-frozen in the year 2,020 and thawed in 2,088, then you would travel forward 68 years in clock time but only a few seconds of your biological time. This is a case of biological time travel, not a case of physical time travel.

If you have a fast enough spaceship, you can travel to the year 4,500 A.D. according to someone else's stationary clock back on Earth. This is a direct consequence of the time dilation described in the theory of relativity. You can travel to *someone else's* future, not your own. You're always in your own present. Unfortunately, once you go to 4,500 A.D. (in the frame of reference in which the Earth is stationary), you are stuck in the Earth's future. You can not reverse course in your spaceship and return to the time you began. In other words, if you do leave Earth now and fly very

fast, then land back on Earth in 4,500 A.D., you must live with the consequence that all your friends have died centuries ago. On this trip to 4,500 A.D., how much time would elapse on your own clock? The answer depends on how fast your spaceship goes, what accelerations occur, and whether gravitational forces are acting. The faster your spaceship goes, the less time it will take--actually take, not just appear to take. As you approach infinitesimally close to the speed of light, the trip to 4,500 A.D. will take essentially no time at all for you, and you'll just 'pop' into the future of Earth. That's from your own perspective; observers who remained stationary on Earth will have observed your escapades for thousands of years.

Unlike the time travel in science fiction movies, relativistic time travel to the future is continuous, not abrupt. That is, as you travel to the future, you exist at all intervening times according to the stationary Earth clock. You don't 'poof' into existence in 4,500 A.D.; you existed during their year 4,499, but your spaceship hadn't yet landed. In science fiction movies, which almost always depict nonrelativistic time travel, time travelers suddenly appear from out of the past, and other travelers suddenly disappear from now and pop into the future. These phenomena have never been observed, despite the parapsychological literature, but if they were reliably observed, then we would consider the hypothesis that space has an extra dimension allowing time travel. The 'poofs' in ordinary 4-d spacetime could actually be motions along a continuous trajectory in 5-d spacetime. One would wonder, though, how anyone could ever verify (check) that the time traveler took one trajectory in the higher dimension rather than another.

There are two kinds of travel to the past: going back and changing the past, and going back and not changing it. Going back and murdering your infant self is impossible. Logic is more basic than physics. Going back to the past but not changing the past is probably possible, but there are significant difficulties yet to be overcome before we can be sure. In recent decades, mathematicians and theoretical physicists have described time machines, or at least universes containing backward time travel, that are consistent with Einstein's equations of general relativity. Stephen Hawking believes all these time machines are ruled out by the laws of general relativity. General relativity theory is so complex that it isn't always clear, even to the experts, what is and isn't allowed by the theory.

Going back and punching yourself in the nose even though you remember never having been punched may be possible, provided you have a faulty memory and provided we can make sense of the integrity of your personal identity, your being the same person through it all. If you travel back before your birth, you could die before you are born. Also, when you travel back you will remember some of the future. That is, you will remember some of what *we* call the future, though not what we think of as the past. Thus this sort of time travel requires a radical revision in our conceptions of memory and personal identity.

If a person travels back in time, the event of climbing into the time machine causes the person to appear back in history. The person's world line will be a closed loop, which implies backward causation. Some philosophers believe backward causation can be ruled out by the definition of "cause," just as they can rule out there being a week next year in which Monday is the day immediately after Friday. Many other philosophers disagree on the grounds that backward causation is improbable or nonexistent, but not impossible.

Optimists about time travel to the past face other obstacles. Where are all the time travelers now?

Why aren't they here visiting us on their vacations? There should be some evidence that we've been visited by now, unless of course time machines just never get built. Probing the possibility of a contradiction, John Earman has described a rocket ship that carries a very special time machine. The time machine is capable of firing a probe into the past. Suppose the ship is programmed to fire the probe on a certain date unless a safety switch is on. Suppose the safety switch is programmed to be turned on if and only if the 'return' of the probe is detected by a sensing device on the ship. Does the probe get launched? The way out of Earman's paradox seems to require us to accept that (a) the universe conspires to keep people from building the probe or the safety switch or the sensing device, or (b) time travel probes must go so far back in time that they never make it back to the time when they were launched, or (c) past time travel is impossible.

Feynman diagrams in particle physics have been described by Richard Feynman himself as illustrating how a particle's moving forward in time is actually its antiparticle moving backward in time. However, physicists don't take Feynman's suggestion literally. As a leading particle theorist, Chris Quigg of Fermi National Accelerator Laboratory, explained in 1998, "It's not that antiparticles in my laboratory are actually moving backward in time. What's really meant by that is that if I think of a particle moving from one place to another forward in time, the physical process is the same as it would be if we imagine running the film backward and also changing the particle into an antiparticle."

Relational theories of time

When you set your alarm clock for 7:00, does the time of 7:00 cause your alarm to go off? No, although it wouldn't go off if it weren't 7:00, under the circumstances. Such is the nature of causality. It is generally agreed that time causes nothing. Another question, underlying the question about your alarm clock, is whether 7:00 exists despite what happens. Absolute and relational theories of spacetime offer opposing answers to the question of whether time exists independently of the spacetime relations exhibited by physical events. Absolute theories say it does; relational theories say it does not. The absolute theories describe spacetime as being like a container for events. The term "absolute" in this context does not mean independent of the observer, but independent of the events. The absolute theories imply that spacetime could exist even if there were no material objects in the universe, but relational theories imply that spacetime is nothing but material objects, their events, and the spatiotemporal relationships among them. Everyone agrees time cannot be *measured* without there being changes, but the present issue is whether it can *exist* without changes.

Aristotle took a position regarding the relationship between time and change when he remarked that, "neither does time exist without change [218b]." However, the battle lines were most clearly drawn in the 17th century when Leibniz explicitly said there is no time without actual change and Newton protested that time exists regardless of whether anything changes. They offered several arguments for their positions. Huygens, Berkeley, and Mach entered the arena on the side of Leibniz. In the 20th century, Reichenbach and the early Einstein declared the special theory of relativity to be a victory for the relational theory, but they may have been overstating the amount of metaphysics that can be extracted from the physics. Newton's own absolute theory of space used the notion of a space filling material aether at rest in absolute space with distances and times being independent of reference frames, and this is unacceptable, but other absolute theories are

consistent with current science.

Absolute theories were dominant in the 18th and 19th centuries, and the relational theories were dominant in most of the 20th century, but at the end of the century, absolute theories have gained some ground and there is no convergence of opinion on this prominent issue.

Absolute theories are called "substantival" or "substantial" if they require spacetime to be a substance. These are the kind of absolute theories discussed here. Absolutists disagree among themselves about what it means to be a substance. It does not mean that spacetime is a kind of stuff out of which physical events are composed. Absolutists have described spacetime as "an antecedent arena for events" and "ontologically prior to events" and "an irreducible object of predication" and "the substrata for properties" and "the domain of the intended models of the basic physical theories." The container metaphor may work for special relativity, but general relativity requires that the curvature of spacetime be affected by the distribution of matter, so today it is no longer plausible for an absolutist to assert that the 'container' is independent of what it contains.

To Newton, the time variable t in the laws of physics ranges over real numbers that label absolute instants. To Leibniz, t ranges over real numbers that are used to express relationships among events. What is implied by saying time is a relationship among events? For example, if events occur in a room a second before and after 11:01 AM, but not at that instant, must the relationist say there never was a time of 11:01 AM in the room? No. The relationist will say 11:01 exists, though not as an absolute instant. 11:01 exists because the whole system of instants exists as a means of expressing the facts about events. It exists because the universe's events have the order they do, the order of an interval of the real numbers. Something somewhere must be happening at 11:01 or else we were mistaken in assigning the order of the real numbers to events. There can be no 'empty' time, the relationist says. Will this relationist strategy for time work also for space? Can there be no empty space? No merely possible places? That is a bigger philosophical problem. We need to speak of an electron's taking a different path from the one it actually took. Is there a coherent role for these nonexistent events in the relationist's 'relationships among events'? This question needs to be answered in order to properly assess a standard problem for the relational theory, a problem raised by Newton. He argued that if one reference frame is stationary in absolute space while the other is moving at a constant velocity, then, we cannot tell which one is really moving; we can detect only the relative motion; but if one is accelerating and the other is stationary in absolute space, then we can detect which is which. We can tell whether our spaceship is accelerating forward in absolute space by whether we are pushed back into our seats. Absolutists have argued that this difference in what we feel is not properly explainable by a relational theory of space, but only by absolute accelerations. Relationists have counterattacked by asking how acceleration relative to an absolute space has anything to do with feeling pushed back in our seats. Translating this debate into the idiom of relativity theory, the Newtonians are saying that their absolute theory is required to explain curved world lines. The relationists' counterattack is asking how curvature of the world line is to be explained by appeal to absolute spacetime. The absolute theorists have an answer. Are there two points on the world line such that along some alternative world line that also connects the points the spacetime interval would have been shorter? If so, the world line is curving in absolute spacetime independently of the observer's reference frame. That's how the existence of absolute space enables us to tell who is really accelerating and who is not. Notice that this answer requires the notion of alternative, possible, but not actual, world lines. The absolute theory can

supply these because it takes all spacetime points as being substantial. The relational theory cannot do this, absolutists argue. At least it cannot if it appeals only to actual physical events, actual world lines composed of these events, and actual spacetime relations that hold among them. If the relational theory were to take spacetime points more seriously and consider them to be permanent possibilities of the location of events, then the relationist could use a very similar strategy to explain the feeling of being pushed back in our seats (namely that the feeling is due to curvature of the world line), but then the theory would collapse into substantivalism, and there would no longer be a difference between the two theories, John Earman has argued. To the absolutist, a spacetime point is a place where something *could* happen. The relational theory must use only actual events, not possible events, Earman argues. The relationists Leibniz and Russell would agree. Lawrence Sklar disagrees. He says that if relationists are going to talk about locations between material objects where no objects exist, then they "had better allow talk about possible objects and their possible spatial relations" because "versions of relationism that eschew such notions are pretty implausible...." The same point applies to possible events.

One of Leibniz's arguments against Newton's absolute time is still used today. If the entire universe were shifted five minutes in absolute time, no one would be the wiser. This pair of observationally indistinguishable states of affairs is metaphysically distasteful to anyone who subscribes to Leibniz's Principle of the Identity of Indiscernibles. The principle says that if no one could observe a difference between the two, then they are really just one. So, absolute theories are incorrect because they imply that the time shift makes a difference. Some absolutists would turn Leibniz's argument on its head. Rejecting Leibniz's Principle, these absolutists ask us to consider the possibility that everything has stopped happening for five minutes or, instead, stopped for ten minutes. Because we can imagine this difference, it's a real physical possibility, and the relational theory of time is refuted because it implies that the different freezings of time are not real physical possibilities.

Hartry Field argues for the absolute theory by pointing out that modern physics requires gravitational and electromagnetic fields that cover spacetime. They are states of spacetime. These fields cannot be states of some Newtonian aether, but there must be something to have the field properties. What else except substantive spacetime points?

The flow of time

"It is as if we were floating on a river, carried by the current past the manifold of events which is spread out timelessly on the bank," said Plato. Other writers describe the passage of time as the "moving now" that cleaves the past from the future. "The passage of time...is the very essence of the concept," said Gerald Whitrow, and philosophers are eager to expose the real story behind the metaphor. It is universally agreed that time doesn't pass by at a rate of one second per second. Some philosophers have argued that the passage of time is a feature of the world to be explained by noting how events change. An event such as the death of Queen Anne can change from having the property of being future (to one of her contemporaries), to having the property of being present, to having the property of being past. Agreeing that events can change their properties in this manner, J. M. E. McTaggart argued that the concept of time's flow is absurd because it is contradictory for Queen Anne's death to be both present *and* past. Many other philosophers believe events do not change any of their properties. An event's 'changing' from being future to being present to being

past is not a real change in its properties, but only in its relations to the observer. So, it is concluded that the notion of time's flow is a myth. The question of why the flowing conception of time is such a compelling myth is answered by Ludwig Wittgenstein who asks us to be more attentive to the proper use of our words so we don't consider time to be a process:

> **In our failure to understand the use of a word, we take it as the expression of a queer *process*. (As we think of time as a queer medium, of the mind as a queer kind of being.)**

On yet another analysis, the notion of time's flow is a subjective feature of psychological time to be explained by a person's having more memories and more information at later times.

The arrow of time

Unlike space, physical time seems to be inherently directional. Let's consider what this means. Time is directed from the past toward the future, and it cannot reverse direction; this is implied by the very definition of the terms "past" and "future." Consequently, to say "Time flows in one direction only, from past to future" is to express a tautology. However, time's arrow is *another* sort of directedness. It is what distinguishes events ordered by the happens-before relation from those ordered by its converse, the happens-after relation. Time's arrow is the sort of temporal asymmetry you notice when you light a fire cracker. You get a loud sound, along with heat, light and ashes. It's practically impossible to reverse the process and create an unlit firecracker from the combustion products. Similarly, if you pour hot water into cold water, you get lukewarm water, but you never notice lukewarm water unmixing into a cold part and a hot part . Such is the way irreversible processes go. The arrow of an irreversible physical process is the way it normally goes, the way it normally unfolds through time--time in the present epoch of the universe's history. The amalgamation of all the universe's irreversible processes produces time's arrow, the 'cosmic' arrow of time. The goals of a theory of time's arrow are to understand why this arrow exists, if it does, and to explain its connection to other temporally asymmetric phenomena such as causes preceding their effects and our knowing the past but never the future. Physicists often speak of multiple "arrows of time." These are processes that are noteworthy in their temporal asymmetry. For a process to be classified as such an arrow of time, it must work either differently or not at all if time were reversed.

Although no one doubts that psychological time has an arrow, philosophers of science are not all convinced that physical time has an arrow. Henryk Mehlberg said [in 1961], "On presently available scientific evidence, time should be considered as having no arrow or unique direction, and as involving no intrinsic (observer-independent) distinction between past and future." If this analysis is correct, then the so-called cosmic arrow of time is really the arrow of the world in time and not of time itself. There is no point in assigning a direction to *absolute* time since its direction is presumably unaffected by the direction or flow of any physical processes.

If physical processes in time do have an arrow, and if the processes obey scientific laws, and if these laws are to be accounted for by the basic laws of physics, then you might think that an inspection of these basic laws would readily reveal time's arrow. It won't. Nearly all the basic laws are time symmetric. This means that if the variable t is replaced by its negative -t in those laws, the result is still a law; the basic equations are unchanged. To illustrate, if you have a movie of a basic physical process, say two protons bouncing off each other, you can run it forwards or backwards and

neither showing will look odd. And both ways of running the movie describe a world consistent with the laws of physics. On the other hand, if you have a movie of ordinary, macroscopic phenomena, say a ping pong ball bouncing along a wooden floor, you have no trouble telling which way is the right way to show the movie. This difference between basic movies and ordinary movies is odd because ordinary phenomena are supposed to be composed of more basic phenomena. Some scientists and philosophers respond to the curious fact that nearly all the basic laws are time symmetric by suggesting that we must not yet have found the true laws (or invented the best laws) underlying nature's behavior; we need to keep looking for more basic, time asymmetrical laws in order to account for time's arrow. In 1947, physicists discovered one elementary phenomenon that is not time symmetric, the decay of a special kind of meson called the "kaon." It takes more than a trillion times longer for a kaon to decay into pions than for a kaon to be produced by motion reversal from those decay products. Unfortunately, most physicists don't believe that kaon decay alone could account for time's arrow. For example, what does kaon decay have to do with a whole container of lukewarm water never unmixing into cold and hot halves?

Ludwig Boltzmann was the first to show how an irreversible macroscopic phenomenon may arise from reversible microscopic laws. He showed that macroscopic thermodynamic processes such as heat flow in a gas are irreversible because the probability of their actually reversing is insignificant. There are more lukewarm microstates of the set of its constituent molecules than there are microstates with hot and cold regions, so the system evolves in the 'direction' of what is most probable. Let A be the set of microstates of an isolated container in which one part of the container contains hot gas and a separate part contains cold gas. Let B be the lukewarm microstates. Assume all the microstates are equally probable. The number of B states is dramatically larger than the number of A states, so the probability that one of the A states will lead to one of the B states is almost one whereas the probability that a B state will lead to an A state is almost zero. That is why the process of heat flow in a gas is irreversible, said Boltzmann. The law of physics describing these processes is the second law of thermodynamics, an irreversible law that doesn't hold at the micro-level. The second law says that a change occurring in an isolated, macroscopic system will most probably not lead it into a state of lower entropy. Entropy is approximately a measure of a system's disorder. Isolated systems change toward disorder because disorder is so probable; there are so many more disordered states than ordered ones. So, entropy's relentless increase accounts for the irreversibility of thermodynamic processes.

Creationist opponents of the theory of evolution often point out that the growth of a baby into an adult is an example of a thermodynamic process in which entropy decreases rather than increases, showing that life is a process that violates the laws of science accepted by evolutionists. Actually the process is consistent with the second law because the growth process doesn't occur in an isolated system. Instead, food, light, air and water enter the system at the expense of entropy elsewhere in the universe. So, creationists are misusing the second law of thermodynamics as they search for arguments to use against the theory of evolution.

The second law, as usually stated, does have exceptions. It holds only for isolated macro-processes that are short-lived compared to the period of Poincaré cycles. Henri Poincaré's recurrence theorem in statistical mechanics says every isolated system will eventually return to its original state. It follows that eventually every irreversible process must reverse. Therefore, it is not strictly correct to say the higher of two entropy states in an isolated system is the later of the two. In practice, though, these periods are absurdly long, even compared to the history of the universe.

Penrose has raised a problem for those who believe that the cosmic arrow of time is due to entropy increase. Big bang theorists assume that the universe began in a state of thermodynamic equilibrium, and from this they make their calculations about how the universe could have evolved to the state we find it in today. Yet thermodynamic equilibrium is a state of *maximum* entropy, so the big bang theory contradicts the second law of thermodynamics. Penrose says the way out of this problem is for the new theory of quantum gravity to violate time symmetry and to explicitly include an arrow of time. Stephen Hawking disagrees on the grounds that symmetries are so useful they should be given up only as a last resort after trying other revisions.

If the arrow of time is to be explained by entropy increase, then we want to know why entropy increases. Why do we live in a world in which the total entropy of an isolated system cannot decrease, except after astronomically long times (the Poincaré times)? Many physicists claim that if the universe had started out differently, entropy decreases could be much more likely than entropy increases. If so, entropy increase is not the deep reason behind time's arrow. Instead, the arrow of time depends on the world having started with the initial configuration that it had, especially on its having had an initial, rapid expansion. This leads naturally to the request for an explanation of the initial configuration of our universe, yet cosmologists cannot provide one.

The direction of increasing entropy may be only one of time's arrows, the 'thermodynamic arrow.' Additional arrows might be caused by the following processes:

a. It is easier to know the past than to know the future.

b. Electromagnetic waves spread out from, and never converge into, a point.

c. Quantum mechanical measurement collapses the wave function.

d. Kaon decay is different in a time reversed world.

e. We see black holes but never white holes.

f. The universe expands, but doesn't contract.

g. Explanation uses the past information, not the future.

h. Causes precede their effects.

i. Higgs boson decay is different in a time reversed world.

Many physicists suspect all these arrows are linked and that they might somehow be explained in terms of the initial conditions at the time of the big bang. Most of these physicists believe that arrow i is the most fundamental here; the temporal asymmetry of the Higgs boson particle is the reason why the universe contains what little matter it now does after all the primordial world's antimatter collided with its matter. However, if the arrows are *not* all linked, then some may reverse while others do not. For example, if the universe expands to a maximum volume and then reverses and begins to collapse in a big crunch, arrow f above has reversed, but other arrows have not. The question of whether the arrows are or are not linked is one to be settled by the physicists, not the philosophers.

If scientists can explain why the world's irreversible processes are not normally observed to reverse, if they can do this without time-asymmetric laws of nature, and if they don't need to postulate an intrinsic difference between the past and future directions, then perhaps time itself has no arrow. This would not be to say the arrow is somehow unreal, but merely that it is contingent on which processes exist and isn't a necessary characteristic of time itself. Paul Horwich made this point, and offered an analogy. Most people are right-handed, but we don't conclude from this that the universe itself is right-handed or that space has an arrow. By analogy, if the universe's processes have an arrow, let's not conclude that time itself has that arrow.

Temporal indexicals and essentially tensed facts

Can everything sayable using tensed verbs also be said using tenseless ones? Reichenbach argued that the past tense fact "Custer died in Montana" could equally, though inelegantly, be expressed by the logically-tenseless sentence, "There is a time t such that Custer dies at t, and t is less than n, the time of utterance of this sentence." The number n is the present time, and its value can be selected by the analyst of the sentence. The past tense has disappeared, and the present tense verbs in the sentence are logically tenseless because they contain no essential reference to the present. In other words, tenses can be paraphrased away using tenseless language. Not so, say Roderick Chisholm and A. N. Prior, who claim that some facts are essentially tensed. For example, the "is" in the sentence "It's now midnight" is essentially present tensed because there is no equivalent sentence using tenseless verbs. Analyzing it as "There is a time n such that n=midnight" with the analyst choosing the value of n is to miss the essential reference to the present in the original sentence. Chisholm and Prior say that true sentences using the temporal indexical terms "now," "before now," and "happened yesterday" are part of the facts that science should account for, but that science fails to do this because it restricts itself to a Minkowski-like spacetime representation of events. A Minkowski spacetime diagram displays what happens before what, but not which time is present time. What is missing from the diagram is some moving point on the time axis representing the observer's "now." In the same spirit, Michael Dummett argues that you can have a complete description of a set of objects in space even if you haven't said which objects are near and which are far, but you cannot have a complete description of those objects without specifying which events are present and which are not.

Russell, Quine, Grünbaum, and Horwich object to assigning special ontological status to the present. According to Quine, logicians dealing with time and philosophical analysts of language dealing with talk involving tense should in principle be able to eliminate the temporal indexical words because their removal is needed for fixed truth and falsity of our sentences, and having fixed truth values is crucial for the logical system used to clarify science. "To formulate logical laws in such a way as not to depend thus upon the assumption of fixed truth and falsity would be decidedly awkward and complicated, and wholly unrewarding," says Quine. If attention is paid to how we normally use the term "fact," then the sentence "Event E is happening now (in reference frame R)" doesn't really express a fact. According to those who oppose assigning special ontological status to the present, facts must hold *simpliciter*, not relative to an observer's experience. Sentences expressing facts must have a fixed truth. The sentence "Custer's death in Montana happened a long time ago" isn't a fact because it's true for us but not for Custer's contemporaries. Unless there's a good reason to change what we mean by the very word "fact," the sentences "Event F is

past" and "It's now midnight" are not on the list of facts of the world. What are on the list are the sentences "Custer's death in Montana happened before Hitler's death in Berlin" and "Event E occurs before the event F in reference frame R." These sentences are fixed truths or eternal truths. Grammatically, the two verbs "happened" and "occurs" in the two sentences are past tense and present tense, respectively, but logically they occur tenselessly.

The determinate reality of the future

Are predictions true or false when uttered? Suppose someone yesterday said, "Tomorrow there will be a sea battle." If you, the admiral, choose to start a sea battle today, you will make the sentence be true. Many philosophers argue that in this case the sentence was true all along. Truth is eternal or fixed, they say, and "is true" is a tenseless predicate. The ancient Greek philosopher Chrysippus was convinced that a contingent sentence about the future is either true or it is false and not any value in between. Many others, following Aristotle's lead, argue that the sentence (that is, the proposition or statement made using the sentence) isn't true until the time at which the sea battle occurs. The sentence wasn't true yesterday. In other words, predictions have no truth values at the time they are uttered. A principal motivation for adopting the Aristotelian position is the belief that if future statements involving human actions are now true, then humans are determined to perform those actions and so humans have no free will. To defend free will, we must deny truth values to predictions. The first person to give a clear presentation of the implications of treating predictions as being neither true nor false was the Polish logician Jan Lukasiewicz in 1920. To carry out Aristotle's suggestions, he developed a three-valued symbolic logic, with all grammatical sentences having the truth-values of true, false, or else indeterminate. Contingent sentences about the future, such as predictions, are assigned the indeterminate truth-value.

The Aristotelian argument against predictions being true or false has been discussed as much as any in the history of philosophy, but it faces a series of challenges. If there really is no free will, or if free will is compatible with determinism, then the motivation to deny truth values to predictions is undermined. A second challenge complains that the Aristotelian position makes the future be presently unreal. There is no determinate reality to the future if statements about the future have no truth values. This lack of determinate reality is unacceptable because special relativity implies that some events in one person's present can be in another person's future, if the two persons are in relative motion. Surely Aristotelians are mistaken if they suppose some persons' presents are real and other persons' presents are not, argued Hilary Putnam. Putnam believes future things are real, even if they do not exist yet; and the real things are all those that will exist, do exist, or have existed. Putnam disagrees with Duns Scotus who argued that only the present is real and with Aristotle who argued that only the present and past are real. Agreeing with Putnam, Quine adds a moral argument. The determinate reality of the future is assumed in moral discussions about the interests of people who are as yet unborn. If we have an obligation to conserve the environment for these people, then we are treating them as being as real as the people around us now. Yet another challenge to the Aristotelian position comes from Quine and others who claim that it wreaks havoc with the logical system we use to reason and argue with such predictions. For example, here is a deductively valid argument:

> **We've learned there will be a sea battle tomorrow.**
>
> **If there will be a sea battle tomorrow, then the admiral should be awakened.**

So, the admiral should be awakened.

Without the sentences in this argument being true or false we cannot properly assess the argument using the standards of deductive validity and invalidity, despite the work by Lukasiewicz. Yet the Aristotelian position says these sentences aren't true or false. In light of these various challenges to the Aristotelian position, many philosophers conclude that Aristotle should revise his belief that predictions fail to be true or false at the time they are uttered.

The symbolic logic of time

In the 1950s, A. N. Prior created a new symbolic logic to describe our use of time words such as "now", "happens before", "afterwards", "next", "always", "sometimes", and so forth. He was the first to appreciate the similarity in structure between time concepts and modal concepts such as "it is possible." He applied a logic having infinitely many truth-values to create a "tense logic" in which the relationships that propositions have to the past, present, and future help to determine their truth-value. In classical logic, there are only two truth-values, namely true and false. Dummett and Lemmon also made major, early contributions to tense logic. In one standard system of the logic of past time, the S4.3 system, the usual modal operator "it is possible that" is re-interpreted to mean "at some past time it was the case that." Let the letter "M" represent this operator, and add to the axioms of classical propositional logic the modal axiom M(p v q) iff Mp v Mq. The axiom says that for any two propositions p and q, at some past time it was the case that p or q if and only if either at some past time it was the case that p or at some past time it was the case that q. S4.3's key axiom is the equivalence

Mp & Mq iff M(p & q) v M(p & Mq) v M(q & Mp).
This axiom captures our ordinary conception of time as a linear succession of states of the world. Logicians disagree about what additional axioms and revisions are needed to make more of our beliefs about time be theorems of a symbolic logic of time.

SUPPLEMENT

This supplement answers a series of questions designed to reveal more about what science requires of physical time, and to provide background information about other topics discussed in this article.

- **What is a reference frame?**
- **What is spacetime?**
- **What is an event?**
- **Does the theory of relativity imply time is partly space?**
- **Is time the fourth dimension?**
- **Is time infinite?**

What is a reference frame?

A reference frame is a point of view, a perspective for making observations and judgments. Special relativity is intended to apply only to inertial reference frames. Inertial frames are reference frames in which Newton's first law of inertia holds: any object's acceleration is zero if no net force acts on the object. In other words, if no unbalanced external forces are acting on a moving object, then the object moves in a straight line. It doesn't curve or go into orbit. And it travels equal distances in equal amounts of time. Any frame of reference moving at constant velocity relative to an inertial frame is also an inertial frame. A reference frame spinning relative to an inertial frame isn't an inertial frame. The presence of gravitation normally destroys any possibility of finding a frame that is a perfect inertial frame, but a reference frame in which the 'fixed' stars are at rest is approximately an inertial reference frame, as is any reference frame moving at constant velocity with respect to the 'fixed' stars. Is a reference frame attached to Earth an equally good approximation to an inertial reference frame? Not quite. The frame is spinning relative to the heavenly bodies; and the gravitational forces due to the Moon, Sun and planets will make Newton's law fail; but for many situations these influences are negligible, and computations using special relativity or even Newton's mechanics give fine results.

What is spacetime?

Spacetime is a certain 4-d space (or 4-d manifold, to use Riemann's term for space). It's the 4-d

continuum we live in. Spacetime is the intended model of the general theory of relativity. This requires it to be a differentiable space in which certain geometrical objects obey the covariant field equations of general relativity, and in which physical objects obey the equations of motion of the theory. The metaphysical question of whether spacetime is a substantial object or a relationship among events, or neither, is taken up in the discussion of the relational theory of time. Regardless of how that question is answered, spacetime is more fundamental in science than either space or time alone. Einstein's general theory of relativity (1915) assumes that spacetime is fundamental, with space and time being two distinct sub-spaces of it.

Spacetime is a continuum in which we can define points and straight lines. However, these points and lines do not satisfy the principles of Euclidean geometry. Einstein's principal equation in his general theory of relativity implies that the curvature of the geometry of spacetime is directly proportional to the density of mass in the spacetime. The equation can be interpreted as implying that matter causes curvature in the spacetime geometry, or vice versa. The region of spacetime at the center of a black hole develops infinitely large curvature. Curvature of spacetime is a curvature of its space part, not its time part. Mass doesn't cause time to curve.

Regions of spacetime are frequently pictured with a Minkowski diagram using a rectangular coordinate system. The vertical 'time' axis is the product of time and the speed of light so that world lines of light rays leaving the origin make a forty-five degree angle with any space axis. The Minkowski diagram applies to a particular observer who experiences the event that occurs at the point indicated by the diagram's origin. In a Minkowski diagram, an ideally small physical particle is not represented as occupying a point of spacetime but as occupying a line containing all the spacetime points at which it exists. The line is called the "world line" of the particle. If two world lines intersect, then the two particles have collided. A person's world line is composed of the world lines of the person's component particles. Inertial motion corresponds to straight world lines, and accelerated motion corresponds to curved world lines.

Although relativity theory assumes that spacetime is fundamental, there have been serious attempts over the last few decades to construct theories of physics in which spacetime is not fundamental but is a product of more basic entities such as superstrings. The primary aim of these new theories is to unify relativity with quantum theory, but so far these theories have not stood up to any empirical observations or experiments that could show them to be superior to the presently accepted theories. So, spacetime remains fundamental.

What is an event?

An event might be defined simply as whatever is temporally before or after anything else. In ordinary discourse, an event is a happening during which some object changes its properties. The event of the buttering of the toast involves the toast's changing from having the property of being unbuttered to having the property of being buttered. In ordinary discourse, an event has more than an infinitesimal duration, but in the technical discourse of physics, all events are composed of point events. A point event is a spacetime point's having some property other than those it has just by being a location in spacetime. The point event is the having of some property at some point in space for an instant, with no change required. For example, there is the event of a certain point in spacetime having butter. The macroscopic event of a buttering of toast is composed of an infinite

number of point events involving the butter and toast. Although point events can be defined in terms of objects and properties and times in this way, point events and spacetime points actually are more basic in physics than are objects and properties. Point events are what all objects and events are made of, and spacetime points are what have the properties. The later Einstein moved away from the relational theory of time to the position that material objects are 'funny' places in the field, with the field itself being spacetime as characterized by the metric and stress-energy tensors. These metaphysical assumptions of modern science are not part of common sense, the shared background beliefs of most people. They also are not acceptable metaphysical assumptions for many philosophers. In 1936, Bertrand Russell and A. N. Whitehead developed a theory of time based on the assumption that all events in spacetime have a finite duration. However, they had to assume that any finite part of an event is an event, and this assumption is no closer to common sense than the physicist's assumption that all events are composed of point events.

Does the theory of relativity imply time is partly space?

In 1908, when Minkowski remarked that "Henceforth space by itself, and time by itself, are doomed to fade away into mere shadows, and only a kind of union of the two will preserve an independent reality," many people took this to mean that time is partly space, and vice versa. C. D. Broad countered that the discovery of spacetime did not break down the distinction between time and space but only their independence or isolation. He argued that their lack of independence does not imply a lack of reality. The Broad-Minkowski disagreement is still an issue in philosophy, but if Broad is correct, then time is time; it's not space at all. Nevertheless, there is a deep sense in which time and space are 'mixed up' or linked. This is evident from the Lorentz transformations of special relativity that connect the time t in one inertial frame with the time t' in another frame that is moving in the x direction at a constant speed v. The relationship is

$$t' = [t - vx/c^2]/[\text{square root}(1- v^2/c^2)]$$

In this equation, t' is dependent upon the space coordinate x and the speed. In this way, time is not independent of either space or speed. It follows that the time between two events could be zero in one frame but not zero in another. Each frame has its own way of splitting up spacetime into its space part and its time part. The reason time is not partly space is that time is not simply an arbitrary one-dimensional sub-space of spacetime; it is a *distinguished* sub-space. That is, time is a distinguished dimension of spacetime, not an arbitrary dimension. What being distinguished amounts to is that when you set up a rectangular coordinate system on spacetime with an origin at the signing of the Declaration of Independence in Philadelphia, you can point the x-axis east or north or up or anywhere in between, but you are not allowed to point it forward in time--you can do that only with the t-axis, the time axis.

Is time the fourth dimension?

Yes and no; it depends on what you are talking about. Time is the fourth dimension of spacetime, but time is not the fourth dimension of the space of places. Mathematicians have a broader notion of the term "space" than the average person; and in their sense a space need not consist of places,

that is, geographical locations. Not paying attention to the two meanings of the term "space" is the source of all the confusion about whether time is the fourth dimension. The 'space' of spacetime is four dimensional and in that space, the space of places is a 3-d sub-space. But spacetime is a space of events, not a space of places.

In any coordinate system on spacetime, it takes at least four independent numbers to determine a spacetime location. In any coordinate system on the space of places, it takes at least three. That's why spacetime is four dimensional but the space of places is three dimensional. Actually this 19th century definition of dimensionality, which is due to Bernhard Riemann, is not quite adequate because mathematicians have subsequently discovered how to assign each point on the plane to a point on the line without any two points on the plane being assigned to one point on the line. Consequently, the line and the plane have the same number of points, and the line and plane must have the same dimensions according to the definition. To avoid this problem, the dimensionality of a space has been given a rather complex new definition.

Is time infinite?

There are three ways to interpret this question: (a) Was there an infinite amount of time in the past? No, not if time began with the big bang. (b) Is time infinitely divisible? Yes, because general relativity and quantum mechanics require time to be a continuum. (c) Will there be an infinite amount of time in the future? This is difficult to judge. First, can time exist without events? If so, the future is infinite. If not, then we need to know whether events will keep occurring. The best estimate from the cosmologists these days is that the expansion of the universe will continue forever. There always will be the events of particles getting farther apart, and so future time will be infinite.

Is there more than one kind of physical time?

Every reference frame has its own physical time, but the question is intended in another sense. At present, physicists measure time electromagnetically. They define a standard atomic clock using periodic electromagnetic processes in atoms, then use electromagnetic signals (light) to synchronize clocks that are far from the standard clock. In doing this, are physicists measuring 'electromagnetic time' but not other kinds of physical time? In the 1930s, the physicists Arthur Milne and Paul Dirac worried about this question. Independently, they suggested there may be very many time scales. For example, there could be the time of atomic processes and light, which is measured best by atomic clocks. There also could be the time of gravitation and large-scale physical processes, which is measured best by the rotation of a pulsar (pulsating star). The two physicists worried that the atomic clock and the astronomical clock might drift out of synchrony after being initially synchronized, yet there would be no reasonable explanation for why they don't stay in synchrony. Ditto for clocks based on the pendulum, on superconducting resonators, on the spread of electromagnetic radiation through space, and on other physical principles. Just imagine the difficulty for physicists if they had to work with electromagnetic time, gravitational time, nuclear time, neutrino time, and so forth. Current physics, however, has found no reason to assume there is more than one kind of time for physical processes. In 1967, physicists did reject the

astronomical standard for the atomic standard because the deviation between known atomic and gravitation periodic processes could be explained better assuming that the atomic processes were the more regular of the two. Physicists had no reason to believe that a gravitational periodic process, that is just as regular initially as the atomic process and that is not affected by friction or impacts or other forces, would ever drift out of synchrony with the atomic process, yet this is the possibility that worried Milne and Dirac.

How is time relative to the observer?

Physical time is not relative to any observer's state of mind. Wishing time will pass does not affect the rate at which the observed clock ticks. On the other hand, physical time *is* relative to the observer's reference system--in a trivial way and in a deep way. In a trivial way, time is relative to the chosen coordinate system on the reference frame, though not to the reference frame itself. For example, it depends on the units chosen as when the duration of some event is 34 seconds if seconds are defined to be this long, but not if they are defined to be that long. Similarly, the difference between the Christian calendar and the Jewish calendar for the date of some event is due to a different unit and origin. Also trivially, time depends on the coordinate system when a change is made from the Eastern Standard Time to Pacific Standard Time. These dependencies are ignored when scientists measure the duration of a process that would be affected by them. For example, if a pendulum's approximately one-second swing is measured in a physics laboratory during the autumn night when the society changes from Daylight Savings Time back to Standard Time, the scientists do not note that one unusual swing of the pendulum took a negative one hour instead of the usual one second.

In a deeper sense there is relativity to the reference frame and not just to the coordinate system on that frame. That is Einstein's principal original idea about time. To illustrate for special relativity, let's assume that a number of observers are at rest in their inertial frames of reference. Which of these observers will agree on their time measurements? Observers with zero relative velocity will agree. Observers with different relative velocities will not, even if they agree on how to define the second and agree on some event occuring at time zero (the origin of the time axis). All observers will be observing the same objective reality, the same spacetime, but their different frames of reference will require disagreement about how spacetime divides up into its space part and its time part.

Relative to any observer, was Adolf Hitler born before George Washington? No, because the two events are causally connectible. That is, one event could in principle have affected the other since light would have had time to travel from one to the other. We can select a reference frame to reverse the usual Earth-based order of two events only if they are not causally connectible. Despite the relativity of time to a reference frame, all observers should agree about what happens before what when it comes to describing causally connectible events.

What are the relativity and conventionality of simultaneity?

Events that occur simultaneously with respect to one reference frame may not occur

simultaneously in another reference frame that is moving with respect to the first frame. This is called the "relativity of simultaneity," but this philosophically uncontroversial feature of time is different from the philosophically controversial feature called the "conventionality of simultaneity."

Given two events that happen essentially at the same place, physicists assume they can tell by direct observation whether the events happened simultaneously by direct observation. If we don't see one of them happening first, then we say they happened simultaneously, and we assign them the same time coordinate. The determination of simultaneity is more difficult if the two happen at separate places. One proper way to measure (operationally define) simultaneity at a distance is to say that two events are simultaneous in a reference frame if unobstructed light signals from the two events would reach us simultaneously when we are midway between the two places where they occur, as judged in that frame. This is the operational definition of simultaneity used by Einstein in his theory of relativity.

The 'midway' method described above of operationally defining simultaneity in one reference frame for two distant signals causally connected to us has a significant presumption: that the light beams travel at the same speed regardless of direction. Einstein, Reichenbach and Grünbaum have called this a reasonable "convention" because any attempt to experimentally confirm it presupposes that we already know how to determine simultaneity at a distance. This is the conventionality, rather than relativity, of simultaneity. To pursue the point, suppose the two original events are in each other's absolute elsewhere; they couldn't have affected each other. Einstein noticed that there is no physical basis for judging the simultaneity or lack of simultaneity between these two events, and for that reason said we rely on a convention when we define distant simultaneity as we do. Hillary Putnam objects to calling it a convention--on the grounds that to make any other assumption about light's speed would unnecessarily complicate our description of nature, and we often make choices about how nature *is* on the basis of simplification of our description. Putnam would say there is less conventionality in the choice than Einstein supposed.

The 'midway' method isn't the only way to define simultaneity. Consider a second method, the 'mirror reflection' method. Select an Earth-based frame of reference, and send a flash of light from Earth to Mars where it hits a mirror and is reflected back to its source. The flash occurred at 12:00, let's say, and its reflection arrived back on Earth 20 minutes later. The light traveled the same empty, undisturbed path coming and going. At what time did the light flash hit the mirror? The answer involves the so-called conventionality of simultaneity. All physicists agree one should say the reflection event occurred at 12:10. The controversial philosophical question is whether this is really a convention. Einstein pointed out that there would be no inconsistency in our saying that it hit the mirror at 12:17, provided we live with the awkward consequence that light was relatively slow getting to the mirror, but then traveled back to Earth at a faster speed. If we picked the impact time to be 12:05, we'd have to live with the fact that light traveled slower coming back. There is a physical basis for not picking the impact time to be less than noon nor later than 12:20, because doing so would violate the physical principle that causes precede their effects. One requirement we place on the concept of simultaneity is that distant events which are simultaneous could not be in causal contact with each other. We can satisfy that requirement for any choice of impact time from 12:00 to 12:20.

What is the difference between the past and the absolute past?

The events in your absolute past are those that could have directly or indirectly affected you, the observer, now. These are the events in or on the backward light cone of your present event, your here-and-now. The backward light cone of event E is the imaginary cone-shaped surface of spacetime points formed by the paths of all light rays reaching E from the past. An event's being in a point's absolute past is a feature of spacetime itself because the event is in the point's past in all possible reference frames. The feature is frame-independent. For any event in your absolute past, every observer in the universe (who isn't making an error) will agree the event happened in your past. Not so for events that are in your past but not in your absolute past. Past events not in your absolute past will be in what Eddington called your "absolute elsewhere." This is the region of spacetime containing events that are not causally connectible to your here-and-now. For example, the nearest star to the sun, Proxima Centauri, is four light-years away. Any event happening there now is in our absolute elsewhere and couldn't affect us. An explosion of that star four years ago, or earlier, could affect us now, but no later event there could have any effect on us. Your absolute elsewhere contains all present events [the events simultaneous with your here-and-now event] and also all the future events that are not in your absolute future. The absolute elsewhere is the region of spacetime that is neither in nor on either your forward or backward light cones.

A single point's absolute elsewhere, absolute future, and absolute past partition all of spacetime. Event A is in event B's absolute elsewhere if it is far enough away in distance but close enough to B in time that an unobstructed signal could not have arrived at A from B. If A is in B's absolute elsewhere the two events are also said to be "spacelike related." If the two are in each other's forward or backward light cones they are said to be "timelike related."

What is time dilation?

According to special relativity, a properly functioning clock moving relative to you will tick slower than your clock, assuming that measurements are made in inertial reference frames. The moving clock will show a smaller number of seconds have passed if it is used to measure the duration of the same event that your clock is used to measure. We sometimes speak of time dilation by saying time itself is 'slower' or dilated, but time isn't going slower in any absolute sense, only relative to some other frame of reference. Time doesn't actually have a rate.

Time dilation is not an illusion of perception; and it's not a matter of the second having different definitions in different reference frames. Also, it's not a Doppler effect. For example, if a flashing green light is accelerating rapidly away from you, then each pulse of light is redder and more delayed than the one sent out before it. So, the time between pulses appears to be longer than it properly is. If the flashing light were, instead, moving toward you, the effect would be reversed. The light would be bluer and the pulses closer together. However, the red-shifts and blue shifts due to the Doppler effect are not examples of time dilation. Time dilation isn't affected by the direction of motion, only by speed.

Time dilation due to difference in constant speeds is described by Einstein's special theory of relativity. The general theory of relativity describes a second kind of time dilation, one due to different accelerations and different gravitational influences. For more on general relativistic

dilation, see the discussion of gravity and black holes.

Newton's physics describes duration as an absolute property, implying it is not relative to the reference frame. However, he describes the speed of light as being relative to the frame. Einstein's special theory of relativity reverses both of these aspects of time. For inertial frames, it implies the speed of light is not relative to the frame, but duration *is* relative to the frame. In general relativity, however, the speed of light can vary within one reference frame if matter and energy are present.

To quantitatively illustrate time dilation due to motion, consider a properly functioning clock moving with a constant velocity v in an inertial frame. The time which elapses between two ticks of its second hand is not really the one second it has when it's at rest in the frame, but is the longer time of 1/square root($1-v^2/c^2$) seconds. The moving clock takes longer to tick. Its second lasts longer, and so we observers at rest in the frame judge the clock's ticking to be 'dilated' or spread out and thus slowed down relative to our clock. The moving clock is still accurate, though. Time really is going slower in moving inertial frames than in stationary ones.

Time dilation due to motion is relative in the sense that if your spaceship moves past mine so fast that I measure your clock to be running at half speed, then you will measure my clock to be running at half speed also, provided both of us are in inertial frames. If one of us is affected by a gravitational field or undergoes acceleration, then that person isn't in an inertial frame and the results are different. See the twins paradox for a discussion of that case.

Both types of time dilation by a significant role in time-sensitive satellite navigation systems such as the Global Positionining System. The atomic clocks on the satellites must be programmed to compensate for the relativistic dilation effects of both gravity and motion.

How does gravity affect time?

Einstein's general theory of relativity (1915) is a generalization of his special theory of special relativity (1905). It is not restricted to inertial frames, and it encompasses a broader range of phenomena, namely gravity and accelerated motions. According to general relativity, gravitational differences affect time by dilating it. Observers in a less intense gravitational potential find that clocks in a more intense gravitational potential run slow relative to their own clocks. People live longer in basements than in attics, all other things being equal. Basement flashlights will be shifted toward the red end of the visible spectrum compared to the flashlights in attics. This effect is known as the gravitational red shift. Even the speed of light is slower in the presence of higher gravity.

What happens to time near a black hole?

A black hole is a volume of very high gravitational field or severe warp in the spacetime continuum. Astrophysicists believe black holes are commonly formed by the inward collapse of stars that have burned out. The center of spherical black holes is infinitely dense. It is surrounded by an event horizon, a concentric sphere marking the point of no return. Anything getting that close could never escape the inward pull, even if it had an unlimited fuel supply and could travel at

near the speed of light. In relativity theory, the proper time along a world line is the time that would be shown on a clock whose path in spacetime is that world line. The proper time is not the same as the coordinate time, namely the time that would be measured for the same events along the world line by an ideal clock at the origin of the coordinate system. If we fix Earth in our coordinate system, then an astronaut flying into a distant black hole will take an infinite coordinate time to reach the center of the black hole, but will take only a finite proper time.

No local physical quantity is singular (infinite) at the event horizon. That is, if you were to freely fall through the event horizon, you wouldn't notice anything special there about your time or the speed of light. You'd notice something very odd about distant events, though. You'd notice distant processes speeding up. You'd never notice them achieving an infinite rate because you'd crash into the black hole's center before the information could reach you.

What is the solution to the twins paradox?

This paradox, also called the clock paradox, is an argument about time dilation that uses the theory of relativity to produce a contradiction. Consider two twins who were born at the same instant. They possess synchronized clocks. Twin 1 gets into a spaceship and flies away from Earth at a constant speed, then reverses course and flies back to Earth. According to the Earth-based reference frame, time dilation makes Twin 1's clock in the spaceship move slower than Twin 2's clock back on Earth. So, Twin 1 on the ship will be younger than Twin 2, when they meet again. However, it's all relative, isn't it? That is, when the situation is looked at from a reference frame fixed to the spaceship, it is the Earth clock that falls behind in its ticks. So, when the twins meet, Twin 1 on the ship will be older, not younger, than his Earth-based twin. Therefore, each twin will be younger than the other, and that is a contradiction. This argument is the twins paradox. The twin paradox doesn't require the moving twin either to fly in straight segments or to go far away. The flying twin might stay in a small volume and fly in circles.

The way out of the paradox is to notice that the inconsistent conclusion does not follow because there was an error in the reasoning about the spaceship-based frame. It is not even approximately an inertial frame, yet that assumption was being made implicitly in the reasoning. Another way to describe the mistake is to say that the reasoning in the paradox paid no attention to proper times but only to coordinate times and thus paid no attention to the radically large accelerations involved at the time when the Earth (and the stars) turn around and race back toward the spaceship. When these are taken into account by general relativity, the proper age of the spaceship-based twin is less than the proper age of the Earth-based twin regardless of which reference frame is used. A twin ages according to his or her proper time, not coordinate time, so it is proper times that should be compared when the twins have their reunion. The proper time of a twin is the time that would be read by a clock fixed to the twin, and this time depends on the history of the twin, on the twin's specific world line.

Sometimes when thinking about the twins paradox, people will ask whether the twins' age difference is relative to the frame. If two events happen at the same place at the same time in one reference frame, then the two are simultaneous in all reference frames. Therefore the age difference when the two twins reunite is the same in all reference frames, although their age difference is not the same while they are apart.

Discussions of the twins paradox normally disregard the gravitational time dilation caused by the Earth-bound twin remaining in a relatively larger gravitational field than the twin in the spaceship. This dilation works to the opposite effect, causing the Earth-bound twin to be relatively younger than the spaceship twin. It is interesting to speculate on whether the twins paradox argument can be constructed for a world containing no Earth and stars. With only two twins in the universe and nothing else, one twin moves rapidly away from the other, then returns. Do they meet again with the same ages or with different ages?

What is the solution to Zeno's paradoxes?

In about 445 B.C., the Greek philosopher Zeno of Elea offered several arguments that led to conclusions contradicting what we all know from our physical experience. The paradoxes had a dramatic impact upon the later development of mathematics, science, and philosophy. His most familiar paradox, the paradox of Achilles and the Tortoise, involves the fast-running Achilles and the slow-crawling tortoise. The tortoise has a head start. If Achilles hopes to overtake the tortoise, he must at least run to where the tortoise is, but by the time he arrives there, the tortoise has crawled to a new place. So, Achilles must run to the new place; but of course the tortoise isn't there, having crawled on to yet another place, and so on forever. Therefore, Zeno argues, good reasoning shows that fast runners never can catch slow ones. So much the worse for good reasoning. Notice that Zeno's reasoning rests on the assumption that time is continuous, that is, that time can be divided into infinitely many parts. We assume this continuity of time when we assume that a basektball dropped onto the court will bounce an infinite number of times before stopping.

In his Progressive Dichotomy Paradox, Zeno argued that a runner will never reach the goal line because he first must have time to reach the halfway point to the goal, but after arriving there he will need time to get to the 3/4 point, then the 7/8 point, and so forth. If the distance to the goal is, say, 1 meter, then the runner must cover a distance of 1/2 + 1/4 + 1/8 + ... meters. Zeno believed this sum is infinite and concluded that the runner will never have the infinite time it takes to reach this infinitely distant goal. Because at any time there is always more time needed, motion can never be completed. Worse yet, argued Zeno in his Regressive Dichotomy Paradox, the runner can't even take a first step. Any first step may be divided into a first half and a second half. Before taking a full step, the runner must have time to take a 1/2 step, but before that a 1/4 step, and so forth. The runner will need an infinite amount of time just to take a first step, and so will never get going.

Zeno's Arrow Paradox takes a different approach to challenging the coherence of the concepts of time and motion. Consider one instant of an arrow's flight. For that entire instant the arrow occupies a region of space equal to its total length, so at that instant the arrow isn't moving, he reasoned. If at every instant the arrow isn't moving, then the arrow can't move.

Yet another paradox created by Zeno attacks the notion that there are shorter and shorter times. Consider a duration of one second. It can be divided into two non-overlapping parts. They, in turn, can be divided, and so on. At the end of this infinite division we reach the elements. Here there is a problem. If these elements have zero duration, then adding an infinity of zeros yields a zero sum, and the total duration is zero seconds, which is absurd. Alternatively, if that infinite division produced elements having a finite duration, then adding an infinite number of these together will

produce an infinite duration, which is also absurd. So, a second lasts either for no time at all or else for an infinite amount of time.

These paradoxes by Zeno can be considered to challenge the notion that time (and space) is continuous. Some of his other paradoxes, not discussed here, challenge the presumption that time might be discrete or discontinuous, with instants being like atoms of time.

Zeno's paradoxical arguments are valid, given his assumptions about space, time, motion and mathematics; and they reveal the underlying incoherence in ancient Greek thought, an incoherence that was not adequately resolved for 2,300 years. The way out of Zeno's paradoxes requires revising the concepts of duration, distance, instantaneous speed, and sum of a series. The relevant revisions were made by Leibniz, Newton, Cauchy, Weierstrass, Dedekind, Cantor, Einstein, and Lebesque over two centuries. The notion of infinite sums of numbers had to be revised so that an infinite series of numbers that decrease sufficiently rapidly can have a finite sum. Although 1/2 + 1/3 + 1/4 +... is infinite, the more rapidly decreasing series 1/2 + 1/4 + 1/8 +... is 1. The other key idea was to appreciate that durations and distances must be topologically like an interval of the linear continuum, a dense ordering of uncountably many points. Although individual points of the continuum have zero measure (that is, zero 'total length'), the modern notion of measure on the linear continuum does not allow the measure of a segment (continuous region) to be the sum of the measures of its individual points, as Zeno had assumed in his argument against plurality. With these contemporary concepts, we can now make sense of Achilles covering an infinite number of distances in a finite time while running at a normal, finite speed. The new concepts restore the coherence of mathematics and science with our experience of space and time, and they are behind today's declaration that Zeno's arguments are based on naive and false assumptions.

How do time coordinates get assigned to points of spacetime?

A reference system is a reference frame plus either a coordinate system or an atlas of coordinate systems placed by the analyst upon the space to uniquely name the points. These names or coordinates are frame dependent in that a point can get new coordinates when the reference frame is changed. For spacetime, a coordinate system is a grid of smooth timelike and spacelike curves on the spacetime, it assigns each point three space coordinate numbers and one time coordinate number. Inertial frames can have global coordinate systems, but if we are working with general relativity where we cannot assume inertial frames, then the best we can do is to assign a coordinate system to a small region of spacetime where the laws of special relativity hold to a good approximation. General relativity requires special relativity to hold locally, and thus for spacetime to be Euclidean locally. So spacetime allows coordinate systems locally. Consider two coordinate systems on adjacent regions. For adjacent regions we make sure that the 'edges' of the two coordinate systems match up in the sense that each point near the intersection of the two coordinate systems gets a unique set of four coordinates and that nearby points get nearby coordinate numbers. The result is called an "atlas" on spacetime.

For small regions of spacetime, we create a coordinate system by choosing a style of grid, say rectangular coordinates, fixing a point as being the origin, selecting one timelike and three spacelike lines to be the axes, and defining a unit of distance for each dimension. We cannot use

letters for coordinates. The alphabet's structure is too simple. Integers won't do, either; but real numbers are adequate to the task. The definition of "coordinate system" requires us to assign our real numbers in such a way that numerical betweenness among the coordinate numbers reflects the betweenness relation among points. For example, if we assign numbers 17, pi, and 101.3 to instants, then every interval of time that contains the pi instant and the 101.3 instant had better contain the 17 instant. There is no way to select one point of spacetime and call it the "origin" of the coordinate system except by reference to actual events. In practice, we make the origin be the location of a special event, such as the birth of Jesus, or a selected tick of our atomic clock in Greenwich, England.

The choice of the unit presupposes we have defined what "distance" means. The metric for a space specifies what is meant by distance in that space. The natural metric between any two points in a one-dimensional space, such as the time sub-space of our spacetime, is the numerical difference between the coordinates of the two points. Using this metric, the duration between the 11:00 instant and the 11:05 instant is five minutes. The metric for spacetime defines the 'spacetime interval' between two spacetime locations, and it is more complicated than the metric for time alone. The spacetime interval between any two events is unchanged by a change to any other coordinate system, although the spatial distances and durations do change. A metric on a subspace is fixed by the metric defined on the full space.

Philosophers dispute the extent to which the choice of metric is conventional rather than forced by nature. Taking the conventional side, Adolf Grünbaum argues that time is metrically amorphous. It has no intrinsic metric in the sense of its structure determining the measure of durations. Instead, we analysts establish durations between instants by the way we assign coordinates to instants. If we were to say the instant at which Jesus was born and the instant at which Abraham Lincoln was assassinated occurred only 24 seconds apart, whereas the duration between Lincoln's assassination and his burial is 24 billion seconds, then we can't be mistaken. It's up to us to say what is correct when we first create our conventions about measuring duration. We can consistently assign any numerical time coordinates we wish, subject only to the condition that the assignment properly reflect the betweenness relations of the events that occur at those instants. That is, if event J (birth of Jesus) occurs before event L (Lincoln's assassination) and this in turn occurs before event B (burial of Lincoln), then the time assigned to J must be numerically less than the time assigned to L, and both must be less than the time assigned to B. $t(J) < t(L) < t(B)$. A simple requirement. It is other requirements that lead us to reject the above convention about 24 seconds and 24 billion seconds as unhelpful. What requirements? We've found that, for doing science, certain processes are better called "regular" than others. Pendulum swings are more regular than repeated barks of a dog. Periodic appearances of the sun overhead are more regular than rainstorms. A good convention for what is regular will make it easier for scientists to explain what causes other events to be irregular. It is the search for regularity that leads us to adopt the conventions for numerical time coordinate assignments that we do.

In this discussion, there is no need to worry about the distinction between change in metric and change in coordinates. For a space that is topologically equivalent to the real line and for metrics that are consistent with that topology, each coordinate system determines a metric and each metric determines a coordinate system. More precisely, once you decide on a positive direction in the one-dimensional space and a zero-point for the coordinates, then the possible coordinate systems and the possible metrics are in one-to-one correspondence.

There are still other restrictions on the assignments of coordinate numbers. The restriction that we called the "conventionality of simultaneity" fixes what time slices of spacetime can be counted as collections of simultaneous events. An even more complicated restriction is that coordinate assignments satisfy the demands of general relativity. The metric of spacetime is not global but varies from place to place due to the presence of matter and gravitation. Spacetime cannot be given its coordinate numbers without our knowing the distribution of matter and energy. However, for very small regions of spacetime, the general relativistic metric tensor reduces to the metric for special relativistic spacetime.

How do dates get assigned to actual events?

Our purpose in choosing a coordinate system or atlas to assign real numbers to all spacetime points is to express relationships among actual and possible events. The relationships we are interested in are order relationships (Did this event occur between those two?) and magnitude relationships (How long after A did B occur?). The date of a (point) event is the time coordinate number of the spacetime location where the event occurs. We expect all these assignments of dates to events to satisfy the requirement that event A happens before event B iff t(A) < t(B), where t(A) is the time coordinate of A. The assignments of dates to events also must satisfy the demands of our physical theories, and in this case we face serious problems involving inconsistency as when a geologist gives one date for the birth of Earth and an astronomer gives a different date.

It is a big step from assigning numbers to points to assigning them to real events. Here are some of the questions that need answers. How do we determine whether a nearby event and a distant event occurred simultaneously? How do we operationally define the second so we can measure whether one event occurred exactly one second later than another event? How do we know whether the clock we have is accurate? Attention must also be paid to the dependency of dates due to shifting from Standard Time to Daylight Savings Time, to crossing the International Date Line, and to switching from the Julian to the Gregorian Calendar.

Let's design a coordinate system. Suppose we have already assigned a date of zero to the event that we choose to be at the origin of our coordinate system. To assign dates to other events, we first must define a standard clock and declare that the time intervals between any two consecutive ticks of that clock are the same. The second will be defined to be so many ticks of the standard clock. We then synchronize other clocks with the standard clock so the clocks show equal readings at the same time. The time at which a point event occurs is the number reading on the clock at rest there. If there is no clock there, the assignment process is more complicated.

We want to use clocks to assign a time even to distant events, not just to events in the immediate vicinity of the clock. To do this correctly requires some appreciation of Einstein's theory of relativity. A major difficulty is that two nearby synchronized clocks, namely clocks that have been calibrated and set to show the same time when they are next to each other, will not in general stay synchronized if one is transported somewhere else. If they undergo the same motions and gravitational influences, they will stay synchronized; otherwise, they won't. For more on how to assign dates to distant events, see the discussion of the relativity and conventionality of simultaneity.

As a practical matter, dates are assigned to events in a wide variety of ways. The date of the birth of the Sun is measured very differently from dates assigned to two successive crests of a light wave. For example, there are lasers whose successive crests of visible light waves pass by a given location every 10 to the minus 15 seconds. This short time isn't measured with a stopwatch. It is computed from measurements of the light's wavelength. We rely on electromagnetic theory for the equation connecting the periodic time of the wave to its wavelength and speed. Dates for other kinds of events also are often computed rather than directly measured with a clock.

What is essential to being a clock?

Clocks record numerical information about time. They measure the quantity of time, the duration. A clock is basically an instrument for creating a periodic process and counting the periods. The goal is for each period to last the same amount of time. If the periods have the same duration, the clock is said to tick uniformly, or regularly.

Usually we assume that a clock is very small and that it can count high enough to be a calendar, although this is rarely the case with real clocks. To calibrate a clock, we associate a second with so many counts of its periodic process so that it is synchronized with the standard clock. That is, for any one event, say a 'tick', when our clock and the standard clock are near each other, we want them to assign the same time numbers to that event. Calibrated clocks assign a certain number of seconds to the time that elapses between two events (ticks) of the clock itself. Assuming there is no difficulty in telling which clock tick is simultaneous with which event that occurs in the immediate vicinity of the clock, then the clock is ready to report the time of any event in its immediate vicinity. The event outside the clock gets the same number as the tick that was simultaneous with the event. If the assumptions of special relativity do not hold, then a clock isn't really measuring the time between two events in any reference frame other than one fixed to the clock. In other words, a clock measures the elapsed proper time only between events that occur along its own world line.

What is our standard clock?

By current convention, the standard clock is the clock we agree to use for defining the second. The standard second is defined to be the duration of 9,192,631,770 periods (cycles, oscillations, vibrations) of the microwave radiation in the standard clock. More specifically, the second is defined to be the duration of 9,192,631,770 periods of the microwave radiation required to produce the maximum fluorescence of cesium 133 atoms (that is, their radiating a specific color of light) as the atoms make a transition between two specific hyperfine energy levels of the ground state of the atoms.

Atoms of cesium with a uniform energy are sent through a chamber that is being irradiated with these microwaves. The frequency of these microwaves is tuned until the maximum number of cesium atoms flip from one energy to the other, showing that the microwave radiation frequency is now precisely tuned to be 9,192,631,770 vibrations per second. Because this frequency for maximum fluorescence is so stable from one experiment to the next, the vibration number is

accurate to so many significant digits. The National Institute of Standards and Technology's F-1 atomic fountain clock, which was adopted in late 1999 as the primary time standard of the United States, is so accurate that it drifts by less than one second every 20 million years.

The standard clock is used to fix the units of all lengths. The unit of length depends on the unit of time. The meter depends on the second. It does not follow from this, though, that time is more basic than space. All that follows is that time measurement is more basic than space measurement. And this has to do with convention and with the fact that current science is capable of measuring time more precisely than space.

The meter is then defined in terms of time as the distance light travels in exactly 0.000000003335640952 seconds or 1/299,792,458 seconds. That number is picked so that the new meter will be nearly the same distance as the old meter, which was the distance between two marks on a platinum bar that was kept in the Paris Observatory.

These standard definitions of the second and the meter amount to defining or fixing the speed of light in all inertial frames. The speed is exactly one meter per 0.000000003335640952 seconds or 299,792,458 meters per second (about a foot per nanosecond). There can no longer be any direct measurement to see if that is how fast light REALLY moves in an inertial frame; it is simply defined to be moving that fast. Any measurement that produced a different value for the speed of light would be presumed initially to have an error in, say, its measurements of lengths and durations, or in its assumptions about the influence of gravitation and acceleration. This initial presumption comes from a deep reliance by scientists on Einstein's theory of relativity. However, if it were eventually decided by the community of scientists that the theory of relativity is incorrect and that the speed of light shouldn't have been fixed as it was, then the scientists would call for a new world convention to re-define the second. Some physicists believe that a better system of units would first define the speed of light, then define the second, and then make the meter be a computed consequence of these.

Why are some standard clocks better than others?

We choose as our standard clock our best clock, the one with the least drift. Other clocks ideally are calibrated by being synchronized to this clock. Our goal in selecting a standard clock is to find a periodic (cyclic) process that, if adopted as our standard, makes the resulting system of physical laws much simpler and more useful than if we were to have chosen some alternative periodic process such as the periodic dripping of water from our goat skin bag or even the revolution of the Earth about the Sun. We say the standard clock has the "least drift"of all clocks, by which we just mean that it's the best choice for a standard when all factors are considered.

Originally, the standard clock was defined astronomically in terms of the revolution of the Earth. The second was defined to be 1/86,400 of the mean solar day, the average rotational period of the Earth with respect to the Sun. Now we've found a better standard clock, an atomic clock. All atomic clocks measure time in terms of the natural resonant frequencies of various atoms and molecules. The periodic behavior of a super-cooled cesium atomic clock is the best practical standard clock we have so far discovered. Why is choosing it better than choosing an astronomical process such as the yearly motion of the Earth around the Sun? The brief answer is that the

sloshing of the tides is affecting the rotation of the Earth. The longer and more philosophical answer is that by using this astronomical clock as standard, all sorts of artificial complications are required to explain why cesium-133 atoms and other atomic processes do not behave uniformly as time goes on. On the other hand, by switching to the cesium atomic standard, these alterations are unnecessary, and we can readily explain the non-uniform wobbling of the Earth's yearly revolutions by reference to the tides on the Earth, the gravitational pull of other planets, dust between planets, and collisions with comets. These influences affecting a solar clock do not affect the cycles of the cesium atom. One other advantage of the cesium clock is that it provides a standard that is reproducible anywhere in the universe.

However, in order to keep our atomic-based calendar in synchrony with the rotations and revolutions of the Earth, say, to keep atomic-noons occurring on astronomical-noons and ultimately to keep Northern hemisphere winters from occurring in some future July, we systematically add leap years and leap seconds in the counting process. These changes don't affect the duration of a second, but they do affect the duration of a year because, with leap years, not all years last the same number of seconds.

We are lucky to live in a universe having a large number of different processes that bear consistent time relations or frequency of occurrence relations to each other. For example, the frequency of a fixed-length pendulum is a constant multiple of the half life of a specific radioactive uranium isotope; the relationship doesn't change as time goes by (at least not much and not for a long time). The existence of these sorts of relationships make our system of physical laws much simpler than it otherwise would be.

The Internet Encyclopedia of Philosophy

Timon (fl. 279 BCE.)

Disciple of Pyrrho and philosopher of the sect of the Skeptics, who flourished in the reign of Ptolemy Philadelphus, about 279 BCE. and onwards.

Life. The son of Timarchus of Phlius, Timon first studied philosophy at Megara, under Stilpo, and then returned home and married. He next went to Elis with his wife, and heard Pyrrho, whose tenets he adopted. Driven from Elis by straitened circumstances, he spent some time on the Hellespont an the Propontis, and taught at Chalcedon as a sophist with such success that he acquired a fortune. He then moved to Athens, where he passed the remainder of his life, with the exception of a short residence at Thebes. He died at the age of almost ninety.

Philosophy. Timon appears to have had an active mind, and with a quick perception of the follies of people which betrays its possessor into a spirit of universal distrust both of men and truths, so as to make him a skeptic in philosophy and a satirist in everything. His agnosticism (to use a modern term) is shown by his saying that people need only know three things -- viz. what is the nature of things, how we are related to them, and what we can gain from them. But as our knowledge of things must always be subjective and unreal, we can only live in a state of suspended judgment. He wrote numerous works both in prose and poetry. The most celebrated of his poems were the satiric compositions called *silli*, a word of somewhat doubtful etymology, but which undoubtedly describes metrical compositions of a character at once ludicrous and sarcastic. The invention of this species of poetry is ascribed to Xenophones of Colophon. The *Silli* of Timon were in three books, in the first of which he spoke in his own person, and the other two are in the form of a dialogue between the author and Xenophanes of Colophon, in which Timon proposed question,s to which Xenophanes replied at length. The subject was a sarcastic account of the tenets of all philosophers, living and dead -- and unbounded field for skepticism and satire. They were in hexameter verse, and from the way in which they are mentioned by the ancient writers, as well as from the few fragments of them which have come down to us, it is evident that they were admirable productions. (Diog. Laert. ix. 12, 109-155; Euseb. *Praep. Ev.* xiv. p. 761).

Totem

The term "totem" is a native North American term which is now applied broadly to a class of material objects (animals, plants) which the members of a community regard with respect, to which they hold themselves to be peculiarly and intimately related, and which becomes the social bond of union between fellow clansmen. The term was introduced by J. Long in 1791. The totem is both religious and social. Its origin cannot be traced, but its extreme diffusion, both geographical and historical, entitles it to be regarded as a highly important factor in primal mental life. It may be related to fetishism, but differs from the latter not only in its social significance, but also in that the influence attached to the totem covers all objects of a certain class, while the fetishistic powers reside in a special individual object only. The religious aspect of the totem is apt to involve the belief, or the myth, that the clan was by some mystery or miracle descended from the totemic animal or object. Such animals or objects thus become sacred, are tabooed as food, or for use in dress, and the proscription may extend even to the mention or sight of the objects. The totem is looked to for protection from evil and the cure of disease. It is worshipped and respected, and a corresponding benefit is expected from the totemic influence, while violations of its sacredness are severely punished. It enters into the ceremonies which attend birth, marriage, and death, and the assumption of the totem may characterize the rites of puberty.

Besides the clan totems there are also, but far less frequently, totems for men and women separately, and individual or private totems. The last may be selected by divination at the time of birth, or by dreaming of it at puberty, or in any other way which would naturally bring about a mysterious and hallowed connection. On the social side, the totem gives rise to a more or less elaborate system of clan and family relationships which may properly be spoken of as totemism. Indeed, the totemic is frequently a stronger tie than the family connection, and becomes a mark of cognizance for each member of the clan. The custom of exogamy (or marriage outside the clan or totem) requires a sharp recognition of the totem, and brings about a double totem, that of father and mother. According to the rule of descent, whether by father or mother (the latter more usually), the paternal or maternal totem passes to the child, thus ever widening and complicating the clan relations and regulations. The further recognition of special tribes as suitable companions for marriage, and the presence of sub-totems in special branches, may develop a most elaborate and complicated system of relationships. The totem becomes an important symbol of kinship, and is thus used in architecture (totem poles), in dress and in decoration.

Tragedy

The term "tragedy" derives from the Greek literally means "goat-song," perhaps from goatskin costumes worn by early tragic singers in imitation of satyrs. In aesthetics, tragedy is the quality of experience whereby, in and through some serious collision followed by fatal catastrophe or inner ruin, something valuable in personality becomes manifest, either as sublime or admirable in the hero, or as triumph of an idea. The situation itself or its portrayal is termed tragedy. The characteristic subjective effect is that of a complex of strongly painful and pleasurable elements existing simultaneously, both of which may be regarded as arising from sympathy: the painful elements from sympathy with the sufferer in evil, present or future (pity and fear), and the pleasurable from sympathy with the noble or heroic character displayed, or with the triumph of some idea (as in the case of guilt overtaken by catastrophe). In the case of the tragic in art, there is the additional element of the aesthetically pleasing form in which the action, character, or situation is presented. The tragic presupposes a greater magnitude in its objects or events than is necessarily involved in pathos and usually involves a more active collision.

Plato pointed out the mixed character of the feeling of the tragic. Aristotle noted the serious quality and the element of magnitude in tragedy, named pity and fear as the emotion is excited, and stated the result of tragedy to be the effecting of a catharsis (or purging) of such passions. He suggested also that the tragic catastrophe results from some fault or error. This, as the theory of tragic, has been developed in various aspects by German Idealists. Hegel regards it as the triumph of the universal, the idea, and the destruction of the individual. "Presumption" or overstepping of the due bounds of finiteness on the part of the individual has been emphasized as tragic motive by Vischer, Carriere, and Zeising. The inevitable and inherently necessary character of the collision or catastrophe in many cases enhances the tragic effect. This has been interpreted optimistically, by Hegel, Vischer, Carriere and Schiller (who in some way make the loss of the individual exhibit the triumph of the idea, or of the moral nature). It has also been interpreted pessimistically by Schopenliauer and Bahnsen. Others (Lipps, Volkelt) reject the theory of guilt or poetic justice as applicable to more than a portion of tragic situations.

The Internet Encyclopedia of Philosophy

Universals

A universal can be defined as an abstract object or term which ranges over particular things. The classic problem of universals involves whether abstract objects such as "largeness" exist in a realm independent of human thought. Realists argue that they do.

Plato, the first and most extreme realist, argued that universals are forms and exist in their own spiritual realm. Individual objects, such as a large mountain, then participate in the universal form largeness. A universal can only be known by the intellect, and not the senses. Plato's metaphysics and epistemology centered around the concept of the universal: to have knowledge of a particular object, we need to access the unchanging universals. The particulars, for Plato, are only manifestations of the forms. Plato's theory is subject to the problem of explaining how universals are represented in their particulars and how a universal can reside in a particular.

Aristotle criticizes Plato's theory for introducing an aspect of separateness to the universal which was unneeded; He also attacks Plato for holding that a universal was a property as well as a substance. Aristotle believed that universals did not existent independently of particulars. He thought of universals as only being present in the particular things encountered through experience, thus rejecting any concept of "the forms." Aristotle too believed that universals such as "color" exist independently of human thought, but not in a spiritual form-like realm. Instead, universals are to be found in the specific shared attributes of individual objects. For example, the abstract object "greenness" is found in the class of all green individual objects, such as trees and grass.

Augustine sides with Plato's account of the universals, because he believed Aristotle's version did not adequately separate human abilities from those of the beasts. Aristotle believed universals were arrived at only through experience, which, to Augustine, could be accomplished by lower animals as well. For Augustine, humans are unique in our their ability to grasp *a priori* truths.

Aquinas disagreed with Augustine and Plato and developed the "shared attribute" realism of Aristotle. Universals , for Aquinas, are essences which do not exist without being in the world, but which may be arrived at without a supposed existence. Aquinas and Aristotle have been criticized for not adequately explaining how universals connect with particular things. They are also faulted for not addressing the possibility that classes are discovered by humans through experience and not created by the human mind.

English scholastic William of Ockham (d. 1347) takes an alternative approach called nominalism. Nominalism maintains that abstract objects do not exist in any real sense, but are simply general words that we apply to a collection of things. Thus, there is no non-mental or real thing which is a referent of our notion of "greenness". Extreme nominalists go a step further and argue that general terms (such as the word "greenness') are the only things which two given objects have in common (such as green grass and a green tree). One of Ockham's arguments for nominalism is based on a principle of simplicity known as Ockham's razor: plurality is never to be posited

without need. That is, do not postulate two realms of existence when one will do. The realist indeed posits three realms of existence: (1) individual objects, (2) the independent attributes which they have in common and (3) our concepts of these. On Ockham's account there are only two: (1) individual objects and (2) our concepts/words about those objects.

In the modern period, Locke argued that the universal did not reside in any particular objects or in another ideal realm. Instead, they are images in the human mind. This theory falls victim to the same criticism as Aristotle and Plato because it does not attempt to explain the application of the general words to particular instances. For Berkeley, universals are particular ideas associated with a general term which gives it a more extensive meaning. Berkeley objected to Locke's idea of universals representing mental images, since communicated words do not always produce the same mental image. Hume sided with Berkeley that universals were only particulars which represented other particulars with familiar aspects. Hume explained that representation takes place through association and habit. When we link certain objects with particular words enough times, that classes of things seem to develop.

Recent philosophers argue that necessary and sufficient conditions cannot be given as criteria for particular objects belonging to a group or universal. Creating these conditions either excludes particulars which we want to be included, or it includes so many particulars that it is difficult to determine a common strand. Wittgenstein believed that it is unnecessary to search for an exhaustive list of necessary and sufficient conditions for a universal because they do not exist, and, furthermore, we can operate with the concept "universal" with a flexible set of conditions that have a family resemblance. We arrive at these conditions by studying our use of language and how the words we use can have a common meaning which represent universal concepts.

Vienna Circle

Group of philosophers who gathered round Moritz Schlick, after his coming in Vienna in 1922. They organized a philosophical association, named Verein Ernst Mach (Ernst Mach Association). However, meetings on philosophy of science and epistemology began as early as 1907, promoted by Frank, Hahn and Neurath, who later arranged to bring Schlick at the University of Vienna. Among Vienna Circle's members were M. Schlick, R. Carnap, H. Feigl, P. Frank, K. G&oumldel, H. Hahn, V. Kraft, O. Neurath, F. Waismann. Also K. R. Popper and H. Kelsen had many contacts with the Vienna Circle, although they did not belong to it. At the meetings was also discussed Wittgenstein's *Tractatus*, and there were several meetings between Wittgenstein, Schlick, Waismann and Carnap. In 1929 Hahn, Neurath and Carnap published the manifesto of the circle: *Wissenschaftliche Weltauffassung. Der Wiener Kreis* (A scientific world-view. The Vienna Circle).

Vienna Circle was very active in advertising the new philosophical ideas of logical positivism. Several congresses on epistemology and philosophy of science were organized, with the help of the Berlin Circle. There were some preparatory congresses: Prague (1929), K&oumlnisberg (1930), Prague (1934) and then the first congress on scientific philosophy held in Paris (1935), followed by congresses in Copenhagen (1936), Paris (1937), Cambridge, England (1938), Cambridge, Mass. (1939). The K&oumlnisberg congress (1930) was very important, for G&oumldel announced he has proved the completeness of first order logic and the incompleteness of arithmetic. Another very interesting congress was the one held in Copenhagen (1936), which was dedicated to quantum physics and causality.

Between 1928 and 1937, the Vienna Circle published ten books in a series named *Schriften zur wissenschaftlichen Weltauffassung* (Papers on scientific world-view), edited by Schlick and Frank. Among these works was *Logik der Forschung*, 1935, which is the first book published by K. R. Popper. Seven works were published in another series, called *Einheitswissenschaft* (Unified science), edit by Carnap, Frank, Hahn, Neurath, Joergensen (after Hahn's death) and Morris (from 1938). In 1930 Carnap and Reichenbach undertook the editorship of the journal *Erkenntnis*, which was published between 1930 and 1940 (from 1939 the editors were Neurath, Carnap and Morris).

The following is the list of works published in the two series edit by the Vienna Circle.

> *Schriften zur wissenschaftlichen Weltauffassung* (Papers on scientific world-view), edit by Schlick and Frank.

R. von Mises, *Wahrscheinlichkeit, Statistik und Wahrheit*, 1928 (*Probability, statistics, and truth*, New York : Macmillan company, 1939)
R. Carnap, *Abriss der Logistik*, 1929
M. Schlick, *Fragen der Ethik*, 1930 (*Problems of ethics*, New York : Prentice-Hall, 1939)
O. Neurath, *Empirische Soziologie*, 1931

P. Frank, *Das Kausalgesetz und seine Grenzen*, 1932 (*The law of causality and its limits*, Dordrecth ; Boston : Kluwer, 1997)
O. Kant, *Zur Biologie der Ethik*, 1932
R. Carnap, *Logische Syntax der Sprache*, 1934 (*The logical syntax of language*, New York : Humanities, 1937)
K. R. Popper, *Logik der Forschung*, 1934 (*The logic of scientific discovery*, New York : Basic Books, 1959)
J. Schächeter, *Prologomena zu einer kritischen Grammatik*, 1935 (*Prolegomena to a critical grammar*, Dordrecth ; Boston : D. Reidel Pub. Co., 1973)
V. Kraft, *Die Grundlagen einer wissenschaftliche Wertlehre*, 1937 (*Foundations for a scientific analysis of value*, Dordrecth ; Boston : D. Reidel Pub. Co., 1981)

> ***Einheitswissenschaft* (Unified science), edit by Carnap, Frank, Hahn, Neurath, Joergensen (after Hahn's death), Morris (from 1938)**

H. Hahn, *Logik, Mathematik und Naturerkennen*, 1933
O. Neurath, *Einheitswissenschaft und Psychologie*, 1933
R. Carnap, *Die Aufgabe der Wissenschaftlogik*, 1934
P. Frank, *Das Ende der mechanistichen Physik*, 1935
O. Neurath, *Was bedeutet rationale Wirtschaftsbetrachtung*, 1935
O. Neurath, E. Brunswik, C. Hull, G. Mannoury, J. Woodger, *Zur Enzyclopädie der Einheitswissenschaft. Vorträge*, 1938
R. von Mises, *Ernst Mach und die empiritische Wissenschaftauffasung*, 1939
These works are translated in *Unified science - The Vienna Circle monograph series originally edited by Otto Neurath*, Kluwer, 1987.

The members of the Vienna Circle were dispersed when Nazi party went into power in Germany; many of them emigrated to USA, where they taught in several universities. Schlick remained in Austria, but in 1936 he was killed by a Nazi sympathizer student in the University of Vienna.

Virtue Theory

Virtue theory is the view that the foundation of morality is the development of good character traits, or virtues. A person is good, then, if he has virtues and lacks vices. Typical virtues include courage, temperance, justice, prudence, fortitude, liberality, and truthfulness. Some virtue theorists mention as many as 100 virtuous character traits which contribute to making someone a good person. Virtue theory places special emphasis on moral education since virtuous character traits are developed in one's youth; adults, therefore, are responsible for instilling virtues in the young. The failure to properly develop virtuous character traits will result in the agent acquiring vices, or bad character traits instead. Vices include cowardice, insensibility, injustice, and vanity.

HISTORY. Historically, virtue theory is the oldest normative tradition in Western philosophy, having its roots in ancient Greek civilization. Greek epic poets and playwrights, such as Homer and Sophocles, paint the morality of their heroes and antiheroes in terms of their respective virtues and vices. Plato believed that an integral part of one's quest for truth was understanding the ideal nature of virtues such as justice, piety, and courage. The earliest and most influential systematic account of virtue theory appears in Aristotle's Nichomachean Ethics, the heart of which is his account of moral virtues in Book two. There he argues that moral virtues are desire-regulating character traits which are at a mean between more extreme character traits (or vices). For example, in response to the natural emotion of fear, we should develop the virtuous character trait of courage. If we develop an excessive character trait by curbing fear too much, then we are said to be rash, which is a vice. If, on the other extreme, we develop a deficient character trait by curbing fear too little, then we are said to be cowardly, which is also a vice. The virtue of courage, then, lies at the mean between the excessive extreme of rashness, and the deficient extreme of cowardice. Most moral virtues, and not just courage, are to be understood as falling at the mean between two accompanying vices. Aristotle illustrates this with the virtues of temperance, liberality, magnificence, high-mindedness, controlled anger, friendliness, modesty, and righteous indignation. He concludes that it is difficult to live the virtuous life primarily because it is often difficult to find the mean between the extremes.

During the late Greek period, Aristotle's account of virtue ethics competed with rival moral theories, particularly those offered by Epicureanism and Stoicism. However, by the late Middle Ages Aristotle's virtue theory was the definitive account of morality, especially insofar as it was endorsed by medieval philosopher Thomas Aquinas. In medieval discussions, the particular virtues described by Aristotle and the ancient Greeks became known as the cardinal virtues. Medieval ethicists added to these the theological virtues which appear in the New Testament: faith, hope, and charity. With the waning of the Middle Ages and the rise of the Renaissance, the Scientific Revolution, and Enlightenment thought, the influence of Aristotle's virtue ethics declined. Historians of philosophy typically say that virtue ethics was neglected or ignored in the centuries which followed. However, in "The Misfortunes of Virtue" (1990) J.B. Schneewind argues that the fate of virtue ethics was not one of neglect, but instead, one of critique, revision, and eventually

abandonment in view of newer accounts of moral obligation. For Schneewind, virtue theory met its greatest challenge with the rise of natural law theory, particularly as put forward by 17th century Dutch philosopher Hugo Grotius. For Grotius, morality involves conforming one's actions to moral laws which are fixed in nature and which even God cannot change. Grotius rejects the role of virtue assigned by Aristotle, and directly criticizes Aristotle's theory on three accounts. First, Aristotle's doctrine of the mean fails to adequately explain basic moral concepts such as truthfulness and justice. Second, in the case of justice, the agent's particular motive does not matter. All that matters is following proper reason with respect to the rights of others. Third, contrary to Aristotle, the moral agent does not have special moral insight simply because she is virtuous. Instead, morality is fixed in natural laws which can be rationally perceived by all.

By the 19th century, the "rule" emphasis of moral theories such as utilitarianism supplanted the character trait emphasis of virtue theory. Within the past few decades there has been a revived interest in virtue theory, owing to seminal writings by Elizabeth Anscombe and Alasdair MacIntyre. MacIntyre in particular argues that today we have only fragments of conflicting moral traditions, and we need to re-establish the goal or meaning of life towards which ethics is directed. This meaning is established in the context of a moral tradition, particularly one which advocates virtuous character traits.

CONTEMPORARY ISSUES. The key issue of contemporary virtue theory is whether virtue ethics can be completely independent of moral rules. One view, called eliminatism, states that rules must be eliminated from all notions of virtue. That is, morality is founded entirely on virtuous character traits such as courage, and these virtues are independent of ideal principles. The eliminatist will argue that courage is simply the character trait of facing fear, even if we are thieves who are facing the fear of a confrontation with the police. Thus, particular actions are understood as mere expressions of character traits. This stands in sharp contrast to both consequentialist and non-consequentialist theories which judge morality solely on the agent's intended action, with no regard for the agent's good or bad character traits. There are, however, problems with this view. In real life situations, do we condemn people for having bad character traits, or, instead, for committing bad actions? Critics argue that people are condemned for their bad actions. For, character traits only inform us about the types of actions an agent is likely to perform, but this does not mean that the agent will in fact perform that action. It is, then, wrong to pass moral judgment on an agent simply on the basis of her character traits. Therefore, the agent's action is the object of our judgment.

In contrast to eliminatism, the essentialist will argue that there is either a single rule or a core set of rules, which universally establish when a character trait is good or bad. However, this concession to rules may be to much of a compromise, and may not constitute a genuine alternative to rule-based approach normative ethics. First, for any virtue we choose, such as truthfulness, we can postulate a corresponding duty, such as the duty to be truthful. Similarly, virtues such as courage, temperance, justice, prudence, fortitude, and liberality would all have corresponding duties. Second, it is the obligatory nature of virtues which distinguishes them from mere character traits (such as the character trait of habitually humming a tune). It seems, then, that our obligation to develop a virtue such as truthfulness in fact presupposes that we have a prior duty to be consistently truthful.

LOUDEN'S CRITIQUE. In "On Some Vices of Virtue Ethics" (1984), Robert Louden presents one of the most systematic attacks on contemporary virtue theory. Louden suggests that virtue (or

agent-centered) ethics differs from act-centered approaches in two ways. First, act-centered morality focuses on procedures for determining obligation, and virtue theory focuses on long-term patterns of action. Second, in act-centered morality, the motivation to be moral is found either in our duties themselves, or in our desire to be happy. By contrast, the motivation in virtue theory is the virtue itself.

Louden discusses several areas where act-centered morality has a distinct advantage over virtue ethics. First, virtue ethics fails to adequately address dilemmas which arise in applied ethics, such as abortion. For, virtue theory is not designed to offer precise guidelines of obligation. Second, virtue theory cannot correctly assess the occasional tragic actions of virtuous people (such as Oedipus accidentally sleeping with his mother). Since virtue theory focuses on the general notion of a good person, it has little to say about particular tragic acts. Third, some acts are so intolerable, such as murder, that we must devise a special list of offenses which are prohibited. Virtue theory does not provide such a list. Fourth, character traits change, and unless we stay in practice, we risk losing our proficiency in these areas. This suggests a need for a more character-free way of assessing our conduct. Finally, there is the problem of moral backsliding. Since virtue theory emphasizes long-term characteristics, this runs the risk of overlooking particular lies, or acts of selfishness, on the grounds that such acts are temporary aberrations.

Louden continues by discussing three specific problems which are unique to virtue theory. First, there is the problem of determining who is virtuous. It does not help to look for some external criterion such as visible indications in the agent's action. For, these indications are no guarantee that the person's inner being is virtuous. It also does not help to look for an inner criterion, such as the agent's self-respect or integrity. For, we do not have the ability to read ourselves internally. Second, by de-emphasizing the substance of an agent's action (such as the consequences of the action), virtue theory places on over-emphasizes on the mere style of an agent's conduct. Finally, The variety of values in our complex society encourages a legalistic approach to judging actions; it is naive (or utopian) for virtue theorists to believe they can alter this variety of values simply by re-emphasizing certain virtuous character traits.

Voluntarism

Voluntarism is the theory that God or the ultimate nature of reality is to be conceived as some form of will (or conation). This theory is contrasted to intellectualism, which gives primacy to God's reason. The voluntarism/intellectualism distinction was intimately tied to medieval and modern theories of natural law; if we grant that moral or physical laws issue from God, it next needs to answered whether they issue from God's will or God's reason. In medieval philosophy, voluntarism was championed by Avicebron, Duns Scotus, and William of Ockham. Intellectualism, on the other hand, is found in Averroes, Aquinas, and Eckhart. The oppising theories were applied to the human psychology, the nature of God, ethics, and the heaven. According to intellectualism, choices of the will result from that which the intellect recognizes as good; the will itself is determined. For voluntarism, by contrast, it is the will which determines which objects are good, and the will itself is indetermined. Concerning the nature of heaven, intellectualists followed Aristotle's lead by seeing the final state of happiness as a state of contemplation. Voluntarism, by contrast, maintains that final happiness is an activity, specifically that of love. The conceptions of theology itself were polarized between these two views. According to intellectualism, theology should be an essentiall speculative science; according to voluntarism, it is a practical science aimed at controlling life, but not necessarily aimed at comprehending philosophic truth.

In the modern period Spinoza advocates intellectualism insofar as desire is an indication of imperfection, and the passions are a source of human bondage. When all things are seen purely in rational relations, desire is stilled, the mind is freed from the passions and we experience the intellectual love of God, which is the ideal happiness. According to Leibniz, Spinoza's interpretation of the world as rational and logical left no place for the individual, or for the conception of ends or purposes as a determining factor in reality. Voluntarism is seen in Leibniz's view of the laws which govern monads (individual units of which all reality is composed) in so far as they are the laws of the conscious realization of ends.

19th century voluntarism has its origin in Kant, particularly his doctrine of the "primacy of the practical over the pure reason." Intellectually, humans are incapable of knowing ultimate reality, but this need not and must not interfere with the duty of acting as though the spiritual character of this reality were certain. Freedom cannot be demonstrated speculatively, but whenever a person acts under a motive supplied by reason, he is thereby exhibiting the practical efficiency of reason, and thus showing its reality in a practical sense. Following Kant, two distinct lines of voluntarism have proceeded which may be called rational and irrational voluntarism respectively. For Fichte, the originator of rational voluntarism, the ethical is primary both in the sphere of conduct and in the sphere of knowledge. The whole nature of consciousness can be understood only from the point of view of ends which are set up by the self. The actual world, with all the activity that it has, is only to be understood as material for the activity of the practical reason, as the means through which the will achieves complete freedom and complete moral realization. Schopenhauer's irrational voluntarism asserts a more radical opposition between the will and intellect. For him, the

will is by its very nature irrational. It manifests itself in various stages in the world of nature as physical, chemical, magnetic, and vital force, pre-eminently, however, in the animal kingdom in the form of "the will to live," which means the tendency to assert itself in the struggle for means of existence and for reproduction of the species. This activity is all of it blind, so far as the individual agent is concerned, although the power and existence of the will are thereby asserted continually.

W

- Warburton, William
- Wittgenstein, Ludwig

The Internet Encyclopedia of Philosophy

William Warburton (1698-1779)

Church of England bishop of Gloucester; b. at Newark-upon-Trent (17 m. n.e. of Nottingham) Dec. 24, 1698; d. at Gloucester June 7, 1779. His father, an attorney, had him educated for the law, which he probably practiced 1719-23; but he had always a passionate liking for theology, and was ordained deacon, 1723, and priest, 1727; he became rector-at Greaseley, Nottingham, 1726; was rector at Brant-Broughton, 1728-30; and at Frisby, 1730-56; became chaplain to the Prince of Wales, 173S; preacher to Lincoln's Inn, 1746; chaplain to the king, 1754; prebendary of Durham, 1755; dean of Bristol, 1757; and bishop of Gloucester, 1760. As a critic Warburton had a reputation for being excessively sarcastic and abusive. In the retirement of country life during the earlier years of his activity he prosecuted his studies with great diligence, and wrote those works which have perpetuated his memory. The first of these was *The Alliance between Church and State; or the Necessity and Equity of an established Religion, and a Test Law demonstrated, from the Essence and End of civil Society upon the fundamental Principles of the Laws of Nature and Nations* (1736), in which, while taking high ground, as the title indicates, he yet maintains that the State Church should tolerate those who differed from it in doctrine and worship. Soon thereafter came his great work, *The Divine Legation of Moses, Demonstrated on the Principles of a Religious Deist, from the Omission of the Doctrine of a Future State of Rewards and Punishments in the Jewish Dispensation*. Books I.-III. appeared in vol. I. (1737-38); books IV., V., VI., in vol. II. (1741); books VII. and VIII. never appeared; book IX. was first published in his *Works* (1788; 10th ed. Of the entire work, ed. James Nichols, 3 vols., 1846). The treatise was directed against the Deists (see also Deism), especially their doctrine of the Old Testament and their stress upon the omission of mention of immorality in the Old Testament. Warburton turns the tables upon them by constructing, out of the very absence of such statements, a proof of the divinity of the Mosaic legislation.

The first three books deal with the necessity of the doctrine of a future state of rewards and punishments to civil society from (1) the nature of the thing, (2) the conduct of the ancient lawgivers and founders of civil policy, and (3) the opinions and conduct of the ancient sages and philosophers. The fourth book proves the high antiquity of the arts and empire of Egypt, and that such high antiquity illustrates and confirms the truth of the Mosaic history. The fifth book explains the nature of the Jewish theocracy. In the sixth book Warburton shows from the Old and New Testaments that a future state of rewards and punishments did make part of the Mosaic dispensation. The ninth book treats of the true nature and genius of the Christian religion. The general argument is that because the sacred books of Judaism said nothing respecting a future state of rewards and punishments, it must be divine, since it did really accomplish the punishment of wrong-doers without such a doctrine, and no other legislation has been able to do so without it. This it could do because the foundation and support of the Mosaic legislation was the theocracy which was peculiar to the Jews, and dealt out in this life righteous rewards and punishments upon individual-and nation. An extraordinary providence conducted the affairs of this people, and

consequently the sending of Moses was divinely ordered. The work is confessedly limited to one line of argument, is defective in exegesis, and does not do justice to the intimations of immortality among the later Jews; yet it is distinguished by freshness and vigor, masterly argumentation, and bold imagination. The excursuses are particularly admirable. His writings, besides those already noted, embrace a commentary upon Pope's *Essay on Man* (1742; by this he won Pope's firm friendship); Julian (1750; on the numerous alleged providential interferences which defeated Julian's attempt to rebuild the temple); *Remarks on Mr. David Hume's Essay on The Natural History of Religion* (1757); *The Doctrine of Grace; or the Office and Operations of the Holy Spirit vindicated from the Insults of Infidelity and the Abuses of Fanaticism* (2 vols., 1762; a work directed against the Methodists, which did not advanace his reputation). His *Works* were edited with a biographical preface by Bishop Hurd (7 vols., 1788; new ed., 12 vols., 1811; the expense was borne by Warburton's widow). Supplementary to this edition are the *Tracts by Warburton and a Warburtonian* (1789); *Letters* (Kidderminster, 1808; 2d ed., London, 1809); *Selections from the Unpublished Papers of Warburton* (1841).

The Internet Encyclopedia of Philosophy

Ludwig Wittgenstein (1889-1951)

LIFE. Ludwig Josef Johann Wittgenstein, born on April 26th 1889 in Vienna, Austria, was a charismatic enigma. He has been something of a cult figure but shunned publicity and even built an isolated hut in Norway to live in complete seclusion. His sexuality was ambiguous but he was probably gay; how actively so is still a matter of controversy. His life seems to have been dominated by an obsession with moral and philosophical perfection, summed up in the subtitle of Ray Monk's excellent biography *Wittgenstein: The Duty of Genius.*

His concern with moral perfection led Wittgenstein at one point to insist on confessing to several people various sins, including that of allowing others to underestimate the extent of his 'Jewishness'. His father Karl Wittgenstein's parents were born Jewish but converted to Protestantism and his mother Leopoldine (nee Kalmus) was Catholic, but her father was of Jewish descent. Wittgenstein himself was baptized in a Catholic church and was given a Catholic burial, although between baptism and burial he was neither a practicing nor a believing Catholic.

The Wittgenstein family was large and wealthy. Karl Wittgenstein was one of the most successful businessmen in the Austro-Hungarian Empire, leading the iron and steel industry there. The Wittgensteins' home attracted people of culture, especially musicians, including the composer Johannes Brahms, who was a friend of the family. Music remained important to Wittgenstein throughout his life. So did darker matters. Ludwig was the youngest of eight children, and of his four brothers, three committed suicide.

As for his career, Wittgenstein studied mechanical engineering in Berlin and in 1908 went to Manchester, England to do research in aeronautics, experimenting with kites. His interest in engineering led to an interest in mathematics which in turn got him thinking about philosophical questions about the foundations of mathematics. He visited the mathematician and philosopher Gottlob Frege (1848-1925), who recommended that he study with Bertrand Russell (1872-1970) in Cambridge. At Cambridge Wittgenstein greatly impressed Russell and G.E. Moore (1873- 1958), and began work on logic.

When his father died in 1913 Wittgenstein inherited a fortune, which he quickly gave away. When war broke out the next year, he volunteered for the Austrian army. He continued his philosophical work and won several medals for bravery during the war. The result of his thinking on logic was the *Tractatus Logico-Philosophicus* which was eventually published in 1922 with Russell's help. This was the only book Wittgenstein published during his lifetime. Having thus, in his opinion, solved all the problems of philosophy, Wittgenstein became an elementary school teacher in rural Austria, where his approach was strict and unpopular, but apparently effective. He spent 1926-28 meticulously designing and building an austere house in Vienna for his sister Gretl.

In 1929 he returned to Cambridge to teach at Trinity College, recognizing that in fact he had more work to do in philosophy. He became professor of philosophy at Cambridge in 1939. During World War II he worked as a hospital porter in London and as a research technician in Newcastle. After

the war he returned to university teaching but resigned his professorship in 1947 to concentrate on writing. Much of this he did in Ireland, preferring isolated rural places for his work. By 1949 he had written all the material that was published after his death as *Philosophical Investigations*, arguably his most important work. He spent the last two years of his life in Vienna, Oxford and Cambridge and kept working until he died of prostate cancer in Cambridge in April 1951. His work from these last years has been published as *On Certainty*. His last words were, "Tell them I've had a wonderful life."

TRACTATUS LOGICO-PHILOSOPHICUS. Wittgenstein told Ludwig von Ficker that the point of the *Tractatus* was ethical. In the preface to the book he says that its value consists in two things: "that thoughts are expressed in it" and "that it shows how little is achieved when these problems are solved." The problems he refers to are the problems of philosophy defined, we may suppose, by the work of Frege and Russell, and perhaps also Schopenhauer. At the end of the book Wittgenstein says "My propositions serve as elucidations in the following way: anyone who understands *me* eventually recognizes *them* as nonsensical" [emphasis added]. What to make of the *Tractatus*, its author, and the propositions it contains, then, is no easy matter.

The book certainly does not seem to be about ethics. It consists of numbered propositions in seven sets. Proposition 1.2 belongs to the first set and is a comment on proposition 1. Proposition 1.21 is about proposition 1.2, and so on. The seventh set contains only one proposition, the famous "What we cannot speak about we must pass over in silence."

Some important and representative propositions from the book are these:

> 1 The world is all that is the case.
> 4.01 A proposition is a picture of reality.
> 4.0312 ...My fundamental idea is that the 'logical constants' are not representatives; that there can be no representatives of the *logic* of facts.
> 4.121 ...Propositions *show* the logical form of reality. They display it.
> 4.1212 What *can* be shown, *cannot* be said.
> 4.5 ...The general form of a proposition is: This is how things stand.
> 5.43 ...all the propositions of logic say the same thing, to wit nothing.
> 5.4711 To give the essence of a proposition means to give the essence of all description, and thus the essence of the world.
> 5.6 *The limits of my language* mean the limits of my world.

Here and elsewhere in the *Tractatus* Wittgenstein seems to be saying that the essence of the world and of life is: This is how things are. One is tempted to add "--deal with it." That seems to fit what Cora Diamond has called his "accept and endure" ethics, but he says that the propositions of the *Tractatus* are *meaningless*, not profound insights, ethical or otherwise. What are we to make of this?

Many commentators ignore or dismiss what Wittgenstein said about his work and its aims, and instead look for regular philosophical theories in his work. The most famous of these in the *Tractatus* is the "picture theory" of meaning. According to this theory propositions are meaningful insofar as they picture states of affairs or matters of empirical fact. Anything normative, supernatural or (one might say) metaphysical must, it therefore seems, be nonsense. This has been an influential reading of parts of the *Tractatus*. Unfortunately, this reading leads to serious problems since by its own lights the *Tractatus'* use of words like "object," "reality" and "world" is illegitimate. These concepts are purely formal or *a priori*. A statement such as "There are objects

in the world" does not picture a state of affairs. Rather it is, as it were, presupposed by the notion of a state of affairs. The "picture theory" therefore denies sense to just the kind of statements of which the *Tractatus* is composed, to the framework supporting the picture theory itself. In this way the *Tractatus* pulls the rug out from under its own feet.

If the propositions of the *Tractatus* are nonsensical then they surely cannot put forward the picture theory of meaning, or any other theory. Nonsense is nonsense. However, this is not to say that the *Tractatus* itself is without value. Wittgenstein's aim seems to have been to show up as nonsense the things that philosophers (himself included) are tempted to say. Philosophical theories, he suggests, are attempts to answer questions that are not really questions at all (they are nonsense), or to solve problems that are not really problems. He says in proposition 4.003 that:

> **Most of the propositions and questions of philosophers arise from our failure to understand the logic of our language.**
>
> **(They belong to the same class as the question whether the good is more or less identical than the beautiful.)**

And it is not surprising that the deepest problems are in fact *not* problems at all.

Philosophers, then, have the task of presenting the logic of our language clearly. This will not solve important problems but it will show that some things that we take to be important problems are really not problems at all. The gain is not wisdom but an absence of confusion. This is not a rejection of philosophy or logic. Wittgenstein took philosophical puzzlement very seriously indeed, but he thought that it needed *dissolving* by analysis rather than *solving* by the production of theories. The *Tractatus* presents itself as a key for untying a series of knots both profound and highly technical.

ETHICS AND RELIGION. Wittgenstein had a lifelong interest in religion and claimed to see every problem from a religious point of view, but never committed himself to any formal religion. His various remarks on ethics also suggest a particular point of view, and Wittgenstein often spoke of ethics and religion together. This point of view or attitude can be seen in the four main themes that run through Wittgenstein's writings on ethics and religion: goodness, value or meaning are not to be found in the world; living the right way involves acceptance of or agreement with the world, or life, or God's will, or fate; one who lives this way will see the world as a miracle; there is no answer to the problem of life--the solution is the disappearance of the problem.

Certainly Wittgenstein worried about being morally good or even perfect, and he had great respect for sincere religious conviction, but he also said, in his 1929 lecture on ethics, that "the tendency of all men who ever tried to write or talk Ethics or Religion was to run against the boundaries of language," i.e. to talk or write nonsense. This gives support to the view that Wittgenstein believed in mystical truths that somehow cannot be expressed meaningfully but that are of the utmost importance. It is hard to conceive, though, what these 'truths' might be.

An alternative view is that Wittgenstein believed that there is really nothing to say about ethics. This would explain why he wrote less and less about ethics as his life wore on. His "accept and endure" attitude and belief in going "the bloody hard way" are evident in all his work, especially after the *Tractatus*. Wittgenstein wants his reader not to think (too much) but to look at the "language games" (any practices that involve language) that give rise to philosophical (personal, existential, spiritual) problems. His approach to such problems is painstaking, thorough, open-eyed and receptive. His ethical attitude is an integral part of his method and shows itself as such.

But there is little to say about such an attitude short of recommending it. In *Culture and Value* p.29e Wittgenstein writes:

> **Rules of life are dressed up in pictures. And these pictures can only serve to *describe* what we are to do, not *justify* it. Because they could provide a justification only if they held good in other respects as well. I can say: "Thank these bees for their honey as though they were kind people who have prepared it for you"; that is *intelligible* and describes how I should like you to conduct yourself. But I cannot say: "Thank them because, look, how kind they are!"--since the next moment they may sting you.**

In a world of contingency one cannot prove that a particular attitude is the correct one to take. If this suggests relativism, it should be remembered that it too is just one more attitude or point of view, and one without the rich tradition and accumulated wisdom, philosophical reasoning and personal experience of, say, orthodox Christianity or Judaism. Indeed crude relativism, the universal judgement that one cannot make universal judgements, is self- contradictory. Whether Wittgenstein's views suggest a more sophisticated form of relativism is another matter, but the spirit of relativism seems far from Wittgenstein's conservatism and absolute intolerance of his own moral shortcomings. Compare the tolerance that motivates relativism with Wittgenstein's assertion to Russell that he would prefer "by far" an organization dedicated to war and slavery to one dedicated to peace and freedom. (This assertion, however, should not be taken literally: Wittgenstein was no war-monger and even recommended letting oneself be massacred rather than taking part in hand-to-hand combat. It was apparently the complacency, and perhaps the self-righteousness, of Russell's liberal cause that Wittgenstein objected to.)

With regard to religion, Wittgenstein is often considered a kind of Anti-Realist (see below for more on this). He opposed interpretations of religion that emphasize doctrine or philosophical arguments intended to prove God's existence, but was greatly drawn to religious rituals and symbols, and considered becoming a priest. He likened the ritual of religion to a great gesture, as when one kisses a photograph. This is not based on the false belief that the person in the photograph will feel the kiss or return it, nor is it based on any other belief. Neither is the kiss just a substitute for a particular phrase, like "I love you." Like the kiss, religious activity does express an attitude, but it is not just the expression of an attitude in the sense that several other forms of expression might do just as well. There might be no substitute that would do. The same might be said of the whole language-game (or games) of religion, but this is a controversial point. If religious utterances, such as "God exists," are treated as gestures of a certain kind then this seems not to be treating them as literal statements. Many religious believers, including Wittgensteinian ones, would object strongly to this. There is room, though, for a good deal of sophisticated disagreement about what it means to take a statement literally. For instance, Charles Taylor's view, roughly, is that the real is whatever will not go away. If we cannot reduce talk about God to anything else, or replace it, or prove it false, then perhaps God is as real as anything else.

CONCEPTION OF PHILOSOPHY. Wittgenstein's view of what philosophy is, or should be, changed little over his life. In the *Tractatus* he says at 4.111 that "philosophy is not one of the natural sciences," and at 4.112 "Philosophy aims at the logical clarification of thoughts." Philosophy is not descriptive but elucidatory. Its aim is to clear up muddle and confusion. It follows that philosophers should not concern themselves so much with what is actual, keeping up with the latest popularizations of science, say, which Wittgenstein despised. The philosopher's proper concern is with what is possible, or rather with what is conceivable. This depends on our concepts and the ways they fit together as seen in language. What is conceivable and what is not,

what makes sense and what does not, depends on the rules of language, of grammar.

In *Philosophical Investigations* Sect. 90 Wittgenstein says:

Our investigation is a grammatical one. Such an investigation sheds light on our problem by clearing misunderstandings away. Misunderstandings concerning the use of words, caused, among other things, by certain analogies between the forms of expression in different regions of language.

The similarities between the sentences "I'll keep it in mind" and "I'll keep it in this box," for instance, (along with many others) can lead one to think of the mind as a thing something like a box with contents of its own. The nature of this box and its mental contents can then seem very mysterious. Wittgenstein suggests that one way, at least, to deal with such mysteries is to recall the different things one says about minds, memories, thoughts and so on, in a variety of contexts.

What one says, or what people in general say, can change. Ways of life and uses of language change, so meanings change, but not utterly and instantaneously. Things shift and evolve, but rarely if ever so drastically that we lose all grip on meaning. So there is no timeless essence of at least some and perhaps all concepts, but we still understand one another well enough most of the time.

When nonsense is spoken or written, or when something just seems fishy, we can sniff it out. The road out of confusion can be a long and difficult one, hence the need for constant attention to detail and particular examples rather than generalizations, which tend to be vague and therefore potentially misleading. The slower the route, the surer the safety at the end of it. That is why Wittgenstein said that in philosophy the winner is the one who finishes last. But we cannot escape language or the confusions to which it gives rise, except by dying. In the meantime, Wittgenstein offers four main methods to avoid philosophical confusion, as described by Norman Malcolm: describing circumstances in which a seemingly problematic expression might actually be used in everyday life, comparing our use of words with imaginary language games, imagining fictitious natural history, and explaining psychologically the temptation to use a certain expression inappropriately.

The complex, intertwined relationship between a language and the form of life that goes with it means that problems arising from language cannot just be set aside--they infect our lives, making us live in confusion. We might find our way back to the right path, but there is no guarantee that we will never again stray. In this sense there can be no progress in philosophy.

In 1931 Wittgenstein described his task thus:

> **Language sets everyone the same traps; it is an immense network of easily accessible wrong turnings. And so we watch one man after another walking down the same paths and we know in advance where he will branch off, where walk straight on without noticing the side turning, etc. etc. What I have to do then is erect signposts at all the junctions where there are wrong turnings so as to help people past the danger points.**

But such signposts are all that philosophy can offer and there is no certainty that they will be noticed or followed correctly. And we should remember that a signpost belongs in the context of a particular problem area. It might be no help at all elsewhere, and should not be treated as dogma. So philosophy offers no truths, no theories, nothing exciting, but mainly reminders of what we all know. This is not a glamorous role, but it is difficult and important. It requires an almost infinite capacity for taking pains (which is one definition of genius) and could have enormous implications for anyone who is drawn to philosophical contemplation or who is misled by bad philosophical

theories. This applies not only to professional philosophers but to any people who stray into philosophical confusion, perhaps not even realizing that their problems are philosophical and not, say, scientific.

MEANING. Sect. 43 of Wittgenstein's *Philosophical Investigations* says that: "For a *large* class of cases--though not for all--in which we employ the word "meaning" it can be defined thus: the meaning of a word is its use in the language."

It is quite clear that here Wittgenstein is *not* offering the general theory that "meaning is use," as he is sometimes interpreted as doing. The main rival views that Wittgenstein warns against are that the meaning of a word is some object that it names--in which case the meaning of a word could be destroyed, stolen or locked away, which is nonsense--and that the meaning of a word is some psychological feeling--in which case each user of a word could mean something different by it, having a different feeling, and communication would be difficult if not impossible.

Knowing the meaning of a word can involve knowing many things: to what objects the word refers (if any), whether it is slang or not, what part of speech it is, whether it carries overtones, and if so what kind they are, and so on. To know all this, or to know enough to get by, is to know the use. And generally knowing the use means knowing the meaning. Philosophical questions about consciousness, for example, then, should be responded to by looking at the various uses we make of the word "consciousness." Scientific investigations into the brain are not directly relevant to this inquiry (although they might be indirectly relevant if scientific discoveries led us to change our use of such words). The meaning of any word is a matter of what we do with our language, not something hidden inside anyone's mind or brain. This is not an attack on neuroscience. It is merely distinguishing philosophy (which is properly concerned with linguistic or conceptual analysis) from science (which is concerned with discovering facts).

One exception to the meaning-is-use rule of thumb is given in Sect.561, where Wittgenstein says that "the word "is" is used with two different meanings (as the copula and as the sign of equality)" but that its meaning is not its use. That is to say, "is" has not one complex use (including both "Water is clear" and "Water is H2O") and therefore one complex meaning, but two quite distinct uses and meanings. It is an accident that the same word has these two uses. It is not an accident that we use the word "car" to refer to both Fords and Hondas. But what is accidental and what is essential to a concept depends on us, on how we use it.

This is not completely arbitrary, however. Depending on one's environment, one's physical needs and desires, one's emotions, one's sensory capacities, and so on, different concepts will be more natural or useful to one. This is why "forms of life" are so important to Wittgenstein. What matters to you depends on how you live (and vice versa), and this shapes your experience. So if a lion could speak, Wittgenstein says, we would not be able to understand it. We might realize that "roar" meant zebra, or that "roar, roar" meant lame zebra, but we would not understand lion ethics, politics, aesthetic taste, religion, humor and such like, if lions have these things. We could not honestly say "I know what you mean" to a lion. Understanding another involves empathy, which requires the kind of similarity that we just do not have with lions, and that many people do not have with other human beings.

When a person says something what he or she means depends not only on what is said but also on the context in which it is said. Importance, point, meaning are given by the surroundings. Words, gestures, expressions come alive, as it were, only within a language game, a culture, a form of life. If a picture, say, means something then it means so *to somebody*. Its meaning is not an objective

property of the picture in the way that its size and shape are. The same goes of any mental picture. Hence Wittgenstein's remark that "If God had looked into our minds he would not have been able to see there whom we were speaking of." Any internal image would need interpretation. If I interpret my thought as one of Hitler and God sees it as Charlie Chaplin, who is right? Which of the two famous contemporaries of Wittgenstein's I mean shows itself in the way I behave, the things I do and say. It is in this that the use, the meaning, of my thought or mental picture lies. "The arrow points only in the application that a living being makes of it."

RULES AND PRIVATE LANGUAGE. Without sharing certain attitudes towards the things around us, sharing a sense of relevance and responding in similar ways, communication would be impossible. It is important, for instance, that nearly all of us agree nearly all the time on what colors things are. Such agreement is part of our concept of color, Wittgenstein suggests. Regularity of the use of such concepts and agreement in their application is part of language, not a logically necessary precondition of it. We cannot separate the life in which there is such agreement from our concept of color. Imagine a different form or way of life and you imagine a different language with different concepts, different rules and a different logic.

This raises the question of the relation between language and forms or ways of life. For instance, could just one person have a language of his or her own? To imagine an individual solitary from birth is scarcely to imagine a form of life at all, but more like just imagining a life- form. Moreover, language involves rules establishing certain linguistic practices. Rules of grammar express the fact that it is our practice to say this (e.g. "half past twelve") and not that (e.g. "half to one"). Agreement is essential to such practices. Could a solitary individual, then, engage in any practice, including linguistic ones? With whom could he or she agree? This is a controversial issue in the interpretation of Wittgenstein. Gordon Baker and P.M.S. Hacker hold that such a solitary man *could* speak his own language, follow his own rules, and so on, agreeing, over time, with himself in his judgements and behavior. Orthodoxy is against this interpretation, however.

Norman Malcolm has written (in an unpublished paper) that "If you conceive of an individual who has been in solitude his whole life long, then you have cut away the background of instruction, correction, acceptance--in short, the circumstances in which a rule is given, enforced, and followed." Mere regularity of behavior does not constitute following rules, whether they be rules of grammar or any other kind. A car that never starts in cold weather does not follow the rule "Don't start when it's cold," nor does a songbird follow a rule in singing the same song every day. Whether a solitary-from-birth individual would ever do anything that we would properly call following a rule is at least highly doubtful. How could he or she give himself or herself a rule to follow without language? And how could he or she get a language? Inventing one would involve inventing meaning, as Rush Rhees has argued, and this sounds incoherent. (The most famous debate about this was between Rhees and A.J. Ayer. Unfortunately for Wittgenstein, Ayer is generally considered to have won.) Alternatively, perhaps the Crusoe-like figure just does behave, sound, etc. just like a native speaker of, say, English. But this is to imagine either a freakish automaton, not a human being, or else a miracle. In the case of a miracle, Wittgenstein says, it is significant that we imagine not just the pseudo- Crusoe but also God. In the case of the automatic speaker, we might adopt what Daniel Dennett calls an "intentional stance" towards him, calling what he does "speaking English," but he is obviously not doing what the rest of us English-speakers--who learned the language, rather than being born speaking it, and who influence and are influenced by others in our use of the language--do.

The debate about solitary individuals is sometimes referred to as the debate about "private

language." Wittgenstein uses this expression in another context, however, to name a language that refers to private sensations. Such a private language by definition cannot be understood by anyone other than its user (who alone knows the sensations to which it refers). Wittgenstein invites us to imagine a man who decides to write 'S' in his diary whenever he has a certain sensation. This sensation has no natural expression, and 'S' cannot be defined in words. The only judge of whether 'S' is used correctly is the inventor of 'S'. The only criterion of correctness is whether a sensation feels the same to him or her. There are no criteria for its *being* the same other than its *seeming* the same. So he writes 'S' when he feels like it. He might as well be doodling. The so-called 'private language' is no language at all. The point of this is not to show that a private language is impossible but to show that certain things one might want to say about language are ultimately incoherent. If we really try to picture a world of private objects (sensations) and inner acts of meaning and so on, we see that what we picture is either regular public language or incomprehensible behavior (the man might as well quack as say or write 'S').

This does not, as has been alleged, make Wittgenstein a behaviorist. He does not deny the existence of sensations or experiences. Pains, tickles, itches, etc. are all part of human life, of course. At *Philosophical Investigations* Sect. 293 Wittgenstein says that "if we construe the grammar of the expression of sensation on the model of 'object and designation' the object drops out of consideration as irrelevant." This suggests not that pains and so on are irrelevant but that we should not construe the grammar of the expression of sensation on the model of 'object and designation'. If we want to understand a concept like pain we should not think of a pain as a private object referred to somehow by the public word "pain." A pain is not "a something," just as love, democracy and strength are not things, but it is no more "a nothing" than they are either (see *Philosophical Investigations* Sect. 304). Saying this is hardly satisfactory, but there is no simple answer to the question "What is pain?" Wittgenstein offers not an answer but a kind of philosophical 'therapy' intended to clear away what can seem so obscure. To judge the value of this therapy, the reader will just have to read Wittgenstein's work for herself.

The best known work on Wittgenstein's writings on this whole topic is Saul A. Kripke's *Wittgenstein on Rules and Private Language*. Kripke is struck by the idea that anything might count as continuing a series or following a rule in the same way. It all depends on how the rule or series is interpreted. And any rule for interpretation will itself be subject to a variety of interpretations, and so on. What counts as following a rule correctly, then, is not determined somehow by the rule itself but by what the relevant linguistic community accepts as following the rule. So whether two plus two equals four depends not on some abstract, extra-human rule of addition, but on what we, and especially the people we appoint as experts, accept. Truth conditions are replaced by assertability conditions. To put it crudely, what counts is not what is true or right (in some sense independent of the community of language users), but what you can get away with or get others to accept.

Kripke's theory is clear and ingenious, and owes a lot to Wittgenstein, but is doubtful as an interpretation of Wittgenstein. Kripke himself presents the argument not as Wittgenstein's, nor as his own, but as "Wittgenstein's argument as it struck Kripke" (Kripke p.5). That the argument is not Wittgenstein's is suggested by the fact that it is a theory, and Wittgenstein rejected philosophical theories, and by the fact that the argument relies heavily on the first sentence of *Philosophical Investigations* Sect. 201: "This was our paradox: no course of action could be determined by a rule, because every course of action can be made out to accord with the rule." For Kripke's theory as a reading of Wittgenstein, it is not good that the very next paragraph begins, "It

can be seen that there is a misunderstanding here..." Still, it is no easy matter to see just where Wittgenstein does diverge from the hybrid person often referred to as 'Kripkenstein'. The key perhaps lies later in the same paragraph, where Wittgenstein writes that "there is a way of grasping a rule which is *not* an *interpretation*". Many scholars, notably Baker and Hacker, have gone to great lengths to explain why Kripke is mistaken. Since Kripke is so much easier to understand, one of the best ways into Wittgenstein's philosophy is to study Kripke and his Wittgensteinian critics. At the very least, Kripke introduces his readers well to issues that were of great concern to Wittgenstein and shows their importance.

REALISM AND ANTI-REALISM. Wittgenstein's place in the debate about philosophical Realism and Anti-Realism is an interesting one. His emphasis on language and human behavior, practices, etc. makes him a prime candidate for Anti-Realism in many people's eyes. He has even been accused of linguistic idealism, the idea that language is the ultimate reality. The laws of physics, say, would by this theory just be laws of language, the rules of the language game of physics. Anti-Realist scepticism of this kind has proved quite popular in the philosophy of science and in theology, as well as more generally in metaphysics and ethics.

On the other hand, there is a school of Wittgensteinian Realism, which is less well known. Wittgenstein's views on religion, for instance, are often compared with those of Simone Weil, who was a Platonist of sorts. Sabina Lovibond argues for a kind of Wittgensteinian Realism in ethics in her *Realism and Imagination in Ethics* and the influence of Wittgenstein is clear in Raimond Gaita's *Good and Evil: An Absolute Conception*. However, one should not go too far with the idea of Wittgensteinian Realism. Lovibond, for instance, equates objectivity with intersubjectivity (universal agreement), so her Realism is of a controversial kind.

Both Realism and Anti-Realism, though, are theories, or schools of theories, and Wittgenstein explicitly rejects the advocacy of theories in philosophy. This does not prove that he practiced what he preached, but it should give us pause. It is also worth noting that supporters of Wittgenstein often claim that he was neither a Realist nor an Anti-Realist, at least with regard to metaphysics. There is something straightforwardly unWittgensteinian about the Realist's belief that language/thought can be compared with reality and found to 'agree' with it. The Anti-Realist says that we could not get outside our thought or language (or form of life or language games) to compare the two. But Wittgenstein was concerned not with what we can or cannot do, but with what makes sense. If metaphysical Realism is incoherent then so is its opposite. The nonsensical utterance "laubgefraub" is not to be contradicted by saying, "No, it is not the case that laubgefraub," or "Laubgefraub is a logical impossibility." If Realism is truly incoherent, as Wittgenstein would say, then so is Anti-Realism.

CERTAINTY. Wittgenstein's last writings were on the subject of certainty. He wrote in response to G.E. Moore's attack on scepticism about the external world. Moore had held up one hand, said "Here is one hand," then held up his other hand and said "and here is another." His point was that things outside the mind really do exist, we know they do, and that no grounds for scepticism could be strong enough to undermine this commonsense knowledge.

Wittgenstein did not defend scepticism, but questioned Moore's claim to know that he had two hands. Such 'knowledge' is not something that one is ever taught, or finds out, or proves. It is more like a background against which we come to know other things. Wittgenstein compares this background to the bed of a river. This river bed provides the support, the context, in which claims to know various things have meaning. The bed itself is not something we can know or doubt. In

normal circumstances no sane person doubts how many hands he or she has. But unusual circumstances can occur and what was part of the river bed can shift and become part of the river. I might, for instance, wake up dazed after a terrible accident and wonder whether my hands, which I cannot feel, are still there or not. This is quite different, though, from Descartes's pretended doubt as to whether he has a body at all. Such radical doubt is really not doubt at all, from Wittgenstein's point of view. And so it cannot be dispelled by a proof that the body exists, as Moore tried to do.

CONTINUITY. Wittgenstein is generally considered to have changed his thinking considerably over his philosophical career. His early work culminated in the *Tractatus Logico-Philosophicus* with its picture theory of language and mysticism, according to this view. Then there came a transitional middle period when he first returned to philosophical work after realizing that he had not solved all the problems of philosophy. This period led to his mature, later period which gave us the *Philosophical Investigations* and *On Certainty*.

There certainly are marked changes in Wittgenstein's work, but the differences between his early and late work can be exaggerated. Two central discontinuities in his work are these: whereas the *Tractatus* is concerned with the general form of the proposition, the general nature of metaphysics, and so on, in his later work Wittgenstein is very critical of "the craving for generality"; and, in the *Tractatus* Wittgenstein speaks of the central problems of philosophy, whereas the later work treats no problems as central. Another obvious difference is in Wittgenstein's style. The *Tractatus* is a carefully constructed set of short propositions. The *Investigations*, though also consisting of numbered sections, is longer, less clearly organized and more rambling, at least in appearance. This reflects Wittgenstein's rejection of the idea that there are just a few central problems in philosophy, and his insistence on paying attention to particular cases, going over the rough ground.

On the other hand, the *Tractatus* itself says that its propositions are nonsense and thus, in a sense (not easy to understand), rejects itself. The fact that the later work also criticizes the *Tractatus* is not, therefore, proof of discontinuity in Wittgenstein's work. The main change may have been one of method and style. Problems are investigated one at a time, although many overlap. There is not a full-frontal assault on *the* problem or problems of philosophy. Otherwise, the *Tractatus* and the *Philosophical Investigations* attack much the same problems; they just do so in different ways.

WITTGENSTEIN IN HISTORY. Wittgenstein's place in the history of philosophy is a peculiar one. His philosophical education was unconventional (going from engineering to working first-hand with one of the greatest philosophers of his day in Bertrand Russell) and he seems never to have felt the need to go back and make a thorough study of the history of philosophy. He was interested in Plato, admired Leibniz, but was most influenced by the work of Schopenhauer, Russell and Frege.

From Schopenhauer (perhaps) Wittgenstein got his interest in solipsism and in the ethical nature of the relation between the will and the world. Schopenhauer's saying that "The world is my idea," (from *The World as Will and Idea*) is echoed in such remarks as "The world is *my* world" (from *Tractatus* 5.62). What Wittgenstein means here, where he also says that what the solipsist means is quite correct, but that it cannot be said, is obscure and controversial. Some have taken him to mean that solipsism is true but for some reason cannot be expressed. H.O. Mounce, in his valuable *Wittgenstein's Tractatus: An Introduction*, says that this interpretation is surely wrong. Mounce's view is that Wittgenstein holds solipsism itself to be a confusion, but one that sometimes arises when one tries to express the fact that "I have a point of view on the world which is without

neighbours." (Mounce p.91) Wittgenstein was not a solipsist but he remained interested in solipsism and related problems of scepticism throughout his life.

Frege was a mathematician as well as a logician. He was interested in questions of truth and falsehood, sense and reference (a distinction he made famous) and in the relation between objects and concepts, propositions and thoughts. But his interest was in logic and mathematics exclusively, not in psychology or ethics. His great contribution to logic was to introduce various mathematical elements into formal logic, including quantification, functions, arguments (in the mathematical sense of something substituted for a variable in a function) and the value of a function. In logic this value, according to Frege, is always either the True or the False, hence the notion of truth-value. Both Frege and Russell wanted to show that mathematics is an extension of logic. Undoubtedly both men influenced Wittgenstein enormously, especially since he worked first-hand with Russell. Some measure of their importance to him can be seen in the preface to the *Tractatus*, where Wittgenstein says that he is "indebted to Frege's great works and to the writings of my friend Mr Bertrand Russell for much of the stimulation of my thoughts." For some insight into whether Frege or Russell had the greater influence one can consider whether one would rather be recognized for his or her great works or for simply being a friend.

In turn Wittgenstein influenced twentieth century philosophy enormously. The Vienna Circle logical positivists were greatly impressed by what they found in the *Tractatus*, especially the idea that logic and mathematics are analytic, the verifiability principle and the idea that philosophy is an activity aimed at clarification, not the discovery of facts. Wittgenstein, though, said that it was what is *not* in the *Tractatus* that matters most.

The other group of philosophers most obviously indebted to Wittgenstein is the ordinary language or Oxford school of thought. These thinkers were more interested in Wittgenstein's later work and its attention to grammar.

Wittgenstein is thus a doubly key figure in the development and history of analytic philosophy, but he has become rather unfashionable because of his anti-theoretical, anti- scientism stance, because of the difficulty of his work, and perhaps also because he has been little understood. Similarities between Wittgenstein's work and that of Derrida are now generating interest among continental philosophers, and Wittgenstein may yet prove to be a driving force behind the emerging post-analytic school of philosophy.

BIBLIOGRAPHY. A full bibliographical guide to works by and on Wittgenstein would fill a whole book, namely *Wittgenstein: A Bibliographical Guide* by Guido Frongia and Brian McGuinness (Basil Blackwell, Oxford 1990). Obviously this is already out of date. Instead of a complete guide, therefore, what follows is a list of some of Wittgenstein's main works, some of the best secondary material on his work, and a few other works chosen for their accessibility and entertainment value, for want of a better expression.

Wittgenstein's main works are these:

- ***Tractatus Logico-Philosophicus*, translated by D.F. Pears and B.F. McGuinness (Routledge and Kegan Paul, London 1961). His early classic.**
- ***The Blue and Brown Books*, (Basil Blackwell, Oxford 1969). From his middle period, these are preliminary studies for his later work.**
- ***Philosophical Investigations*, translated by G.E.M. Anscombe (Basil Blackwell, Oxford 1963). His late classic.**

- *On Certainty*, edited by G.E.M. Anscombe and G.H. von Wright, translated by Denis Paul and G.E.M. Anscombe (Basil Blackwell, Oxford 1979). Like many of Wittgenstein's works, this was compiled after his death from notes he had made. In this case the notes come from the last year and a half of his life.

Works of more general interest by Wittgenstein include these:

- *Culture and Value*, translated by Peter Winch (Basil Blackwell, Oxford 1980). These are notes from throughout Wittgenstein's life dealing with all kinds of topics hinted at by its title, including music, literature, philosophy, religion and the value of silliness.
- *Lectures and Conversations on Aesthetics, Psychology and Religious Belief*, edited by Cyril Barrett (Basil Blackwell, Oxford 1966). For 'psychology' read 'Freud', otherwise the title is explanation enough. Hilary Putnam has recommended the section on religion as a valuable introduction to Wittgenstein's philosophy as a whole.

The best biographies of Wittgenstein are:

- Ray Monk *Ludwig Wittgenstein: The Duty of Genius* (Jonathan Cape, London 1990), which is full of enlightening detail.
- Norman Malcolm *Ludwig Wittgenstein: A Memoir* (Oxford University Press, Oxford and New York 1984), which is much shorter and includes material from G.H. von Wright as well.

Two of the best books on the *Tractatus* are:

- G.E.M. Anscombe *An Introduction to Wittgenstein's Tractatus* (University of Pennsylvania Press, Philadelphia 1971), which emphasizes the importance of Frege and is notoriously difficult
- H.O. Mounce *Wittgenstein's Tractatus: An Introduction* (Basil Blackwell, Oxford 1981), which is lighter but more reader-friendly.

A good rule of thumb for picking secondary material on Wittgenstein is to trust Wittgenstein's own judgement. He chose G.E.M. Anscombe, Rush Rhees and G.H. von Wright to understand and deal with his unpublished writings after his death. Anything by one of these people should be fairly reliable. More contentiously, I would say that the best people writing on Wittgenstein today are James Conant, Cora Diamond and Peter Winch. Other books referred to in the text above or of special note are these:

- O.K. Bouwsma *Wittgenstein: Conversations 1949-1951*, edited by J.L. Craft and Ronald E. Hustwit (Hackett, Indianapolis 1986). A seemingly little read slim volume that includes records of Wittgenstein's comments on such diverse and interesting topics as Descartes, utilitarianism and the word 'cheeseburger'.
- Stanley Cavell *The Claim of Reason: Wittgenstein, Skepticism, Morality, and Tragedy* (Oxford University Press, Oxford and New York 1979). A long, rich, challenging classic.
- Cora Diamond *The Realistic Spirit: Wittgenstein, Philosophy, and the Mind* (MIT, Cambridge, Massachusetts 1991). A collection of essays of varying degrees of accessibility on Frege, Wittgenstein and ethics, united by their Wittgensteinian spirit.
- M.O'C. Drury *The Danger of Words* (Thoemmes Press, Bristol, U.K. and Washington, D.C. 1996). A classic, including discussions of issues in psychiatry and religion by a

friend of Wittgenstein's.

- Paul Engelmann *Letters from Wittgenstein with a memoir* (Basil Blackwell, Oxford 1967). Includes discussions by Wittgenstein and his friend Engelmann on the *Tractatus*, religion, literature and culture.
- Saul A. Kripke *Wittgenstein on Rules and Private Language* (Harvard University Press, Cambridge, Massachusetts 1982). See the section on rules and private language above.
- Norman Malcolm *Wittgenstein: Nothing is Hidden* (Basil Blackwell, Oxford 1986). One of the best accounts of Wittgenstein's philosophy from the disreputable point of view that the *Tractatus* advanced theses which are then attacked in the later work.
- Norman Malcolm *Wittgenstein: A Religious Point of View?*, edited with a response by Peter Winch (Cornell University Press, Ithaca, New York 1994). Malcolm basically summarizes Wittgenstein's philosophy, as he understands it, with a special emphasis on religion. Winch then responds, correcting Malcolm's account where necessary. The result is a highly accessible composite overview of Wittgenstein's work from the religious point of view, which is how Wittgenstein himself said that he saw every problem.

Xenophanes (570-475 BCE.)

Founder of the Eleatic school of philosophy, Xenophanes was a native of Colophon, and born about 570 BCE. It is difficult to determine the dates of his life with any accuracy and the facts of his life are also obscure. Xenophanes early left his own country and took refuge in Sicily, where he supported himself by reciting, at the court of Hiero, elegiac and iambic verses, which he had written in criticism of the *Theogony* of Hesiod and Homer. From Sicily he passed over into Magna Graecia, where he took up the profession of philosophy, and became a celebrated teacher in the Pythagorean school. Give way to a greater freedom of thought than was usual among the disciples of Pythagoras, he introduced new opinions of his own opposing the doctrines of Epimenides, Thales, and Pythagoras. He held the Pythagorean chair of philosophy for about seventy years, and lived to the extreme age of 105.

Xenophanes was an elegiac and satirical poet who approached the question of science from the standpoint of the reformer rather than of the scientific investigator. If we look at the very considerable remains of his poetry that have come down to us, we see that they are all in the satirist's and social reformer's vein. There is one dealing with the management of a feast, another which denounces the exaggerated importance attached to athletic victories, and several which attack the humanized gods of Homer. The problem is, therefore, to find, if we can, a single point of view from which all these fragments can be interpreted, although it may be that no such point of view exists. Like the religious reformers of the day, Xenophanes turned his back on the anthropomorphic polytheism of Homer and Hesiod. This revolt is based on a conviction that the tales of the poets are directly responsible for the moral corruption of the time. 'Homer and Hesiod have ascribed to the gods all things that are a shame and a disgrace among mortals, stealing and adulteries and deceiving of another' (fr. 11). And this he held was due to the representation of the gods in human form. Men make gods in their own image; those of the Ethiopians are black and snub-nosed, those of the Thracians have blue eyes and red hair (fr 16). If horses or oxen or lions had hands and could produce works of art, they too would represent the gods after their own fashion (fr. 15). All that must be swept away along with the tales of Titans and Giants, those 'figments of an earlier day' (fr. 1) if social life is to be reformed.

Xenophanes found the weapons he required for his attack on polytheism in the science of the time. Here are traces of Anaximander's cosmology in the fragments, and Xenophanes may easily have been his disciple before he left Ionia. He seems to have taken the gods of mythology one by one and reduced them to meteorological phenomena, and especially to clouds. And he maintained there was only one god -- namely, the world. God is one incorporeal eternal being, and, like the universe, spherical in form; that he is of the same nature with the universe, comprehending all things within himself; is intelligent, and pervades all things, but bears no resemblance to human nature either in body or mind.

He taught that if there had ever been a time when nothing existed, nothing could *ever* have existed.

Whatever is, always has been from eternity, without deriving its existence from any prior principles. Nature, he believed, is one and without limit; that what is one is similar in all its parts, else it would be many; that the one infinite, eternal, and homogeneous universe is immutable and incapable of change. His position is often classified as pantheistic, although his use of the term 'god' simply follows the use characteristic of the early cosmologists generally. There is no evidence that Xenophanes regarded this 'god' with any religious feeling, and all we are told about him (or rather about it) is purely negative. He is quite unlike a man, and has no special organs of sense, but 'sees all over, thinks all over, hears all over' (fr. 24). Further, he does not go about from place to place (fr. 26), but does everything 'without toil (fr. 25). It is not safe to go beyond this; for Xenophanes himself tells us no more. It is pretty certain that if he had said anything more positive or more definitely religious in its bearing it would have been quoted by later writers.

Xenophon (444-357)

Life. An Athenian, the son of Gryllus, Xenophon was born about 444 BCE. In his early life he was a pupil of Socrates; but the turning point in his career came when he decided to serve in the Greek contingent raised by Cyrus against Artaxerxes in 401. Xenophon himself mentions the circumstances under which he joined this army (*Anab*. 3:1). Proxenus, a friend of Xenophon, was already with Cyrus, and he invited Xenophon to come to Sardis, and promised to introduce him to the Persian prince. He accompanied Cyrus into Upper Asia. In the battle of Cunaxa (401 BCE.) Cyrus lost his life, his barbarian troops were dispersed, and the Greeks were left alone on the wide plains between the Tigris and the Euphrates. It was after the treacherous massacre of Clearchus and others of the Greek commanders by the Persian satrap Tissaphernes that Xenophon came forward. He had held no command in the army of Cyrus, nor had he, in fact, served as a soldier, yet he was elected one of the generals, and took the principal part in conducting the Greeks in their memorable retreat along the Tigris over the high table-lands of Armenia to Trapezus (Trebizond) on the Black Sea. From Trapezus the troops were conducted to Chrysopolis, which is opposite to Byzantium. The Greeks were in great distress, and some of them under Xenophon entered the service of Seuthes, king of Thrace. As the Lacedaemonians under Thimbrou (or Thibron) were now at war with Tissaphernes and Pharnabazus, Xenophon and his troops were invited to join the army of Thimbron, and Xenophon led them back out of Asia to join Thimbron (399). Xenophon, who was very poor, mad an expedition into the plain of the Caicus with his troops before they joined Thimbrou, to plunder the house and property of a Persian named Asidates. The Persian, with his women, children, and all his movables, was seized, and Xenophon, by this robbery, replenished his empty pockets (*Anab.* 7:8, 23). He tells the story himself, and is evidently not ashamed of it.

In other ways also he showed himself the prototype of an adventurous leader of *condottieri*, with no ties of country or preference of nationality. He formed a scheme for establishing a town with the Ten Thousand on the shores of the Euxine; but it fell through. He joined the Spartans, as has been seen, and he continued in their service even when they were at war with Athens. Agesilaus, the Spartan, was commanding the Lacedaemonian forces in Asia against the Persians in 396, and Xenophon was with him at least during part of the campaign. When Agesilaus was recalled (394), Xenophon accompanied him, and he was on the side of the Lacedaemonians in the battle which they fought at Coronea (394) against the Athenians. As a natural consequence a decree of exile was passed against him at Athens. It seems that he went to Sparta with Agesilaus after the battle of Coronea, and soon after he settled at Scillus in Elis, not far from Olympia, a spot of which he has given a description in the *Anabasis*. Here he was joined by his wife, Philesia, and his children. His children were educated in Sparta.

Xenophon was now a Lacedaemonian so far as he could become one. His time during his long residence at Scillus was employed in hunting, writing, and entertaining his friends; and perhaps the *Anabasis* and part of the *Hellenica* were composed here. The treatise on hunting and that on

the horse were probably also written during this time, when amusement and exercise of this kind formed part of his occupation. On the downfall of the Spartan supremacy, at Leuctra in 371, Xenophon was at last expelled from his quite retreat at Scillus by the Elans, after remaining there about twenty years. The sentence of banishment from Athens was repealed on the motion of Eubulus, but it is uncertain in what year. There is no evidence that Xenophon ever returned to Athens. He is said to have retired to Corinth after his expulsion from Scillus, and as we know nothing more, we assume that he died there some time around 357.

Writings. The following is a list of Xenophon's works. (1) The *Anabasis,* a history of the expedition of the Younger Cyrus, and of the retreat of the Greeks who formed part of his army. It is divided into seven books. As regards the title, it will be noticed that under the name "The March Up" (*ana,* i.e., inland from the coast of Cunaxa) is included also the much longer account of the return march *down* to the Euxine. This work has immortalized Xenophon. It was the first work which made the Greeks acquainted with some portions of the Persian Empire, and it showed the weakness of that extensive monarchy. The skirmishes of the retreating Greeks with their enemies, and the battles with some of the barbarian tribes, are not such events as elevate the work to the character of a military history. (2) The *Hellenica* is divided into seven books, and covers the forty-eight years from the time when the History of Thucydides ends to the battle of Mantinea. (3) The *Cyropadia,* in eight books, is a kind of political romance, the basis of which is the history of the Elder Cyrus, the founder of the Persian monarchy. The *Agesilaus* is a panegyric on Agesilaus II, king of Sparta, the friend of Xenophon. (5) The *Hipparchicus* is a treatise on the duties of a commander of cavalry, containing military precepts. (6) *De Re Equestri* is a treatise on the horse; it is not limited to horsemanship, but also shows how to avoid being cheated in buying a horse, and how to train a horse. (7) The *Cynegeticus* is a treatise on hunting, and on the breading and training of hunting dogs. (8) The *Respublica Lacedaemoniorum* is a treatise on the Spartan states, and (9) the *Atheniensium* on the Athenian States. (10) The *De Vectigalibus,* a treatise on the revenues of Athens, is designed to show how the public revenue of Athens may be improved. (11) The *Memorabilia of Socrates,* in four books, was written by Xenophon to defend the memory of his master against the charge of irreligion and of corrupting the Athenian youth. Socrates is represented as holding a series of conversations, in which he develops and inculcates his moral doctrines. It is entirely a practical work such as we might expect from the practical nature of Xenophon, and it

professes to show Socrates as he taught. (12) The *Apology of Socrates* is a short speech, containing the reasons which induced Socrates to prefer death to life. (13) The *Symposium*, or Banquet of Philosophers, delineates the character of Socrates. The speakers are supposed to meet at the house of Callias, a rich Athenian, at the celebration of the Great Panathenaea. Socrates and others are the speakers. It is possible that Plato wrote his *Symposium* later, to some extent as a corrective. (14) The *Hiero* is a dialogue between King Hiero and Simonides, in which the king speaks of the dangers and difficulties incident to an exalted station, and the superior happiness of a private man. The poet, on the other hand, enumerates the advantages which the possession of power gives, and the means which it offers of obliging and doing services. (15) The *Oeconomicus* ("The Complete Householder") is a treatise in the form of a dialogue between Socrates and Critobulus, in which Socrates gives instruction in the administration of a household and property.

Xenophon's Account of Socrates. Four of Xenophon's works listed above purport to record actual conversations of Socrates, whom he had known as a young man. In the *Anabasis*, Xenophon consulted on his decision to join Cyrus. Socrates, advised him to consult the oracle of Delphi, as it was a hazardous matter for him to enter the service of Cyrus, who was considered to be the friend of the Lacedaemonians and the enemy of Athens. Xenophon went to Delphi, but he did not ask the god whether he should go or not; he probably had made up his mind. He merely inquired to what gods he should sacrifice so that he might be successful in his intended enterprise. Socrates was not satisfied with his pupil's mode of consulting the oracle; but as he had got an answer, he told him to go. He tells us frankly that Socrates rebuked him for this evasion, and that is all we know of their discussion. If there had been more to tell, Xenophon would have told it, for he was not averse to talking about himself. At this time Xenophon was under thirty, and Socrates had passed away before his return from Asia. Several of the Socratic conversations he records are on subjects we know Xenophon was specially interested in, and the views he offers in them are just those he elsewhere expresses in his own name or through the mouth of Cyrus in the *Cyropadia*. Accordingly, no one appeals to such works as *Oeconomicus* for evidence regarding the historical Socrates. His *Apology* and *Symposium* are similarly disregarded as sources of information on Socrates.

Since the eighteenth century, however, it has been customary to make an exception in favor of a single work, the *Memorabilia*, composed by the exiled Xenophon with the professed intention of showing that Socrates was not irreligious, and that, so far from corrupting the young, he did them a great deal of good by his conversations. It makes sense that the eighteenth-century should have preferred the Socrates of the *Memorabilia* to that of the Platonic dialogues, for he comes nearer to their idea of what a philosopher ought to be. In other respects it is hard to see what there is to recommend Xenophon. It is recognized that he is far from being a trustworthy historian, and the *Cyropaedia* shows his turn for philosophical romance. It is methodologically unsound to isolate the *Memorabilia* from Xenophon's other Socratic writings, unless there are strong reasons to do so. Thus, since it is impossible to get anything like a complete picture of Socrates from the *Memorabilia* alone, Xenophon supporters fill their outline with Plato's account.

Nevertheless, one of the *Memorabilia*'s chief arguments for the soundness of Socrates' religious attitude is that he refused to busy himself with natural science and dissuaded others from studying it. What Plato tells us of the disappointment of Socrates with Anaxagoras, and his renunciation of physical speculations at an early age is enough to explain Xenophon's contention. Xenophon continues, though, maintaining that Socrates was not unversed in mathematical and astronomical subjects. Further, he know that what Aristophanes burlesqued in the *Clouds* was true, since Xenophon makes Socrates tell he Sophist Antophon, who was trying to rob him of his disciples, that he dies in fact study the writings of the older philosophers "unrolling the treasures... which they have written down in books and left behind them" (*Mem* 1:6:14). Admissions like these are more important than the words put into Socrates' mouth denying scientific study. It would be possible to find other admissions of this sort in Xenophon, but it is not clear how far the *Memorabilia* can be regarded as independent testimony at all. In fact, it is likely that Xenophon relied on Plato's dialogues for his information about Socrates. Otherwise, it would be significant that he has heard of the importance of "hypothesis" in Socrates' dialectic system.

- Zeno of Elea

The Internet Encyclopedia of Philosophy

Zeno of Elea (b. 488 BCE.)

Zeno was an Eleatic philosopher, a native of Elea (Velia) in Italy, son of Teleutagoras, and the favorite disciple of Parmenides. He was born about 488 BCE., and at the age of forty accompanied Parmenides to Athens. He appears to have resided some time at Athens, and is said to have unfolded his doctrines to people like Pericles and Callias for the price of 100 minae. Zeno is said to have taken part in the legislation of Parmenides, to the maintenance of which the citizens of Elea had pledged themselves every year by oath. His love of freedom is shown by the courage with which he exposed his life in order to deliver his native country from a tyrant. Whether he died in the attempt or survived the fall of the tyrant is a point on which the authorities vary. They also state the name of the tyranny differently. Zeno devoted all his energies to explain and develop the philosophical system of Parmenides. We learn from Plato that Zeno was twenty-five years younger than Parmenides, and he wrote his defense of Parmenides as a young man. Because only a few fragments of Zeno's writings have been found, most of what we know of Zeno comes from what Aristotle said about him in *Physics*, Book 6, chapter 9.

Zeno's contribution to Eleatic philosophy is entirely negative. He did not add anything positive to the teachings of Parmenides, but devoted himself to refuting the views of the opponents of Parmenides. Parmenides had taught that the world of sense is an illusion because it consists of motion (or change) and plurality (or multiplicity or the many). True Being is absolutely one; there is in it no plurality. True Being is absolutely static and unchangeable. Common sense says there is both motion and plurality. This is the Pythagorean notion of reality against which Zeno directed his arguments. Zeno showed that the common sense notion of reality leads to consequences at least as paradoxical as his master's.

Paradoxes of Multiplicity and Motion.

Zeno's arguments can be classified into two groups. The first group contains paradoxes against multiplicity, and are directed to showing that the 'unlimited' or the continuous, cannot be composed of units however small and however many. There are two principal arguments:

1. **If we assume that a line segment is composed of a multiplicity of points, then we can always bisect a line segment, and every bisection leaves us with a line segment that can itself be bisected. Continuing with the bisection process, we never come to a point, a stopping place, so a line cannot be composed of points.**

2. **The many, the line, must be both limited and unlimited in number of points. It must be limited because it is just as many (points) as it is, no more, and less. It is therefore, a definite number, and a definite number is a finite or limited number. However, the many must also be unlimited in number, for it is infinitely divisible. Therefore, it's contradictory to suppose a line is composed of a multiplicity of points.**

The second group of Zeno's arguments concern motion. They introduce the element of time, and are directed to showing that time is no more a sum of moments than a line is a sum of points. There are four of these arguments:

1. **If a thing moves from one point in space to another, it must first traverse half the distance. Before it can do that, it must traverse a half of the half, and so on ad infinitum. It must, therefore, pass through an infinite number of points, and that is impossible in a finite time.**

2. **In a race in which the tortoise has a head start, the swifter-running Achilles can never overtake the tortoise. Before he comes up to the point at which the tortoise started, the tortoise will have got a little way, and so on ad infinitum.**

3. **The flying arrow is at rest. At any given moment it is in a space equal to its own length, and therefore is at rest at that moment. So, it's at rest at all moments. The sum of an infinite number of these positions of rest is not a motion.**

4. **Suppose there are three arrows. Arrow B is at rest. Suppose A moves to the right past B, and C moves to the left past B, at the same rate. Then A will move past C at twice the rate. This doubling would be contradictory if we were to assume that time and space are atomistic. To see the contradiction, consider this position as the chains of atoms pass each other:**
   A1 A2 A3 ==>
   B1 B2 B3
   C1 C2 C3 <==
   Atom A1 is now lined up with C1, but an instant ago A3 was lined up with C1, and A1 was still two positions from C1. In that one unit of time, A2 must have passed C1 and lined up with C2. How did A2 have time for two different events (namely, passing C1 and lining up with C2) if it had only one unit of time available? It takes time to have an event, doesn't it?

   Both groups of Zeno's arguments, those against multiplicity and those against motion, are variations of one argument that applies equally to space or time. For simplicity, we will consider it only in its spatial sense. Any quantity of space, say the space enclosed within a circle, must either be composed of ultimate indivisible units, or it must be divisible *ad infinitum*. If it is composed of indivisible units, these must have magnitude, and we are faced with the contradiction of a magnitude which cannot be divided. If it is divisible *ad infinitum*, we are faced with the contradiction of supposing that an infinite number of parts can be

added up to make a merely finite sum.

Zeno's point is that since multiplicity and motion contain these contradictions, they cannot be real. Therefore, as Parmenides said, there is only one Being, with no multiplicity in it, and it excludes all motion and change.

Kant's, Hume's, and Hegel's Solutions to Zeno's Paradoxes. According to Kant, these contradictions are immanent in our conceptions of space and time, so space and time are not real. Space and time do not belong to things as they are in themselves, but rather to our way of looking at things. They are forms of our perception. It is our minds which impose space and time upon objects, and not objects which impose space and time upon our minds. Further, Kant drew from these contradictions the conclusion that to comprehend the infinite is beyond the capacity of human reason. He attempted to show that, wherever we try to think the infinite, whether the infinitely large or the infinitely small, we fall into irreconcilable contradictions.

As might be expected, many thinkers have looked for a way out of the paradoxes. Hume denied the infinite divisibility of space and time, and declared that they are composed of indivisible units having magnitude. But the difficulty that it is impossible to conceive of units having magnitude which are yet indivisible is not satisfactorily explained by Hume.

Hegel believed that any solution which is to be satisfactory must somehow make room for both sides of the contradiction. It will not do to deny one side or the other, to say that one is false and the other true. A true solution is only possible by rising above the level of the two antagonistic principles and taking them both up to the level of a higher conception, in which both opposites are reconciled. Hegel regarded Zeno's paradoxes as examples of the essential contradictory character of reason. All thought, all reason, for Hegel, contains immanent

contradictions which it first posits and then reconciles in a higher unity, and this particular contradiction of infinite divisibility is reconciled in the higher notion of *quantity*. The notion of quantity contains two factors, namely the *one* and the *many*. Quantity means precisely a many in one, or a one in many. If, for example, we consider a quantity of anything, say a heap of wheat, this is, in the first place, one; it is one whole. Secondly, it is many, for it is composed of many parts. As one it is continuous; as many it is discrete. Now the true notion of quantity is not one, apart form many, nor many apart from one. It is the synthesis of both. It is a many *in* one. The antinomy we are considering arises from considering one side of the truth in a false abstraction from the other. To conceive unity as not being in itself multiplicity, or multiplicity as not being unity, is a false abstraction. The thought of the one involves the thought of the many, and the thought of the many involves the thought of the one. You cannot have a many without a one, any more than you can have one end of a stick without the other.

Now, if we consider anything which is quantitatively measured, such as a straight line, we may consider it, in the first place, as one. In that case it is a continuous divisible unit. Next we may regard it as many, in which case it falls into parts. Now each of these parts may again be regarded as one, and as such is an indivisible unit; and again each part may be regarded as many, in which case it falls into further parts; and this alternating process may go on for ever. This is the view of the matter which gives rise to Zeno's contradictions. But it is a false view. It involves the false abstraction of first regarding the many as something that has reality apart from the one, and then regarding the one as something that has reality apart from the many. If you persist in saying that the line is simply one and not many, then there arises the theory of indivisible units. If you persist in saying it is simply many and not one, then it is divisible *ad infinitum*. But the truth is that it is neither simply many nor simply one; it is a many *in* one, that is, it is a *quantity*. Both sides of the contradiction are, therefore, in one sense true, for each is a factor of the truth. But both sides are also false, if and in so far as, each sets itself up as the whole truth.

The Contemporary Solution to Zeno's Paradoxes.

Kant's, Hume's and Hegel's solutions to the paradoxes have been very stimulating to subsequent thinkers, but ultimately have not been accepted. There is now general agreement among mathematicians, physicists and philosophers of science on what revisions are necessary in order to escape the contradictions discovered by Zeno's fruitful paradoxes. The concepts of space, time, and motion have to be radically changed, and so do the mathematical concepts of line, number, measure, and sum of a series. Zeno's integers have to be replaced by the contemporary notion of real numbers. The new one-dimensional continuum, the standard model of the real numbers under their natural (less-than) order, is a radically different line than what Zeno was imagining. The new line is now the basis for the scientist's notion of distance in space and duration through time. The line is no longer a sum of points, as Zeno supposed, but a set-theoretic union of a non-denumerably infinite number of unit sets of points. Only in this way can we make sense of higher dimensional objects such as the one-dimensional line and the two-dimensional plane being composed of zero-dimensional points, for, as Zeno knew, a simple sum of even an infinity of zeros would never total more than zero. The points in a line are so densely packed that no point is next to any other point. Between any two there is a third, all the way 'down.' The infinity of points in the line is much larger than any infinity Zeno could have imagined. The non-denumerable infinity of real numbers (and thus of points in space and of events in time) is much larger than the merely denumerable infinity of integers. Also, the sum of an infinite series of numbers can now have a finite sum, unlike in Zeno's day. With all these changes, mathematicians and scientists can say that all of Zeno's arguments are based on what are now false assumptions and that no Zeno-like paradoxes can be created within modern math and science. Achilles catches his tortoise, the flying arrow moves, and it's possible to go to an infinite number of places in a finite time, without contradiction.

No single person can be credited with having shown how to solve Zeno's paradoxes. There have been essential contributions starting from the calculus of Newton and Leibniz and ending at the beginning of the twentieth century with the mathematical advances of Cauchy, Weierstrass, Dedekind, Cantor, Einstein, and Lebesque. Philosophically, the single greatest contribution was to replace a reliance on what humans can imagine with a reliance on creating logically consistent mathematical concepts that can promote quantitative science.

Karl Robert Eduard Von Hartmann (1842-1906)

German philosopher, born at Berlin Feb. 23, 1842, died at the same place June 5, 1906. He was educated at the school of artillery in Berlin (1859-1862); and held a commission (1860-65), when he was compelled to retire on account of serious knee trouble. He took his degree at Rostock in 1867, returned to Berlin, and retired to Lichterfelde (5 m. s.w. of Berlin) in 1885, doing most of his work in bed while suffering great pain. After developing the thought for twenty-two years, he began in 1864 to prepare his main philosophical work, *Philosophie des Unbewussten* (Berlin, 1869; llth ed., 3 vols., 1904). Next in rank was his *Das sittliche Bewusstsein*, appearing first as *Phenomenologie des sittlichen Bewusstseins* (Berlin, 1879); and next to that was the *Religionsphilosophie* (2 vols., *Das religiose Bewusstein der Menschheit and Die Religion des Geistes*, 1882).

The object of his philosophy was to unite the "idea" of Hegel with the "will" of Schopenhauer in his doctrine of the Absolute Spirit, or, as he preferred to characterize it, spiritual monism. He held that " a will which does not will something is not." The world was produced by will and idea, but not as conscious; for consciousness, instead of being essential, is accidental to will and idea-the two poles of " the Unconscious." Matter is both idea and will. In organic existences, in instinct, in the human mind, on the field of history, the unconscious will acts as though it possessed consciousness, i.e., were aware of the ends and of the infallible means for their realization. Consciousness arises from the temporary diremption of the idea from the active will and the will's opposition to this condition. Because of the wisdom displayed in the action of the Unconscious, this is the best possible world; only this does not prove that the world is good, or that the world would not be better, the latter of which is true. Human life labors under three illusions: (1) that happiness is possible in this life, which came to an end with the Roman Empire; (2) that life will be crowned with happiness in another world, which science is rapidly dissipating; (3) that happy social well-being, although postponed, can at last be realized on earth, a dream which will also ultimately be dissolved. Man's only hope lies in "final redemption from the misery of volition and existence into the painlessness of non-being and non-willing." No mortal may quit the task of life, but each must do his part to hasten the time when in the major portion of the human race the activity of the Unconscious shall be ruled by intelligence, and this stage reached, in the simultaneous action of many persons volition will resolve upon its own non-continuance, and thus idea and will be once more reunited in the Absolute.

Principles of Morals and Legislation

Chapters 1-4

Jeremy Bentham

1781

Chapter I: Of The Principle Of Utility.

I. Nature has placed mankind under the governance of two sovereign masters, *pain* and *pleasure*. It is for them alone to point out what we ought to do, as well as to determine what we shall do. On the one hand the standard of right and wrong, on the other the chain of causes and effects, are fastened to their throne. They govern us in all we do, in all we say, in all we think: every effort we can make to throw off our subjection, will serve but to demonstrate and confirm it. In words a man may pretend to abjure their empire: but in reality he will remain subject to it all the while. The *principle of utility*[2] recognises this subjection, and assumes it for the foundation of that system, the object of which is to rear the fabric of felicity by the hands of reason and of law. Systems which attempt to question it, deal in sounds instead of sense, in caprice instead of reason, in darkness instead of light.

But enough of metaphor and declamation: it is not by such means that moral science is to be improved.

II. The principle of utility is the foundation of the present work: it will be proper therefore at the outset to give an explicit and determinate account of what if; meant by it. By the principle[3]of utility is meant that principle which approves or disapproves of every action whatsoever, according to the tendency which it appears to have to augment or diminish the happiness of the party whose interest is in question: or, what is the same thing in other words, to promote or to oppose that happiness. I say of every action whatsoever; and therefore not, only of every action of a private individual, but of every measure of government.

III. By utility is meant that property in any object, whereby it tends to produce benefit, advantage, pleasure, good, or happiness, (all this in the present case comes to the same thing) or (what comes again to the same thing) to prevent the happening of mischief, pain, evil, or unhappiness to the

party whose interest is considered: if that party be the community in general, then the happiness of the community: if a particular individual, then the happiness of that individual.

IV. The interest of the community is one of the most general expressions that can occur in the phraseology of morals: no wonder that the meaning of it is often lost. When it has meaning, it is this. The community is a fictitious *body*, composed of the individual persons who are considered as constituting as it were its *members*. The interest of the community then is, what? -- the sum of the interests of the several members who compose it.

V. It is in vain to talk of the interest of the community, without understanding what is the interest of the individual.[4] A thing is said to promote the interest, or to be *for* the interest, of an individual, when it tends to add to the sum total of his pleasures: or, what comes to the same thing, to diminish the sum total of his pains.

VI. An action then may be said to be conformable to the principle of utility, or, for shortness sake, to utility, (meaning with respect to the community at large) when the tendency it has to augment the happiness of the community is greater than any it has to diminish it.

VII. A measure of government (which is but a particular kind of action, performed by a particular person or persons) may be said to be conformable to or dictated by the principle of utility, when in like manner the tendency which it has to augment the happiness of the community is greater than any which it has to diminish it.

VIII. When an action, or in particular a measure of government, is supposed by a man to be conformable to the principle of utility, it may be convenient, for the purposes of discourse, to imagine a kind of law or dictate, called a law or dictate of utility: and to speak of the action in question, as being conformable to such law or dictate.

IX. A man may be said to be a partizan of the principle of utility, when the approbation or disapprobation he annexes to any action, or to any measure, is determined by and proportioned to the tendency which he conceives it to have to augment or to diminish the happiness of the community: or in other words, to its conformity or unconformity to the laws or dictates of utility.

X. Of an action that is conformable to the principle of utility one may always say either that it is one that ought to be done, or at least that it is not one that ought not to be done. One may say also, that it is right it should be done; at least that it is not wrong it should be done: that it is a right action; at least that it is not a wrong action. When thus interpreted, the words *ought*, and *right* and *wrong*, and others of that stamp, have a meaning: when otherwise, they have none.

XI. Has the rectitude of this principle been ever formally contested? It should seem that it had, by those who have not known what they have been meaning. Is it susceptible of any direct proof? it should seem not: for that which is used to prove every thing else, cannot itself be proved: a chain of proofs must have their commencement somewhere. To give such proof is as impossible as it is needless.

XII. Not that there is or ever has been that human creature breathing, however stupid or perverse, who has not on many, perhaps on most occasions of his life, deferred to it. By the natural constitution of the human frame, on most occasions of their lives men in general embrace this principle, without thinking of it: if not for the ordering of their own actions, yet for the trying of their own actions, as well as of those of other men. There have been, at the same time, not many, perhaps, even of the most intelligent, who have been disposed to embrace it purely and without reserve. There are even few who have not taken some occasion or other to quarrel with it, either on

account of their not understanding always how to apply it, or on account of some prejudice or other which they were afraid to examine into, or could not bear to part with. For such in the stuff that man is made of: in principle and in practice, in a right track and in a wrong one, the rarest of all human qualities is consistency.

XIII. When a man attempts to combat the principle of utility, it is with reasons drawn, without his being aware of it, from that very principle itself.[5] His arguments, if they prove any thing, prove not that the principle is wrong, but that, according to the applications he supposes to be made of it, it is *misapplied*. Is it possible for a man to move the earth? Yes; but he must first find out another earth to stand upon.

XIV. To disprove the propriety of it by arguments is impossible; but, from the causes that have been mentioned, or from some confused or partial view of it, a man may happen to be disposed not to relish it. Where this is the case, if he thinks the settling of his opinions on such a subject worth the trouble, let him take the following steps, and at length, perhaps, he may come to reconcile himself to it.

1. Let him settle with himself, whether he would wish to discard this principle altogether; if so, let him consider what it is that all his reasonings (in matters of politics especially) can amount to?

2. If he would, let him settle with himself, whether he would judge and act without any principle, or whether there is any other he would judge and act by?

3. If there be, let him examine and satisfy himself whether the principle he thinks he has found is really any separate intelligible principle; or whether it be not a mere principle in words, a kind of phrase, which at bottom expresses neither more nor less than the mere averment of his own unfounded sentiments; that is, what in another person he might be apt to call caprice?

4. If he is inclined to think that his own approbation or disapprobation, annexed to the idea of an act, without any regard to its consequences, is a sufficient foundation for him to judge and act upon, let him ask himself whether his sentiment is to be a standard of right and wrong, with respect to every other man, or whether every man's sentiment has the same privilege of being a standard to itself?

5. In the first case, let him ask himself whether his principle is not despotical, and hostile to all the rest of human race?

6. In the second case, whether it is not anarchial, and whether at this rate there are not as many different standards of right and wrong as there are men? and whether even to the same man, the same thing, which is right to-day, may not (without the least change in its nature) be wrong to-morrow? and whether the same thing is not right and wrong in the same place at the same time? and in either case, whether all argument is not at an end? and whether, when two men have said, 'I like this,' and 'I don't like it,' they can (upon such a principle) have any thing more to say?

7. If he should have said to himself, No: for that the sentiment which he proposes as a standard must be grounded on reflection, let him say on what particulars the reflection is to turn? if on particulars having relation to the utility of the act, then let him say whether this is not deserting his own principle, and borrowing assistance from that very one in opposition to which he sets it up: or if not on those particulars, on what other particulars?

8. If he should be for compounding the matter, and adopting his own principle in part, and the principle of utility in part, let him say how far he will adopt it?

9. When he has settled with himself where he will stop, then let him ask himself how he justifies to

himself the adopting it so far? and why he will not adopt it any farther?

10. Admitting any other principle than the principle of utility to be a right principle, a principle that it is right for a man to pursue; admitting (what is not true) that the word *right* can have a meaning without reference to utility, let him say whether there is any such thing as a *motive* that a man can have to pursue the dictates of it: if there is, let him say what that motive is, and how it is to be distinguished from those which enforce the dictates of utility: if not, then lastly let him say what it is this other principle can be good for?

Chapter II: Of Principles Adverse To That Of Utility.

I. If the principle of utility be a right principle to be governed by, and that in all cases, it follows from what has been just observed, that whatever principle differs from it in any case must necessarily be a wrong one. To prove any other principle, therefore, to be a wrong one, there needs no more than just to show it to be what it is, a principle of which the dictates are in some point or other different from those of the principle of utility: to state it is to confute it.

II. A principle may be different from that of utility in two ways: 1. By being constantly opposed to it: this is the case with a principle which may be termed the principle of *asceticism*.[6] 2. By being sometimes opposed to it, and sometimes not, as it may happen: this is the case with another, which may be termed the principle of *sympathy* and *antipathy*.

III. By the principle of asceticism I mean that principle, which, like the principle of utility, approves or disapproves of any action, according to the tendency which it appears to have to augment or diminish the happiness of the party whose interest is in question; but in an inverse manner: approving of actions in as far as they tend to diminish his happiness; disapproving of them in as far as they tend to augment it.

IV. It is evident that any one who reprobates any the least particle of pleasure, as such, from whatever source derived, is *pro tanto* a partizan of the principle of asceticism. It is only upon that principle, and not from the principle of utility, that the most abominable pleasure which the vilest of malefactors ever reaped from his crime would be to be reprobated, if it stood alone. The case is, that it never does stand alone; but is necessarily followed by such a quantity of pain (or, what comes to the same thing, such a chance for a certain quantity of pain) that the pleasure in comparison of it, is as nothing: and this is the true and sole, but perfectly sufficient, reason for making it ground for punishment.

V. There are two classes of men of very different complexions, by whom the principle of asceticism appears to have been embraced; the one a set of moralists, the other a set of religionists. Different accordingly have been the motives which appear to have recommended it to the notice of these different parties. Hope, that is the prospect of pleasure, seems to have animated the former: hope, the aliment of philosophic pride: the hope of honour and reputation at the hands of men. Fear, that is the prospect of pain, the latter: fear, the offspring of superstitious fancy: the fear of future punishment at the hands of a splenetic and revengeful Deity. I say in this case fear: for of the invisible future, fear is more powerful than hope. These circumstances characterize the two different parties among the partizans of the principle of asceticism; the parties and their motives different, the principle the same.

VI. The religious party, however, appear to have carried it farther than the philosophical: they have acted more consistently and less wisely. The philosophical party have scarcely gone farther than to reprobate pleasure: the religious party have frequently gone so far as to make it a matter of merit and of duty to court pain. The philosophical party have hardly gone farther than the making pain a matter of indifference. It is no evil, they have said: they have not said, it is a good. They have not so much as reprobated all pleasure in the lump. They have discarded only what they have called the gross; that is, such as are organical, or of which the origin is easily traced up to such as are organical: they have even cherished and magnified the refined. Yet this, however, not under the name of pleasure: to cleanse itself from the sordes of its impure original, it was necessary it should change its name: the honourable, the glorious, the reputable, the becoming, the *honestum*, the *decorum*, it was to be called: in short, any thing but pleasure.

VII. From these two sources have flowed the doctrines from which the sentiments of the bulk of mankind have all along received a tincture of this principle; some from the philosophical, some from the religious, some from both. Men of education more frequently from the philosophical, as more suited to the elevation of their sentiments: the vulgar more frequently from the superstitious, as more suited to the narrowness of their intellect, undilated by knowledge: and to the abjectness of their condition, continually open to the attacks of fear. The tinctures, however, derived from the two sources, would naturally intermingle, insomuch that a man would not always know by which of them he was most influenced: and they would often serve to corroborate and enliven one another. It was this conformity that made a kind of alliance between parties of a complexion otherwise so dissimilar: and disposed them to unite upon various occasions against the common enemy, the partizan of the principle of utility, whom they joined in branding with the odious name of Epicurean.

VIII. The principle of asceticism, however, with whatever warmth it may have been embraced by its partizans as a rule of private conduct, seems not to have been carried to any considerable length, when applied to the business of government. In few instances it has been carried a little way by the philosophical party: witness the Spartan regimen. Though then, perhaps, it maybe considered as having been a measure of security: and an application, though a precipitate and perverse application, of the principle of utility. Scarcely in any instances, to any considerable length, by the religious: for the various monastic orders, and the societies of the Quakers, Dumplers, Moravians, and other religionists, have been free societies, whose regimen no man has been astricted to without the intervention of his own consent. Whatever merit a man may have thought there would be in making himself miserable, no such notion seems ever to have occurred to any of them, that it may be a merit, much less a duty, to make others miserable: although it should seem, that if a certain quantity of misery were a thing so desirable, it would not matter much whether it were brought by each man upon himself, or by one man upon another. It is true, that from the same source from whence, among the religionists, the attachment to the principle of asceticism took its rise, flowed other doctrines and practices, from which misery in abundance was produced in one man by the instrumentality of another: witness the holy wars, and the persecutions for religion. But the passion for producing misery in these cases proceeded upon some special ground: the exercise of it was confined to persons of particular descriptions: they were tormented, not as men, but as heretics and infidels. To have inflicted the same miseries on their fellow believers and fellow-sectaries, would have been as blameable in the eyes even of these religionists, as in those of a partizan o the principle of utility. For a man to give himself a certain number of stripes was indeed meritorious: but to give the same number of stripes to another man,

not consenting, would have been a sin. We read of saints, who for the good of their souls, and the mortification of their bodies, have voluntarily yielded themselves a prey to vermin: but though many persons of this class have wielded the reins of empire, we read of none who have set themselves to work, and made laws on purpose, with a view of stocking the body politic with the breed of highwaymen, housebreakers, or incendiaries. If at any time they have suffered the nation to be preyed upon by swarms of idle pensioners, or useless placemen, it has rather been from negligence and imbecility, than from any settled plan for oppressing and plundering of the people. If at any time they have sapped the sources of national wealth, by cramping commerce, and driving the inhabitants into emigration, it has been with other views, and in pursuit of other ends. If they have declaimed against the pursuit of pleasure, and the use of wealth, they have commonly stopped at declamation: they have not, like Lycurgas, made express ordinances for the purpose of banishing the precious metals. If they have established idleness by a law, it has been not because idleness, the mother of vice and misery, is itself a virtue, but because idleness (say they) is the road to holiness. If under the notion of fasting, they have joined in the plan of confining their subjects to a diet, thought by some to be of the most nourishing and prolific nature, it has been not for the sake of making them tributaries to the nations by whom that diet was to be supplied, but for the sake of, manifesting their own power, and exercising the obedience of the people. If they have established, or Suffered to be established, punishments for the breach of celibacy, they have done no more than comply with the petitions of those deluded rigorists, who, dupes to the ambitious and deep-laid policy of their rulers, first laid themselves under that idle obligation by a vow.

IX. The principle of asceticism seems originally to have bee t the reverie of certain hasty speculators, who having perceived, or fancied, that certain pleasures, when reaped in certain circumstances, have, at the long run, been attended with pains more than equivalent to them, took occasion to quarrel with e thing that offered itself under the name of pleasure. Having then got thus far, and having forgot the point which they set out from, they pushed on, and went so much further as to think it meritorious to fall in love with pain. Even this, we see, is a bottom but the principle of utility misapplied.

X. The principle of utility is capable of being consistently pursued; and it is but tautology to say, that the more consistently it is pursued, the better it must ever be for humankind. The principle of asceticism never was, nor ever can be, consistently pursued by any living creature. Let but one tenth part of the inhabitants of this earth pursue it consistently, and in a day's time they will have turned it into a hell.

XI. Among principles adverse[7] to that of utility, that which at this day seems to have most influence in matters of government, is what may be called the principle of sympathy and antipathy. By the principle of sympathy and antipathy, I mean that principle which approves or disapproves of certain actions, not on account of their tending to augment the happiness, nor yet on account of their tending to diminish the happiness of the party whose interest is in question, but merely because a man finds himself disposed to approve or disapprove of them: holding up that approbation or disapprobation as a sufficient reason for itself, and disclaiming the necessity of looking out for any extrinsic ground. Thus far in the general department of morals: and in the particular department of politics, measuring out the quantum (as well as determining the ground) of punishment, by the degree of the disapprobation.

XII. It is manifest, that this is rather a principle in name than in reality: it is not a positive principle of itself, so much as a term employed to signify the negation of all principle. What one

expects to find in a principle is something that points out some external consideration, as a means of warranting and guiding the internal sentiments of approbation and disapprobation: this expectation is but ill fulfilled by a proposition, which does neither more nor less than hold up each of those sentiments as a ground and standard for itself.

XIII. In looking over the catalogue of human actions (says a partizan of this principle) in order to determine which of them are to be marked with the seal of disapprobation, you need but to take counsel of your own feelings: whatever you find in yourself a propensity to condemn, is wrong for that very reason. For the same reason it is also meet for punishment: in what proportion it is adverse to utility, or whether it be adverse to utility at all, is a matter that makes no difference. In that same *proportion* also is it meet for punishment: if you hate much, punish much: if you hate little, punish little: punish as you hate. I you hate not at all, punish not at all: the fine feelings of the soul are not to be overborne and tyrannized by the harsh and rugged dictates of political utility.

XIV. The various systems that have been formed concerning the standard of right and wrong, may all be reduced to the principle of sympathy and antipathy. One account may serve for all of them. They consist all of them in so many contrivances for avoiding the obligation of appealing to any external standard, and for prevailing upon the reader to accept of the author's sentiment or opinion as a reason for itself. The phrases different, but the principle the same.[8]

XV. It is manifest, that the dictates of this principle will frequently coincide with those of utility, though perhaps without intending any such thing. Probably more frequently than not: and hence it is that the business of penal justice is carried on upon that tolerable sort of footing upon which we see it carried on in common at this day. For what more natural or more general ground of hatred to a practice can there be, than the mischievousness of such practice? What all men are exposed to suffer by, all men will be disposed to hate. It is far yet, however, from being a constant ground: for when a man suffers, it is not always that he knows what it is he suffers by. A man may suffer grievously, for instance, by a new tax, without being able to trace up the cause of his sufferings to the injustice of some neighbour, who has eluded the payment of an old one.

XVI. The principle of sympathy and antipathy is most apt to err on the side of severity. It is for applying punishment in many cases which deserve none: in many cases which deserve some, it is for applying more than they deserve. There is no incident imaginable, be it ever so trivial, and so remote from mischief, from which this principle may not extract a ground of punishment. Any difference in taste: any difference in opinion: upon one subject as well as upon another. No disagreement so trifling which perseverance and altercation Will not render serious. Each becomes in the other's eyes an enemy, and, if laws permit, a criminal.[9] This is one of the circumstances by which the human race is distinguished (not indeed to its advantage) from the brute creation.

XVII. It is not, however, by any means unexampled for this principle to err on the side of lenity. A near and perceptible mischief moves antipathy. A remote and imperceptible mischief, though not less real, has no effect. Instances in proof of this will occur in numbers in the course of the work. It would be breaking in upon the order of it to give them here.

XVIII. It may be wondered, perhaps, that in all this no mention has been made of the *theological* principle; meaning that principle which professes to recur for the standard of right and wrong to the will of God. But the case is, this is not in fact a distinct principle. It is never any thing more or less than one or other of the three before-mentioned principles presenting itself under another shape. The *will* of God here meant cannot be his revealed will, as contained in the sacred writings: for that is a system which nobody ever thinks of recurring to at this time of day, for the

details of political administration: and even before it can be applied to the details of private conduct, it is universally allowed, by the most eminent divines of all persuasions, to stand in need of pretty ample interpretations; else to what use are the works of those divines? And for the guidance of these interpretations, it is also allowed, that some other standard must be assumed. The will then which is meant on this occasion, is that which may be called the *presumptive* will: that is to say, that which is presumed to be his will on account of the conformity of its dictates to those of some other principle. What then may be this other principle? it must be one or other of the three mentioned above: for there cannot, as we have seen, be any more. It is plain, therefore, that, setting revelation out of the question, no light can ever be thrown upon the standard of right and wrong, by any thing that can be said upon the question, what is God's will. We may be perfectly sure, indeed, that whatever is right is conformable to the will of God: but so far is that from answering the purpose of showing us what is right, that it is necessary to know first whether a thing is right, in order to know from thence whether it be conformable to the will of God .[10]

XIX. There are two things which are very apt to be confounded, but which it imports us carefully to distinguish:-the motive or cause, which, by operating on the mind of an individual, is productive of any act: and the ground or reason which warrants a legislator, or other bystander, in regarding that act with an eye of approbation. When the act happens, in the particular instance in question, to be productive of effects which we approve of, much more if we happen to observe that the same motive may frequently be productive, in other instances, of the like effects, we are apt to transfer our approbation to the motive itself, and to assume, as the just ground for the approbation we bestow on the act, the circumstance of its originating from that motive. It is in this way that the sentiment of antipathy has often been considered as a just ground of action. Antipathy, for instance, in such or such a case, is the cause of an action which is attended with good effects: but this does not make it a right ground of action in that case, any more than in any other. Still farther. Not only the effects are good, but the agent sees beforehand that they will be so. This may make the action indeed a perfectly right action: but it does not make antipathy a right ground of action. For the same sentiment of antipathy, if implicitly deferred to, may be, and very frequently is, productive of the very worst effects. Antipathy, therefore, can never be a right ground of action. No more, therefore, can resentment, which, as will be seen more particularly hereafter, is but a modification of antipathy. The only right ground of action, that can possibly subsist, is, after all, the consideration of utility, which, if it is a right principle of action, and of approbation, in any one case, is so in every other. Other principles in abundance, that is, other motives, may be the reasons why such and such an act has been done: that is, the reasons or causes of its being done: but it is this alone that can be the reason why it might or ought to have been done. Antipathy or resentment requires always to be regulated, to prevent its doing mischief: to be regulated by what? always by the principle of utility. The principle of utility neither requires nor admits of any other regulator than itself.

Chapter III: Of The Four Sanctions Or Sources Of Pain And Pleasure.

I. It has been shown that the happiness of the individuals, of whom-a community is composed, that

is their pleasures and their security, is the end and the sole end which the legislator ought to have in view: the sole standard, in conformity to which each individual ought, as far as depends upon the legislator, to be *made* to fashion his behaviour. But whether it be this or any thing else that is to be done, there is nothing by which a man can ultimately be *done* to do it, but either pain or pleasure. Having taken a general view of these two grand objects (viz. pleasure, and what comes to the same thing, immunity from pain) in the character of final causes; it will be necessary to take a view of pleasure and pain itself, in the character of *efficient* causes or means.

II. There are four distinguishable sources from which pleasure and pain are in use to flow: considered separately, they may be termed the *physical*, the *political*, the *moral*, and the *religious*: and inasmuch as the pleasures and pairs belonging to each of them are capable of giving a binding force to any law or rule of conduct, they may all of them be termed *sanctions*.[11]

III If it be in the present life, and from the ordinary course of nature, not purposely modified by the interposition of the will of any human being, nor by any extraordinary interposition of any superior invisible being, that the pleasure or the pain takes place or is expected, it may be said to issue from or to belong to the *physical sanction*.

IV. If at the hands of a *particular* person or set of persons in the community, who under names correspondent to that of *judge*, are chosen for the particular purpose of dispensing it, according to the will of the sovereign or supreme ruling power in the state, it may be said to issue from the *political sanction*.[12]

V. If at the hands of such *chance* persons in the community, as the party in question may happen in the course of his life to have concerns with, according to each man's spontaneous disposition, and not according to any settled or concerted rule, it may be said to issue from the *moral* or *popular sanction*.

VI. If from the immediate hand of a superior invisible being, either in the present life, or in a future, it may be said to issue from the *religious sanctions*.

VII. Pleasures or pains which may be expected to issue from the *physical, political*, or *moral* sanctions, must all of them be expected to be experienced, if ever, in the *present* life: those which may be expected to issue from the *religious* sanction, may be expected to be experienced either in the *present* life or in a *future*.

VIII. Those which can be experienced in the present life, can of course be no others than such as human nature in the course of the present life is susceptible of: and from each of these sources may flow all the pleasures or pains of which, in the course of the present life, human nature is susceptible. With regard to these then (with which alone we have in this place any concern) those of them which belong to any one of those sanctions, differ not ultimately in kind from those which belong to any one of the other three: the only difference there is among them lies in the circumstances that accompany their production. A suffering which befalls a man in the natural and spontaneous course of things, shall be styled, for instance, a *calamity*; in which case, if it be supposed to befall him through any imprudence of his, it may be styled a punishment issuing from the physical sanction. Now the same suffering, if inflicted by the law, will be what is commonly called a *punishment;* if incurred for want of any friendly assistance, which the misconduct, or supposed misconduct, of the sufferer has occasioned to be withholden, a punishment issuing from the *moral* sanction; if through the immediate interposition of a particular providence, a punishment issuing from the religious sanction.[13]

IX. A man's goods, or his person, are consumed by fire. If this happened to him by what is called an accident, it was a calamity: if by reason of his own imprudence (for instance, from his neglecting to put his candle out) it may be styled a punishment of the physical sanction: if it happened to him by the sentence of the political magistrate, a punishment belonging to the political sanction; that is, what is commonly called a punishment: if for want of any assistance which his *neighbour* withheld from him out of some dislike to his moral character, a punishment of the moral sanction: if by an immediate act of *God's* displeasure, manifested on account of some sin committed by him, or through any distraction of mind, occasioned by the dread of such displeasure, a punishment of the *religious* sanction.

X. As to such of the pleasures and pains belonging to the religious sanction, as regard a future life, of what kind these may be we cannot know. These lie not open to our observation. During the present life they are matter only of expectation: and, whether that expectation be derived from natural or revealed religion, the particular kind of pleasure or pain, if it be different from all those which lie open to our observation, is what we can have no idea of. The best ideas we can obtain of such pains and pleasures are altogether unliquidated in point of quality. In what other respects our ideas of them *may* be liquidated will be considered in another place.[14]

XI. Of these four sanctions the physicalis altogether, we may observe, the ground-work of the political and the moral: so is it also of the religious, in as far as the latter bears relation to the present life. It is included in each of those other three. This may operate in any case, (that is, any of the pains or pleasures belonging to it may operate) independently of *them*: none of the mean operate but by means of this. In a word, the powers of nature may operate of themselves; but neither the magistrate, nor men at large, can operate, nor is God in the case in question *supposed* to operate, but through the powers of nature.

XII. For these four objects, which in their nature have so much in common, it seemed of use to find a common name. It seemed of use, in the first place, for the convenience of giving a name to certain pleasures and pains, for which a name equally characteristic could hardly otherwise have been found: in the second place, for the sake of holding up the efficacy of certain moral forces, the influence of which is apt not to be sufficiently attended to. Does the political sanction exert an influence over the conduct of mankind? The moral, the religious sanctions do so too. In every inch of his career are the operations Of the political magistrate liable to be aided or impeded by these two foreign powers: who, one or other of them, or both, are sure to be either his rivals or his allies. Does it happen to him to leave them out in his calculations? he will be sure almost to find himself mistaken in the result. Of an this we shall find abundant proofs in the sequel of this work. It behoves him, therefore, to have them continually before his eyes; and that under such a name as exhibits the relation they bear to his own purposes and designs.

Chapter IV: Value Of A Lot Of Pleasure Or Pain, How To Be Measured.

I. Pleasures then, and the avoidance of pains, are the ends which the legislator has in view: it behoves him therefore to understand their *value*. Pleasures and pains are the *instruments* he has to work with: it behoves him therefore to understand their force, which is again, in other words, their

value.

II. To a person considered *by himself*, the value of a pleasure or pain considered *by itself*, will be greater or less, according to the four following circumstances: [15]

1. Its *intensity*.

2. Its *duration*.

3. Its *certainty* or *uncertainty*.

4. Its *propinquity* or *remoteness*.

III. These are the circumstances which are to be considered in estimating a pleasure or a pain considered each of the m by itself. But when the value of any pleasure or pain is considered for the purpose of estimating the tendency of any *act* by which it is produced, there are two other circumstances to be taken into the account; these are,

5. Its *fecundity*, or the chance it has of being followed by, sensations of the *same* kind: that is, pleasures, if it be a pleasure: pains, if it be a pain.

6. Its *purity*, or the chance it has of *not* being followed by, sensations of the *opposite* kind: that is, pains, if it be a pleasure: pleasures, if it be a pain.

These two last, however, are in strictness scarcely to be deemed properties of the pleasure or the pain itself; they are not, therefore, in strictness to be taken into the account of the value of that pleasure or that pain. They are in strictness to be deemed properties only of the act, or other event, by which such pleasure or pain has been produced; and accordingly are only to be taken into the account of the tendency of such act or such event.

IV. To a *number* of persons, with reference to each of whom the value of a pleasure or a pain is considered, it will be greater or less, according to seven circumstances: to wit, the six preceding ones; *viz*.

1. Its *intensity*.

2. Its *duration*.

3. Its *certainty* or *uncertainty*.

4. Its *propinquity* or *remoteness*.

5. Its *fecundity*.

6. Its *purity*.

And one other; to wit:

7. Its *extent*; that is, the number of persons to whom it extends; or (in other words) who are affected by it.

V. To take an exact account then of the general tendency of any act, by which the interests of a community are affected, proceed as follows. Begin with any one person of those whose interests seem most immediately to be affected by it: and take an account,

1. Of the value of each distinguishable *pleasure* which appears to be produced by it in the *first* instance.

2. Of the value of each *pain* which appears to be produced by it in the *first* instance.

3. Of the value of each pleasure which appears to be produced by it *after* the first. This constitutes the *fecundity* of the first *pleasure* and the *impurity* of the first pain.

4. Of the value of each pain which appears to be produced by it after the first. This constitutes the *fecundity* of the first *pain*, and the *impurity* of the first pleasure.

5. Sum up all the values of all the pleasures on the one side, and those of all the pains on the other. The balance, if it be on the side of pleasure, will give the *good* tendency of the act upon the whole, with respect to the interests of that *individual* person; if on the side of pain, the bad tendency of it upon the whole.

6. Take an account of the *number* of persons whose interests appear to be concerned; and repeat the above process with respect to each. *Sum up* the numbers expressive of the degrees of *good* tendency, which the act has, with respect to each individual, in regard to whom the tendency of it is *good* upon the whole: do this again with respect to each individual, in regard to whom the tendency of it is *good* upon the whole: do this again with respect to each individual, in regard to whom the tendency of it is *bad* upon the whole. Take the *balance*; which, if on the side of *pleasure*, will give the general *good tendency* of the act, with respect to the total number or community of individuals concerned; if on the side of pain, the general *evil tendency*, with respect to the same community.

VI. It is not to be expected that this process should be strictly pursued previously to every moral judgment, or to every legislative or judicial operation. It may, however, be always kept in view: and as near as the process actually pursued on these occasions approaches to it, so near will such process approach to the character of an exact one.

VII. The same process is alike applicable to pleasure and pain, in whatever shape they appear: and by whatever denomination they are distinguished: to pleasure, whether it be called *good* (which is properly the cause or instrument of pleasure) or *profit* (which is distant pleasure, or the cause or instrument o distant pleasure,) or *convenience*, or *advantage*, *benefit*, *emolument*, *happiness*, and so forth: to pain, whether it be called *evil*, (which corresponds to good) or *mischief*, or *inconvenience*, or *disadvantage*, or *loss*, or *unhappiness*, and so forth.

VIII. Nor is this a novel and unwarranted, any more than it is a useless theory. In all this there is nothing but what the practice of mankind, wheresoever they have a clear view of their own interest, is perfectly conformable to. An article of property, an estate in land, for instance, is valuable, on what account? On account of the pleasures of all kinds which it enables a man to produce, and what comes to the same thing the pains of all kinds which it enables him to avert. But the value of such an article of property is universally understood to rise or fall according to the length or shortness of the time which a man has in it: the certainty or uncertainty of its coming into possession: and the nearness or remoteness of the time at which, if at all, it is to come into possession. As to the *intensity* of the pleasures which a man may derive from it, this is never thought of, because it depends upon the use which each particular person may come to make of it; which cannot be estimated till the particular pleasures he may come to derive from it, or the particular pains he may come to exclude by means of it, are brought to view. For the same reason, neither does he think of the *fecundity* or *purity* of those pleasures.

Thus much for pleasure and pain, happiness and unhappiness, in *general*. We come now to consider the several particular kinds of pain and pleasure.

Notes

[2]Note by the Author, July 1822.

To this denomination has of late been added, or substituted, the *greatest happiness* or *greatest felicity* principle: this for shortness, instead of saying at length *that principle* which states the greatest happiness of all those whose interest is in question, as being the right and proper, and only right and proper and universally desirable, end of human action: of human action in every situation, and in particular in that of a functionary or set of functionaries exercising the powers of Government. The word *utility* does not so clearly point to the ideas of *pleasure* and *pain* as the words *happiness* and *felicity* do: nor does it lead us to the consideration of the *number*, of the interests affected; to the *number*, as being the circumstances, which contributes, in the largest proportion, to the formation of the standard here in question; the *standard of right and wrong*, by which alone the propriety of human conduct, in every situation, can with propriety be tried. This want of a sufficiently manifest connexion between the ideas of *happiness* and *pleasure* on the one hand, and the idea of *utility* on the other, I have every now and then found operating, and with but too much efficiency, as a bar to the acceptance, that might otherwise have been given, to this principle.

[3]The word principle is derived from the Latin principium: which seems to be compounded of the two words, *primus*, first, or chief, and *cipium*, a termination which seems to be derived from *capio*, to take, as in *mancipium, municipium*; to which are analogous, *auceps, forceps*, and others. It is a term of very vague and very extensive signification: it is applied to any thing which is conceived to serve as a foundation or beginning to any series of operations: in some cases, of physical operations; but of mental operations in the present case.

The principle here in question may be taken for an act of the mind; a sentiment; a sentiment of approbation; a sentiment which, when applied to an action, approves of its utility, as that quality of it by which the measure of approbation or disapprobation bestowed upon it ought to be governed.

[4]Interest is one of those words, which not having any superior genus, cannot in the ordinary way be defined.

[5]'The principle of utility (I have heard it said) is a dangerous principle: it is dangerous on certain occasions to consult it.' This is as much as to say, what? that it is not consonant to utility, to consult utility: in short, that it is *not* consulting it, to consult it.

Addition by the Author, July 1822.

Not long after the publication of the Fragment on Government, anno 1776, in which in the character of an all-comprehensive and all-commanding principle, the principle of *utility* was brought to view, one person by whom observation to the above effect was made was *Alexander Wedderburn*, at that time Attorney or Solicitor General, afterwards successively Chief Justice of the Common Pleas, and Chancellor of England, under the successive titles of Lord Loughborough and Earl of Rosslyn. It was made -- not indeed in my hearing, but in the hearing of a person by whom it was almost immediately communicated to me. So far from being self-contradictory, it was

a shrewd and perfectly true one. By that distinguished functionary, the state of the Government was thoroughly understood: by the obscure individual, at that time not so much as supposed to be so: his disquisitions had not been as yet applied, with any thing like a comprehensive view, to the field of Constitutional Law, nor therefore to those features of the English Government, by which the greatest happiness of the ruling *one* with or without that of a favoured few, are now so plainly seen to be the only ends to which the course of it has at any time been directed. The *principle of utility* was an appellative, at that time employed -- employed by me, as it had been by others, to designate that which, in a more perspicuous and instructive manner, may, as above, be designated by the name of the *greatest happiness principle*. 'This principle (said Wedderburn) is a dangerous one" Saying so, he said that which, to a certain extent, is strictly true: a principle, which lays down, as the only *right* and justifiable end of Government, the greatest happiness of the greatest number -- how can it be denied to be a dangerous one? dangerous it unquestionably is, to every government which has for its *actual* end or object, the greatest happiness of a certain *one*, with or without the addition of some comparatively small number of others, whom it is matter of pleasure or accommodation to him to admit, each of them, to a share in the concern, on the footing of so many junior partners. *Dangerous* it therefore really was, to the interest -- the sinister interest -- of all those functionaries, himself included, whose interest it was, to maximize delay, vexation, and expense, in judicial and other modes of procedure, for the sake of the profit, extractable out of the expense. In a Government which had for its end in view the greatest happiness of the greatest number, Alexander Wedderburn might have been Attorney general and then Chancellor: but he would not have been Attorney General with L15,000 a year, nor chancellor, with a peerage with a veto upon all justice, with L25,000 a year, and with 500 sinecures at his disposal, under the name of Ecclesiastical Benefices, besides *et caeteras*.

[6]Ascetic is a term that has been sometimes applied to Monks. It comes from a Greek word which signifies exercise. The practices by which Monks sought to distinguish themselves from other men were called their Exercises. These exercises consisted in so many contrivances they had for tormenting themselves. By this they thought to ingratiate themselves with the Deity. For the Deity, said they, is a Being of infinite benevolence: now a Being of the most ordinary benevolence is pleased to see others make themselves as happy as they can: therefore to make ourselves as unhappy as we can is the way to please the Deity. If any body asked them, what motive they could find for doing all this? Oh! said they, you are not to imagine that we are punishing ourselves for nothing: we know very well what we are about. You are to know, that for every grain of pain it costs us now, we are to have a hundred grains of pleasure by and by. The case is, that God loves to see us torment ourselves at present: indeed he has as good as told us so. But this is done only to try us, in order just to see how we should behave: which it is plain he could not know, without making the experiment. Now then, from the satisfaction it gives him to see us make ourselves as unhappy as we can make ourselves in this present life, we have a sure proof of the satisfaction it will give him to see us as happy as he can make us in a life to come.

[7]The following Note was first printed in January 1789.

It ought rather to have been styled, more extensively, the principle of *caprice*. Where it applies to the choice of actions to be marked out for injunction or prohibition, for reward or punishment, (to stand, in a word, as subjects for obligations to be imposed,) it may indeed with propriety be termed, as in the text, the principle of *sympathy* and *antipathy*. But this appellative does not so well apply to it, when occupied in the choice of the *events* which are to serve as sources of *title* with respect to *rights*: where the actions prohibited and allowed the obligations and rights, being

already fixed, the only question is, under what circumstances a man is to be invested with the one or subjected to the other? from what incidents occasion is to be taken to invest a man, or to refuse to invest him, with the one, or to subject him to the other? from what incidents occasion is to be taken to invest a man, or to refuse to invest him, with the one, or to subject him to the other? from what incidents occasion is to be taken to invest a man, or to refuse to invest him, with the one, or to subject him to the other? In this latter case it may more appositely be characterized by the name of the *phantastic principle*. Sympathy and antipathy are affections of the *sensible* faculty. But the choice of *titles* with respect to *rights*, especially with respect to proprietary rights, upon grounds unconnected with utility, has been in many instances the work, not of the affections but of the imagination.

When, in justification of an article of English Common Law, calling uncles to succeed in certain cases in preference to fathers, Lord Coke produced a sort of ponderosity he had discovered in rights, disqualifying them from ascending in a straight line, it was not that he *loved* uncles particularly, or *hated* fathers, but because the analogy, such as it was, was what his imagination presented him with, instead of a reason, and because, to a judgment unobservant of the standard of utility, or unacquainted with the art of consulting it, where affection is out of the way, imagination is the only guide.

When I know not what ingenious grammarian invented the proposition *Delegatus non potest delegare*, to serve as a rule of law, it was not surely that he had any antipathy to delegates of the second order, or that it was any pleasure to him to think of the ruin which, for want of a manager at home, may befall the affairs of a traveller, whom an unforeseen accident has deprived of the object of his choice: it was, that the incongruity, of giving the same law to objects so contrasted as *active* and *passive* are, was not to be surmounted, and that *-atus* chimes, as well as it contrasts, with *-are*.

When that inexorable maxim, (of which the dominion is no more to be defined, than the date of its birth, or the name of its father, is to be found,) was imported from England for the government of Bengal, and the whole thunders of *ex post facto* justice, it blameless magistracy perishing in the unoffended authors of their misery; absorbing the whole imagination, had drowned the cries of humanity along with the dictates of common sense. *Fiat Justitia, ruat caelum*, says another maxim, as full of extravagance as it is of harmony: Go heaven to wreck -- so justice be but done: -- and what is the ruin of kingdoms, in comparison of the wreck of heaven?

So again, when the Prussian chancellor, inspired with the wisdom of I know not what Roman sage, proclaimed in good Latin, for the edification of German ears, *Servitus servitutis non datur*, [Cod. Fred. tom. ii. par. 2. liv. 2 tit. x. sect 6. p. 308.] it was not that he had conceived any aversion to the life-holder who, during the continuance of his term, should wish to gratify a neighbour with a right of way or water, or to the neighbour who should wish to accept of the indulgence; but that, to a jurisprudential ear, *-tus -tutis* sound little less melodious than *-atus -are*. Whether the melody of the maxim was the real reason of the rule, is not left open to dispute: for it is ushered in by the conjunction *quia*, reason's appointed harbinger: *quia servitus servitutis non datur*.

Neither would equal melody have been produced, nor indeed could similar melody have been called for, in either of these instances, by the n they are opposed to general rules, and are absorbed in them, that more specific ones can obtain a separate existence. *Delegatus potest delegare*, and *Servitus servitutis datur* provisions already included under the general adoption of contracts, would have been as unnecessary to the apprehension and the memory, as, in comparison of their

energetic negatives, they are insipid to the ear.

Were the inquiry diligently made, it would be found that the goddess of harmony has exercised more influence, however latent, over the dispensations of Themis, than her most diligent historiographers, or even her most passionate panegyrists, seem to have been aware of. Every one knows how, by the ministry of Orpheus, it was she who first collected the sons of men beneath the shadow of the sceptre: yet, in the midst of continual experience, men seem yet to learn, with what successful diligence she has laboured to guide it in its course. Every one knows, that measured numbers were the language of the infancy of law: none seem to have observed, with what imperious sway they have governed her maturer age. In English jurisprudence in particular, the connexion betwixt law and music, however less perceived than in Spartan legislation, is not perhaps less real nor less close. the music of the Office, though not of the same kind, is not less musical in its kind, than the music of the Theatre; that which hardens the heart, than that which softens it: -- sostenutos as long, cadences as sonorous; and those governed by rules, though not yet promulgated, not less determinate. Search indictments, pleadings, proceedings in chancery, conveyances: whatever trespasses you may find against truth or common sense, you will find none against the laws of harmony. The English Liturgy, justly as this quality has been extolled in that sacred office, possesses not a greater measure of it, than is commonly to be found in an English Act of Parliament. Dignity, simplicity, brevity, precision, intelligibility, possibility of being retained or so much as apprehended. every thing yields to Harmony. Volumes might be filled, shelves loaded, with the sacrifices that are made to this insatiate power. Expletives her ministers in Grecian poetry are not less busy, though in different shape and bulk, in English legislation: in the former, they are monosyllables: in the latter, they are whole lines.

To return to the *principle of sympathy and antipathy*: a term preferred at first, on account of its impartiality, to the *principle of caprice*. The choice of an appellative, in the above respects too narrow, was owing to my not having , at that time, extended my views over the civil branch of law, any otherwise than as I had found it inseparably involved in the penal. But when we come to the former branch, we shall see the *phantastic* principle making at least as great a figure there, as the principle of *sympathy and antipathy* in the latter.

In the days of Lord Coke, the light of utility can scarcely be said to have as yet shone upon the face of Common Law. If a faint ray of it, under the name of the *argumentum ad inconvenienti*, is to be found in a list of about twenty topics exhibited by that great lawyer as the co-ordinate leaders of that all-perfect system, the admission, so circumstanced, is as sure a proof of neglect, as to the statues of Brutus and Cassius, exclusion was a cause of notice. It stands, neither in the front nor in the rear, nor in any post of honour; but huddled in towards the middle, without the smallest mark of preference [Coke, Littleton, II. a.] Nor is this Latin *inconvenience* by any means the same thing with the English one. It stands distinguished from *mischief*: and because by the vulgar it is taken for something less bad, it is given by the learned as something worse. *The law prefers a mischief to an inconvenience,* says an admired maxim, and the more admired, because as nothing is expressed by it, the more is supposed to be understood.

Not that there is any avowed, much less constant opposition, between the prescriptions of utility and the operations of the common law: such constancy we have seen to be too much even for ascetic fervor. [Supra, par. x] From time to time instinct would unavoidably betray them into the paths of reason: instinct which, however it may be cramped, can never be killed by education. the cobwebs spun out of the materials brought together by 'the competition of opposite analogies,' can never have ceased being warped by the silent attraction of the rational principle: though it should

have been, as the needle is by the magnet, without the privity of conscience.

[8]It is curious enough to observe the variety of inventions men have hit upon, and the variety of phrases they have brought forward, in order conceal from the world and, if possible, from themselves this very and therefore very pardonable self-sufficiency.

1. One man says, he has a thing made on purpose to tell him what is right and what is wrong; and that it is called a *moral sense*: and then goes to work at his ease, and says, such a thing is right, and such a thing is wrong -- why? 'because my moral sense tells me it is.'

2. Another man comes and alters the phrase: leaving out *moral* and putting in common, in the room of it. He then tells you that his common sense teaches him what is right and wrong, as surely as the other's moral sense did: meaning by common sense, a sense of some kind or other, which, he says, is possessed by all mankind: the sense of those, whose sense is not the same as the author's being struck out of the account as not worth taking. This contrivance does better than the other; for a moral sense, being a new thing, a man may feel about him a good while without being able to find it out: but common sense is as old as the creation; and there is no man but would be ashamed to be thought not to have as much of it as his neighbours. It has another great advantage: by appearing to share power, it lessens envy: for when a man gets up upon this ground, in order to anathematize those who differ from him, it is not by a *sic volo sic jubeo*, but by a *velitis jubeatis*.

3. Another man comes, and says, that as to a moral sense indeed, he cannot find that he has any such thing : that however he has an *understanding*, which will do quite as well. This understanding, he says, is the standard of right and wrong: it tells him so and so. All good and wise men understand as he does: if other men's understandings differ in any point from his, so much the worse for them: it is a sure sign they are either defective or corrupt.

4. Another man says, that there is an eternal and immutable Rule of Right: that that rule of right dictates so and so: and then he begins giving you his sentiments upon any thing that comes uppermost: and these sentiments (you are to take for granted) are so many branches of the eternal rule of right.

5. Another man, or perhaps the same man (it's no matter) says, that there are certain practices conformable, and others repugnant, to the fitness of things; and then he tells you, at his leisure, what practices are conformable and what repugnant: just as he happens to like a practice or dislike it.

6. A great multitude of people we continually talking of the Law of Nature; and then they go on giving you their sentiments about what is right and what is wrong: and these sentiments, you are to understand, are so many chapters and sections of the Law of Nature.

7. Instead of the phrase, Law of Nature, you have sometimes, Law of Reason, Right Reason, Natural Justice, Natural Equity, Good Order. Any of them will do equally well. this latter is most used in politics. The three last are much more tolerable than the others, because they do not very explicitly claim to be any thing more than phrases: they insist but feebly upon the being looked upon as so many positive standards of themselves, and seem content to be taken, upon occasion, for phrases expressive of the conformity of the thing in question to the proper standard, whatever that may be. On most occasions, however, it will be better to say *utility: utility* is clearer, as referring more explicitly to pain and pleasure.

8. We have one philosopher, who says, there is no harm in any thing in the world but in telling a lie: and that if, for example, you were to murder your own father, this would not only be a

particular way of saying, he was not your father. Of course, when this philosopher sees any thing that he does not like, he says, it is a particular way of telling a lie. It s saying, that the act ought to be done, or may be done, when, *in truth*, it ought not to be done.

9. The fairest and openest of them all is that sort of man who speaks out and says, I am of the number of the Elect: now God himself takes care to inform the Elect what is right: and that with so good effect, and let them strive ever so, they cannot help not only knowing it but practising it. If therefore a man wants to know what is right and what is wrong, he has nothing to do but to come to me.

It is upon the principle of antipathy that such and such acts are often reprobated on the score of their being *unnatural*: the practice of exposing children, established among the Greeks and Romans, was an unnatural practice. Unnatural, when it means any thing, means unfrequent: and there it means something; although nothing to the present purpose. But here it means no such thing: for the frequency of such acts is perhaps the great complaint. It therefore means nothing; nothing, I mean, which there is in the act itself. All it can serve to express is, the disposition of the person who is talking of it: the disposition he is in to be angry at the thoughts of it. Does it merit his anger? very likely it may: but whether it does or no is a question, which, to be answered rightly, can only be answered upon the principle of utility.

Unnatural, is as good a word as moral sense, or common sense; and would be as good a foundation for a system. such an act is unnatural; that is, repugnant to nature: for I do not like to practise it: and, consequently, do not practise it. It is therefore repugnant to what ought to be the nature of every body else.

The mischief common to all these ways of thinking and arguing (which, in truth, as we have seen, are but one and the same method, couched in different forms of words) is their serving as a cloke, and pretence, and aliment, to despotism: if not a despotism in practice, a despotism however in disposition: which is but too apt, when pretence and power offer, to show itself in practice. The consequence is, that with intentions very commonly of the purest kind, a man becomes a torment either to himself or his fellow-creatures. If he be of the melancholy cast, he sits in silent grief, bewailing their blindness and depravity: if of the irascible, he declaims with fury and virulence against all who differ from him; blowing up the coals of fanaticism, and branding with the charge of corruption and insincerity, every man who does not think, or profess to think, as he does.

If such a man happens to possess the advantages of style, his book may do a considerable deal of mischief before the nothingness of it is understood.

These principles, if such they can be called, it is more frequent to see applied to morals than to politics: but their influence extends itself to both. In politics, as well as morals, a man will be at least equally glad of a pretence for deciding any question in the manner that best pleases him, without the trouble of inquiry. If a man is an infallible judge of what is right and wrong in the actions of private individuals, why not in the measures to be observed by public men in the direction of those actions? accordingly (not to mention other chimeras) I have more than once known to pretended law of nature set up in legislative debates, in opposition to arguments derived from the principle of utility.

'But is it never, then, from any other considerations than those of utility, that we derive our notions of right and wrong?' I do not know: I do not care. Whether a moral sentiment can be originally conceive from any other source than a view of utility, is one question: whether upon examination and reflection it can, in point of fact, be actually persisted in and justified on any other ground, by

a person reflecting within himself, is another: whether in point of right it can properly be justified on any other ground, by a person addressing himself to the community, is a third. The two first are questions of speculation: it matters not, comparatively speaking, how they are decided. The last is a question of practice: the decision of it is of as much importance as that of any can be.

'I feel in myself,' (say you) 'a disposition to approve of such or such an action in a moral view: but this is not owing to any notions I have of its being a useful one to the community. I do not pretend to know whether it be an useful one or not: it may be, for aught I know, a mischievous one." "But is it then,' (say I) 'a mischievous one? examine; and if you can make yourself sensible that it is so, then, if duty means any thing, that is, moral duty, it is your *duty* at least to abstain from it: and more than that, if it is what lies in your power, and can be done without too great a sacrifice, to endeavour to prevent it. It is not your cherishing the notion of it in your bosom, and giving it the name of virtue, that will excuse you.'

'I feel in myself' (say you again) 'a disposition to detest such or such an action in a moral view; but this is not owing to any notions I have of its being a mischievous one to the community. I do not pretend to know whether it be a mischievous one or not: it may be not a mischievous one: it may be, for aught I know, an useful one.' -- 'May it indeed,' (say I) 'an useful one? but let me tell you then, that unless duty, and right and wrong, be just what you please to make them, if it really be not a mischievous one, and any body has a mind to do it, it is no duty of yours, but, on the contrary, it would be very wrong in you, to take upon you to prevent him: detest it within yourself as much as you please; that may be a very good reason (unless it be also a useful one) for your not doing it yourself: but if you go about, by word or deed, to do any thing to hinder him, or make him suffer for it, it is you, and not he, that have done wrong: it is not your setting yourself to blame his conduct, or branding it with the name of vice, that will make him culpable, or you blameless. Therefore, if you can make yourself content that he shall be of one mind, and you of another, about that matter, and so continue, it is well: but if nothing will serve you, but that you and he must needs e of the same mind, I'll tell you what you have to do: it is for you to get the better of your antipathy, not for him to truckle to it.'

[9]King James the First of England had conceived a violent antipathy against Arians: two of whom he burnt (Hume's Hist. Vol. 6). This gratification he procured himself without much difficulty: the notions of the times were favourable to it. He wrote a furious book against Vorstius, for being what was called an Arminian: for Vorstius was at a distance. He also wrote a furious book, called 'A Counterblast to Tobacco,' against the use of that drug, which Sir Walter Raleigh had then lately introduced. Had the notions of the times co-operated with him, he would have burnt the Anbaptist and the smoker of tobacco in the same fire. However he had the satisfaction of putting Raleigh to death afterwards, though for another crime.

Disputes concerning the comparative excellence of France and Italian music have occasioned very serious bickerings at Paris. One of the parties would not have been sorry (say Mr. D'Alembert [Melanges Essai sur la Liberte de la Musique.]) to have brought government into the quarrel. Pretences were sought after and urged. Long before that, a dispute of like nature, and of at least equal warmth, had been kindled at London upon the comparative merits of two composers at London; where riots between the approvers and disapprovers of a new play are, at this day, not unfrequent. The ground of quarrel between the Big-endians and Little-endians in the fable, was not more frivolous than many an one which has laid empires desolate. In Russia, it is said, there was a time when some thousands of persons lost their lives in a quarrel, in which the government

had taken part, about the number of fingers to be used in making the sign of the cross. This was in days of yore: the ministers of Catherine II. are better *instructed* (Instruct. art. 474. 475, 476) than to take any other part in such disputes, than that of preventing the parties concerned from doing one another a mischief.

[10]The principle of theology refers every thing to God's pleasure. But what is God's pleasure? God does not, he confessedly does not now, either speak or write to us. How then are we to know what is his pleasure? By observing what is our own pleasure, and pronouncing it to be his. Accordingly, what is called the pleasure of god, is and must necessarily be (revelation apart) neither more nor less than the good pleasure of the person, whoever he be, who is pronouncing what he believes, or pretends, to be God's pleasure. How know you it to be God's pleasure that such or such an act should be abstained from? whence come you even to suppose as much? "Because the commission of it is attended with a gross and sensual, or at least with a trifling and transient satisfaction;' says the partizan of the principle of asceticism: 'Because I detest the thoughts of it; and I cannot, neither ought I to be called upon to tell why;' says he who proceeds upon the principles of antipathy. In the words of one or other of these must that persons necessarily answer (revelation apart) who professes to take for his standard the will of God.

[11]Sanctio, in Latin, was used to signify the *act of binding*, and, by a common grammatical transition, *any thing which serves to bind a man*: to wit, to the observance of such or such a mode of conduct. According to a Latin grammarian (Servius. See Ainsworth's Dict. ad verbum *Sanctio*.), the import of the word is derived by rather a far-fetched process (such as those commonly are, and in a great measure indeed must be, by which intellectual ideas are derived from sensible ones) from the word *sanguis*, blood: because, among the Romans, with a view to inculcate into the people a persuasion that such or such a mode of conduct would be rendered obligatory upon a man by the force of what I call the religious sanction (that is, that he would be made to suffer by the extraordinary interposition of some superior being, if he failed to observe the mode of conduct in question) certain ceremonies were contrived by the priests: in the course of which ceremonies the blood of victims was made use of.

A Sanction then is a source of obligatory powers or *motives*: that is, of *pains* and *pleasures*; which, according as they are connected with such or such modes of conduct, operate, and are indeed the only things which can operate, as *motives*. See Chap. X. [Motives].

[12]Better termed *popular*, as more directly indicative of its constituent cause; as likewise of its relation to the more common phrase *public opinion*, in French *opinion publique*, the name there given to that tutelary power, of which of late so much is said, and by which so much is done. The latter appellation is however unhappy and inexpressive; since if *opinion* is material, it is only in virtue of the influence it exercises over action, through the medium of the affections and the will.

[13]A suffering conceived to befall a man by the immediate act of God, as above, is often, for shortness' sake, called a *judgment*: instead of saying a suffering inflicted on him in consequence of a special judgment formed, and resolution thereupon taken, by the Deity.

[14]See ch. xii. [Cases unmeet] par. 2. note.

[15]These circumstances have since been dominated *elements* or *dimensions of value* in a pleasure or a pain.

Nor long after the publication of the first edition, the following memoriter verses were framed, in the view of lodging more effectually, in the memory, these points, on which the whole fabric of

morals and legislation may be seen to rest.

> ***Intense, long, certain, speedy, fruitful, pure*** **--**
> **Such marks in *pleasures* and in *pains* endure.**
> **Such pleasures seek if *private* be thy end:**
> **If it be *public*, wide let them *extend*.**
> **Such *pains* avoid, whichever by thy view:**

If pains *must* come, let them *extend* to few.

Chapter I: Of The Principle Of Utility.

I. Nature has placed mankind under the governance of two sovereign masters, <pain> and <pleasure>. It is for them alone to point out what we ought to do, as well as to determine what we shall do. On the one hand the standard of right and wrong, on the other the chain of causes and effects, are fastened to their throne. They govern us in all we do, in all we say, in all we think: every effort we can make to throw off our subjection, will serve but to demonstrate and confirm it. In words a man may pretend to abjure their empire: but in reality he will remain subject to it all the while. The <principle of utility>[2] recognises this subjection, and assumes it for the foundation of that system, the object of which is to rear the fabric of felicity by the hands of reason and of law. Systems which attempt to question it, deal in sounds instead of sense, in caprice instead of reason, in darkness instead of light.

But enough of metaphor and declamation: it is not by such means that moral science is to be improved.

II. The principle of utility is the foundation of the present work: it will be proper therefore at the outset to give an explicit and determinate account of what if; meant by it. By the principle[3]of utility is meant that principle which approves or disapproves of every action whatsoever, according to the tendency which it appears to have to augment or diminish the happiness of the party whose interest is in question: or, what is the same thing in other words, to promote or to oppose that happiness. I say of every action whatsoever; and therefore not, only of every action of a private individual, but of every measure of government.

III. By utility is meant that property in any object, whereby it tends to produce benefit, advantage, pleasure, good, or happiness, (all this in the present case comes to the same thing) or (what comes again to the same thing) to prevent the happening of mischief, pain, evil, or unhappiness to the party whose interest is considered: if that party be the community in general, then the happiness of the community: if a particular individual, then the happiness of that individual.

IV. The interest of the community is one of the most general expressions that can occur in the phraseology of morals: no wonder that the meaning of it is often lost. When it has meaning, it is this. The community is a fictitious <body>, composed of the individual persons who are considered as constituting as it were its <members>. The interest of the community then is, what? -- the sum of the interests of the

several members who compose it.

V. It is in vain to talk of the interest of the community, without understanding what is the interest of the individual.[4] A thing is said to promote the interest, or to be <for> the interest, of an individual, when it tends to add to the sum total of his pleasures: or, what comes to the same thing, to diminish the sum total of his pains. VI. An action then may be said to be conformable to the principle of utility, or, for shortness sake, to utility, (meaning with respect to the community at large) when the tendency it has to augment the happiness of the community is greater than any it has to diminish it.

VII. A measure of government (which is but a particular kind of action, performed by a particular person or persons) may be said to be conformable to or dictated by the principle of utility, when in like manner the tendency which it has to augment the happiness of the community is greater than any which it has to diminish it.

VIII. When an action, or in particular a measure of government, is supposed by a man to be conformable to the principle of utility, it may be convenient, for the purposes of discourse, to imagine a kind of law or dictate, called a law or dictate of utility: and to speak of the action in question, as being conformable to such law or dictate.

IX. A man may be said to be a partizan of the principle of utility, when the approbation or disapprobation he annexes to any action, or to any measure, is determined by and proportioned to the tendency which he conceives it to have to augment or to diminish the happiness of the community: or in other words, to its conformity or unconformity to the laws or dictates of utility.

X. Of an action that is conformable to the principle of utility one may always say either that it is one that ought to be done, or at least that it is not one that ought not to be done. One may say also, that it is right it should be done; at least that it is not wrong it should be done: that it is a right action; at least that it is not a wrong action. When thus interpreted, the words <ought>, and <right> and <wrong>, and others of that stamp, have a meaning: when otherwise, they have none.

XI. Has the rectitude of this principle been ever formally contested? It should seem that it had, by those who have not known what they have been meaning. Is it susceptible of any direct proof? it should seem not: for that which is used to prove every thing else, cannot itself be proved: a chain of proofs must have their commencement somewhere. To give such proof is as impossible as it is needless.

XII. Not that there is or ever has been that human creature breathing, however stupid or perverse, who has not on many, perhaps on most occasions of his life, deferred to it. By the natural constitution of the human frame, on most occasions of their lives men in general embrace this principle, without thinking of it: if not for the ordering of their own actions, yet for the trying of their own actions, as well as of those of other men. There have been, at the same time, not many, perhaps, even

of the most intelligent, who have been disposed to embrace it purely and without reserve. There are even few who have not taken some occasion or other to quarrel with it, either on account of their not understanding always how to apply it, or on account of some prejudice or other which they were afraid to examine into, or could not bear to part with. For such in the stuff that man is made of: in principle and in practice, in a right track and in a wrong one, the rarest of all human qualities is consistency.

XIII. When a man attempts to combat the principle of utility, it is with reasons drawn, without his being aware of it, from that very principle itself.[5] His arguments, if they prove any thing, prove not that the principle is wrong, but that, according to the applications he supposes to be made of it, it is <misapplied>. Is it possible for a man to move the earth? Yes; but he must first find out another earth to stand upon.

XIV. To disprove the propriety of it by arguments is impossible; but, from the causes that have been mentioned, or from some confused or partial view of it, a man may happen to be disposed not to relish it. Where this is the case, if he thinks the settling of his opinions on such a subject worth the trouble, let him take the following steps, and at length, perhaps, he may come to reconcile himself to it.

1. Let him settle with himself, whether he would wish to discard this principle altogether; if so, let him consider what it is that all his reasonings (in matters of politics especially) can amount to?

2. If he would, let him settle with himself, whether he would judge and act without any principle, or whether there is any other he would judge and act by?

3. If there be, let him examine and satisfy himself whether the principle he thinks he has found is really any separate intelligible principle; or whether it be not a mere principle in words, a kind of phrase, which at bottom expresses neither more nor less than the mere averment of his own unfounded sentiments; that is, what in another person he might be apt to call caprice?

4. If he is inclined to think that his own approbation or disapprobation, annexed to the idea of an act, without any regard to its consequences, is a sufficient foundation for him to judge and act upon, let him ask himself whether his sentiment is to be a standard of right and wrong, with respect to every other man, or whether every man's sentiment has the same privilege of being a standard to itself?

5. In the first case, let him ask himself whether his principle is not despotical, and hostile to all the rest of human race?

6. In the second case, whether it is not anarchial, and whether at this rate there are not as many different standards of right and wrong as there are men? and whether even to the same man, the same thing, which is right to-day, may not (without the least change in its nature) be wrong to-morrow? and whether the same thing is not right and wrong in the same place at the same time? and in either case, whether all argument is not at an end?

and whether, when two men have said, 'I like this,' and 'I don't like it,' they can (upon such a principle) have any thing more to say?

7. If he should have said to himself, No: for that the sentiment which he proposes as a standard must be grounded on reflection, let him say on what particulars the reflection is to turn? if on particulars having relation to the utility of the act, then let him say whether this is not deserting his own principle, and borrowing assistance from that very one in opposition to which he sets it up: or if not on those particulars, on what other particulars?

8. If he should be for compounding the matter, and adopting his own principle in part, and the principle of utility in part, let him say how far he will adopt it?

9. When he has settled with himself where he will stop, then let him ask himself how he justifies to himself the adopting it so far? and why he will not adopt it any farther?

10. Admitting any other principle than the principle of utility to be a right principle, a principle that it is right for a man to pursue; admitting (what is not true) that the word <right> can have a meaning without reference to utility, let him say whether there is any such thing as a <motive> that a man can have to pursue the dictates of it: if there is, let him say what that motive is, and how it is to be distinguished from those which enforce the dictates of utility: if not, then lastly let him say what it is this other principle can be good for?

* * * *

Chapter II: Of Principles Adverse To That Of Utility.

I. If the principle of utility be a right principle to be governed by, and that in all cases, it follows from what has been just observed, that whatever principle differs from it in any case must necessarily be a wrong one. To prove any other principle, therefore, to be a wrong one, there needs no more than just to show it to be what it is, a principle of which the dictates are in some point or other different from those of the principle of utility: to state it is to confute it.

II. A principle may be different from that of utility in two ways: 1. By being constantly opposed to it: this is the case with a principle which may be termed the principle of <asceticism>.[6] 2. By being sometimes opposed to it, and sometimes not, as it may happen: this is the case with another, which may be termed the principle of <sympathy> and <antipathy>.

III. By the principle of asceticism I mean that principle, which, like the principle of utility, approves or disapproves of any action, according to the tendency which it appears to have to augment or diminish the happiness of the party whose interest is in question; but in an inverse manner: approving of actions in as far as they tend to diminish his happiness; disapproving of them in as far as they tend to augment it.

IV. It is evident that any one who reprobates any the least particle of pleasure, as such, from whatever source derived, is <pro tanto> a partizan of the principle of asceticism. It is only upon that principle, and not from the principle of utility, that the most abominable pleasure which the vilest of malefactors ever reaped from his crime would be to be reprobated, if it stood alone. The case is, that it never does stand alone; but is necessarily followed by such a quantity of pain (or, what comes to the same thing, such a chance for a certain quantity of pain) that the pleasure in comparison of it, is as nothing: and this is the true and sole, but perfectly sufficient, reason for making it ground for punishment.

V. There are two classes of men of very different complexions, by whom the principle of asceticism appears to have been embraced; the one a set of moralists, the other a set of religionists. Different accordingly have been the motives which appear to have recommended it to the notice of these different parties. Hope, that is the prospect of pleasure, seems to have animated the former: hope, the aliment of philosophic pride: the hope of honour and reputation at the hands of men. Fear, that is the prospect of pain, the latter: fear, the offspring of superstitious fancy: the fear of future punishment at the hands of a splenetic and revengeful Deity. I say in this case fear: for of the invisible future, fear is more powerful than hope. These circumstances characterize the two different parties among the partizans of the principle of asceticism; the parties and their motives different, the principle the same.

VI. The religious party, however, appear to have carried it farther than the philosophical: they have acted more consistently and less wisely. The philosophical party have scarcely gone farther than to reprobate pleasure: the religious party have frequently gone so far as to make it a matter of merit and of duty to court pain. The philosophical party have hardly gone farther than the making pain a matter of indifference. It is no evil, they have said: they have not said, it is a good. They have not so much as reprobated all pleasure in the lump. They have discarded only what they have called the gross; that is, such as are organical, or of which the origin is easily traced up to such as are organical: they have even cherished and magnified the refined. Yet this, however, not under the name of pleasure: to cleanse itself from the sordes of its impure original, it was necessary it should change its name: the honourable, the glorious, the reputable, the becoming, the <honestum>, the <decorum>, it was to be called: in short, any thing but pleasure.

VII. From these two sources have flowed the doctrines from which the sentiments of the bulk of mankind have all along received a tincture of this principle; some from the philosophical, some from the religious, some from both. Men of education more frequently from the philosophical, as more suited to the elevation of their sentiments: the vulgar more frequently from the superstitious, as more suited to the narrowness of their intellect, undilated by knowledge: and to the abjectness of their condition, continually open to the attacks of fear. The tinctures, however, derived from the two sources, would naturally intermingle, insomuch that a man would not always know by which of them he was most influenced: and they would often serve to corroborate and enliven one another. It was this conformity that

made a kind of alliance between parties of a complexion otherwise so dissimilar: and disposed them to unite upon various occasions against the common enemy, the partizan of the principle of utility, whom they joined in branding with the odious name of Epicurean.

VIII. The principle of asceticism, however, with whatever warmth it may have been embraced by its partizans as a rule of private conduct, seems not to have been carried to any considerable length, when applied to the business of government. In few instances it has been carried a little way by the philosophical party: witness the Spartan regimen. Though then, perhaps, it maybe considered as having been a measure of security: and an application, though a precipitate and perverse application, of the principle of utility. Scarcely in any instances, to any considerable length, by the religious: for the various monastic orders, and the societies of the Quakers, Dumplers, Moravians, and other religionists, have been free societies, whose regimen no man has been astricted to without the intervention of his own consent. Whatever merit a man may have thought there would be in making himself miserable, no such notion seems ever to have occurred to any of them, that it may be a merit, much less a duty, to make others miserable: although it should seem, that if a certain quantity of misery were a thing so desirable, it would not matter much whether it were brought by each man upon himself, or by one man upon another. It is true, that from the same source from whence, among the religionists, the attachment to the principle of asceticism took its rise, flowed other doctrines and practices, from which misery in abundance was produced in one man by the instrumentality of another: witness the holy wars, and the persecutions for religion. But the passion for producing misery in these cases proceeded upon some special ground: the exercise of it was confined to persons of particular descriptions: they were tormented, not as men, but as heretics and infidels. To have inflicted the same miseries on their fellow believers and fellow-sectaries, would have been as blameable in the eyes even of these religionists, as in those of a partizan o the principle of utility. For a man to give himself a certain number of stripes was indeed meritorious: but to give the same number of stripes to another man, not consenting, would have been a sin. We read of saints, who for the good of their souls, and the mortification of their bodies, have voluntarily yielded themselves a prey to vermin: but though many persons of this class have wielded the reins of empire, we read of none who have set themselves to work, and made laws on purpose, with a view of stocking the body politic with the breed of highwaymen, housebreakers, or incendiaries. If at any time they have suffered the nation to be preyed upon by swarms of idle pensioners, or useless placemen, it has rather been from negligence and imbecility, than from any settled plan for oppressing and plundering of the people. If at any time they have sapped the sources of national wealth, by cramping commerce, and driving the inhabitants into emigration, it has been with other views, and in pursuit of other ends. If they have declaimed against the pursuit of pleasure, and the use of wealth, they have commonly stopped at declamation: they have not, like Lycurgas, made express ordinances for the purpose of banishing the precious metals. If they have established idleness by a law, it has been not because idleness, the mother of vice and misery, is itself a virtue, but because idleness (say they) is the road to holiness. If under the notion of fasting, they

have joined in the plan of confining their subjects to a diet, thought by some to be of the most nourishing and prolific nature, it has been not for the sake of making them tributaries to the nations by whom that diet was to be supplied, but for the sake of, manifesting their own power, and exercising the obedience of the people. If they have established, or Suffered to be established, punishments for the breach of celibacy, they have done no more than comply with the petitions of those deluded rigorists, who, dupes to the ambitious and deep-laid policy of their rulers, first laid themselves under that idle obligation by a vow.

IX. The principle of asceticism seems originally to have bee t the reverie of certain hasty speculators, who having perceived, or fancied, that certain pleasures, when reaped in certain circumstances, have, at the long run, been attended with pains more than equivalent to them, took occasion to quarrel with e thing that offered itself under the name of pleasure. Having then got thus far, and having forgot the point which they set out from, they pushed on, and went so much further as to think it meritorious to fall in love with pain. Even this, we see, is a bottom but the principle of utility misapplied.

X. The principle of utility is capable of being consistently pursued; and it is but tautology to say, that the more consistently it is pursued, the better it must ever be for humankind. The principle of asceticism never was, nor ever can be, consistently pursued by any living creature. Let but one tenth part of the inhabitants of this earth pursue it consistently, and in a day's time they will have turned it into a hell.

XI. Among principles adverse[7] to that of utility, that which at this day seems to have most influence in matters of government, is what may be called the principle of sympathy and antipathy. By the principle of sympathy and antipathy, I mean that principle which approves or disapproves of certain actions, not on account of their tending to augment the happiness, nor yet on account of their tending to diminish the happiness of the party whose interest is in question, but merely because a man finds himself disposed to approve or disapprove of them: holding up that approbation or disapprobation as a sufficient reason for itself, and disclaiming the necessity of looking out for any extrinsic ground. Thus far in the general department of morals: and in the particular department of politics, measuring out the quantum (as well as determining the ground) of punishment, by the degree of the disapprobation.

XII. It is manifest, that this is rather a principle in name than in reality: it is not a positive principle of itself, so much as a term employed to signify the negation of all principle. What one expects to find in a principle is something that points out some external consideration, as a means of warranting and guiding the internal sentiments of approbation and disapprobation: this expectation is but ill fulfilled by a proposition, which does neither more nor less than hold up each of those sentiments as a ground and standard for itself.

XIII. In looking over the catalogue of human actions (says a partizan of this principle) in order to determine which of them are to be marked with the seal of disapprobation, you need but to

take counsel of your own feelings: whatever you find in yourself a propensity to condemn, is wrong for that very reason. For the same reason it is also meet for punishment: in what proportion it is adverse to utility, or whether it be adverse to utility at all, is a matter that makes no difference. In that same <proportion> also is it meet for punishment: if you hate much, punish much: if you hate little, punish little: punish as you hate. I you hate not at all, punish not at all: the fine feelings of the soul are not to be overborne and tyrannized by the harsh and rugged dictates of political utility.

XIV. The various systems that have been formed concerning the standard of right and wrong, may all be reduced to the principle of sympathy and antipathy. One account may serve for all of them. They consist all of them in so many contrivances for avoiding the obligation of appealing to any external standard, and for prevailing upon the reader to accept of the author's sentiment or opinion as a reason for itself. The phrases different, but the principle the same.[8] XV. It is manifest, that the dictates of this principle will frequently coincide with those of utility, though perhaps without intending any such thing. Probably more frequently than not: and hence it is that the business of penal justice is carried on upon that tolerable sort of footing upon which we see it carried on in common at this day. For what more natural or more general ground of hatred to a practice can there be, than the mischievousness of such practice? What all men are exposed to suffer by, all men will be disposed to hate. It is far yet, however, from being a constant ground: for when a man suffers, it is not always that he knows what it is he suffers by. A man may suffer grievously, for instance, by a new tax, without being able to trace up the cause of his sufferings to the injustice of some neighbour, who has eluded the payment of an old one.

XVI. The principle of sympathy and antipathy is most apt to err on the side of severity. It is for applying punishment in many cases which deserve none: in many cases which deserve some, it is for applying more than they deserve. There is no incident imaginable, be it ever so trivial, and so remote from mischief, from which this principle may not extract a ground of punishment. Any difference in taste: any difference in opinion: upon one subject as well as upon another. No disagreement so trifling which perseverance and altercation Will not render serious. Each becomes in the other's eyes an enemy, and, if laws permit, a criminal.[9] This is one of the circumstances by which the human race is distinguished (not indeed to its advantage) from the brute creation. XVII. It is not, however, by any means unexampled for this principle to err on the side of lenity. A near and perceptible mischief moves antipathy. A remote and imperceptible mischief, though not less real, has no effect. Instances in proof of this will occur in numbers in the course of the work. It would be breaking in upon the order of it to give them here.

XVIII. It may be wondered, perhaps, that in all this no mention has been made of the <theological> principle; meaning that principle which professes to recur for the standard of right and wrong to the will of God. But the case is, this is not in fact a distinct principle. It is never any thing more or less than one or other of the three before-mentioned principles presenting itself under another shape. The <will> of God here

meant cannot be his revealed will, as contained in the sacred writings: for that is a system which nobody ever thinks of recurring to at this time of day, for the details of political administration: and even before it can be applied to the details of private conduct, it is universally allowed, by the most eminent divines of all persuasions, to stand in need of pretty ample interpretations; else to what use are the works of those divines? And for the guidance of these interpretations, it is also allowed, that some other standard must be assumed. The will then which is meant on this occasion, is that which may be called the <presumptive> will: that is to say, that which is presumed to be his will on account of the conformity of its dictates to those of some other principle. What then may be this other principle? it must be one or other of the three mentioned above: for there cannot, as we have seen, be any more. It is plain, therefore, that, setting revelation out of the question, no light can ever be thrown upon the standard of right and wrong, by any thing that can be said upon the question, what is God's will. We may be perfectly sure, indeed, that whatever is right is conformable to the will of God: but so far is that from answering the purpose of showing us what is right, that it is necessary to know first whether a thing is right, in order to know from thence whether it be conformable to the will of God .[10]   XIX. There are two things which are very apt to be confounded, but which it imports us carefully to distinguish:-the motive or cause, which, by operating on the mind of an individual, is productive of any act: and the ground or reason which warrants a legislator, or other bystander, in regarding that act with an eye of approbation. When the act happens, in the particular instance in question, to be productive of effects which we approve of, much more if we happen to observe that the same motive may frequently be productive, in other instances, of the like effects, we are apt to transfer our approbation to the motive itself, and to assume, as the just ground for the approbation we bestow on the act, the circumstance of its originating from that motive. It is in this way that the sentiment of antipathy has often been considered as a just ground of action. Antipathy, for instance, in such or such a case, is the cause of an action which is attended with good effects: but this does not make it a right ground of action in that case, any more than in any other. Still farther. Not only the effects are good, but the agent sees beforehand that they will be so. This may make the action indeed a perfectly right action: but it does not make antipathy a right ground of action. For the same sentiment of antipathy, if implicitly deferred to, may be, and very frequently is, productive of the very worst effects. Antipathy, therefore, can never be a right ground of action. No more, therefore, can resentment, which, as will be seen more particularly hereafter, is but a modification of antipathy. The only right ground of action, that can possibly subsist, is, after all, the consideration of utility, which, if it is a right principle of action, and of approbation, in any one case, is so in every other. Other principles in abundance, that is, other motives, may be the reasons why such and such an act has been done: that is, the reasons or causes of its being done: but it is this alone that can be the reason why it might or ought to have been done. Antipathy or resentment requires always to be regulated, to prevent its doing mischief: to be regulated by what? always by the principle of utility. The principle of utility neither requires nor admits of any other regulator than itself.

* * * *

Chapter III: Of The Four Sanctions Or Sources Of Pain And Pleasure.

I. It has been shown that the happiness of the individuals, of whom-a community is composed, that is their pleasures and their security, is the end and the sole end which the legislator ought to have in view: the sole standard, in conformity to which each individual ought, as far as depends upon the legislator, to be <made> to fashion his behaviour. But whether it be this or any thing else that is to be done, there is nothing by which a man can ultimately be <done> to do it, but either pain or pleasure. Having taken a general view of these two grand objects (viz. pleasure, and what comes to the same thing, immunity from pain) in the character of final causes; it will be necessary to take a view of pleasure and pain itself, in the character of <efficient> causes or means.

II. There are four distinguishable sources from which pleasure and pain are in use to flow: considered separately, they may be termed the <physical>, the <political>, the <moral>, and the <religious>: and inasmuch as the pleasures and pairs belonging to each of them are capable of giving a binding force to any law or rule of conduct, they may all of them be termed <sanctions>.[11] III If it be in the present life, and from the ordinary course of nature, not purposely modified by the interposition of the will of any human being, nor by any extraordinary interposition of any superior invisible being, that the pleasure or the pain takes place or is expected, it may be said to issue from or to belong to the <physical sanction>. IV. If at the hands of a <particular> person or set of persons in the community, who under names correspondent to that of <judge>, are chosen for the particular purpose of dispensing it, according to the will of the sovereign or supreme ruling power in the state, it may be said to issue from the <political sanction>.[12] V. If at the hands of such <chance> persons in the community, as the party in question may happen in the course of his life to have concerns with, according to each man's spontaneous disposition, and not according to any settled or concerted rule, it may be said to issue from the <moral> or <popular sanction>.

VI. If from the immediate hand of a superior invisible being, either in the present life, or in a future, it may be said to issue from the <religious sanctions>.

VII. Pleasures or pains which may be expected to issue from the <physical>, <political>, or <moral> sanctions, must all of them be expected to be experienced, if ever, in the <present> life: those which may be expected to issue from the <religious> sanction, may be expected to be experienced either in the <present> life or in a <future>.

VIII. Those which can be experienced in the present life, can of course be no others than such as human nature in the course of the present life is susceptible of: and from each of these sources may flow all the pleasures or pains of which, in the course of the present life, human nature is susceptible.

With regard to these then (with which alone we have in this place any concern) those of them which belong to any one of those sanctions, differ not ultimately in kind from those which belong to any one of the other three: the only difference there is among them lies in the circumstances that accompany their production. A suffering which befalls a man in the natural and spontaneous course of things, shall be styled, for instance, a <calamity>; in which case, if it be supposed to befall him through any imprudence of his, it may be styled a punishment issuing from the physical sanction. Now the same suffering, if inflicted by the law, will be what is commonly called a <punishment>; if incurred for want of any friendly assistance, which the misconduct, or supposed misconduct, of the sufferer has occasioned to be withholden, a punishment issuing from the <moral> sanction; if through the immediate interposition of a particular providence, a punishment issuing from the religious sanction.[13]   IX. A man's goods, or his person, are consumed by fire. If this happened to him by what is called an accident, it was a calamity: if by reason of his own imprudence (for instance, from his neglecting to put his candle out) it may be styled a punishment of the physical sanction: if it happened to him by the sentence of the political magistrate, a punishment belonging to the political sanction; that is, what is commonly called a punishment: if for want of any assistance which his <neighbour> withheld from him out of some dislike to his moral character, a punishment of the moral sanction: if by an immediate act of <God's> displeasure, manifested on account of some sin committed by him, or through any distraction of mind, occasioned by the dread of such displeasure, a punishment of the <religious> sanction.

X. As to such of the pleasures and pains belonging to the religious sanction, as regard a future life, of what kind these may be we cannot know. These lie not open to our observation. During the present life they are matter only of expectation: and, whether that expectation be derived from natural or revealed religion, the particular kind of pleasure or pain, if it be different from all those which lie open to our observation, is what we can have no idea of. The best ideas we can obtain of such pains and pleasures are altogether unliquidated in point of quality. In what other respects our ideas of them <may> be liquidated will be considered in another place.[14]   XI. Of these four sanctions the physicalis altogether, we may observe, the ground-work of the political and the moral: so is it also of the religious, in as far as the latter bears relation to the present life. It is included in each of those other three. This may operate in any case, (that is, any of the pains or pleasures belonging to it may operate) independently of <them>: none of the mean operate but by means of this. In a word, the powers of nature may operate of themselves; but neither the magistrate, nor men at large, can operate, nor is God in the case in question <supposed> to operate, but through the powers of nature.

XII. For these four objects, which in their nature have so much in common, it seemed of use to find a common name. It seemed of use, in the first place, for the convenience of giving a name to certain pleasures and pains, for which a name equally characteristic could hardly otherwise have been found: in the second place, for the sake of holding up the efficacy of certain moral forces, the influence of which is apt not to be sufficiently attended to. Does the political sanction exert an

influence over the conduct of mankind? The moral, the religious sanctions do so too. In every inch of his career are the operations Of the political magistrate liable to be aided or impeded by these two foreign powers: who, one or other of them, or both, are sure to be either his rivals or his allies. Does it happen to him to leave them out in his calculations? he will be sure almost to find himself mistaken in the result. Of an this we shall find abundant proofs in the sequel of this work. It behoves him, therefore, to have them continually before his eyes; and that under such a name as exhibits the relation they bear to his own purposes and designs.

* * * *

Chapter IV: Value Of A Lot Of Pleasure Or Pain, How To Be Measured.

I. Pleasures then, and the avoidance of pains, are the ends which the legislator has in view: it behoves him therefore to understand their <value>. Pleasures and pains are the <instruments> he has to work with: it behoves him therefore to understand their force, which is again, in other words, their value.

II. To a person considered <by himself>, the value of a pleasure or pain considered <by itself>, will be greater or less, according to the four following circumstances: [15] 1. Its <intensity>. 2. Its <duration>. 3. Its <certainty> or <uncertainty>. 4. Its <propinquity> or <remoteness>. III. These are the circumstances which are to be considered in estimating a pleasure or a pain considered each of the m by itself. But when the value of any pleasure or pain is considered for the purpose of estimating the tendency of any <act> by which it is produced, there are two other circumstances to be taken into the account; these are,

5. Its <fecundity>, or the chance it has of being followed by, sensations of the <same> kind: that is, pleasures, if it be a pleasure: pains, if it be a pain.

6. Its <purity>, or the chance it has of <not> being followed by, sensations of the <opposite> kind: that is, pains, if it be a pleasure: pleasures, if it be a pain.

These two last, however, are in strictness scarcely to be deemed properties of the pleasure or the pain itself; they are not, therefore, in strictness to be taken into the account of the value of that pleasure or that pain. They are in strictness to be deemed properties only of the act, or other event, by which such pleasure or pain has been produced; and accordingly are only to be taken into the account of the tendency of such act or such event.

IV. To a <number> of persons, with reference to each of whom the value of a pleasure or a pain is considered, it will be greater or less, according to seven circumstances: to wit, the six preceding ones; <viz>.

1. Its <intensity>.

2. Its <duration>.

3. Its <certainty> or <uncertainty>.

4. Its <propinquity> or <remoteness>.

5. Its <fecundity>.

6. Its <purity>.

And one other; to wit:

7. Its <extent>; that is, the number of persons to whom it extends; or (in other words) who are affected by it.

V. To take an exact account then of the general tendency of any act, by which the interests of a community are affected, proceed as follows. Begin with any one person of those whose interests seem most immediately to be affected by it: and take an account,

1. Of the value of each distinguishable <pleasure> which appears to be produced by it in the <first> instance.

2. Of the value of each <pain> which appears to be produced by it in the <first> instance.

3. Of the value of each pleasure which appears to be produced by it <after> the first. This constitutes the <fecundity> of the first <pleasure> and the <impurity> of the first pain.

4. Of the value of each pain which appears to be produced by it after the first. This constitutes the <fecundity> of the first <pain>, and the <impurity> of the first pleasure.

5. Sum up all the values of all the pleasures on the one side, and those of all the pains on the other. The balance, if it be on the side of pleasure, will give the <good> tendency of the act upon the whole, with respect to the interests of that <individual> person; if on the side of pain, the bad tendency of it upon the whole.

6. Take an account of the <number> of persons whose interests appear to be concerned; and repeat the above process with respect to each. <Sum up> the numbers expressive of the degrees of <good> tendency, which the act has, with respect to each individual, in regard to whom the tendency of it is <good> upon the whole: do this again with respect to each individual, in regard to whom the tendency of it is <good> upon the whole: do this again with respect to each individual, in regard to whom the tendency of it is <bad> upon the whole. Take the <balance>; which, if on the side of <pleasure>, will give the general <good tendency> of the act, with respect to the total number or community of individuals concerned; if on the side of pain, the general <evil tendency>, with respect to the same community.

VI. It is not to be expected that this process should be strictly pursued previously to every moral judgment, or to every legislative or judicial operation. It may, however, be always kept in view: and as near as the process actually pursued on these occasions approaches to it, so near will such process

approach to the character of an exact one.

VII. The same process is alike applicable to pleasure and pain, in whatever shape they appear: and by whatever denomination they are distinguished: to pleasure, whether it be called <good> (which is properly the cause or instrument of pleasure) or <profit> (which is distant pleasure, or the cause or instrument o distant pleasure,) or <convenience>, or <advantage>, <benefit>, <emolument>, <happiness>, and so forth: to pain, whether it be called <evil>, (which corresponds to good) or <mischief>, or <inconvenience>, or <disadvantage>, or <loss>, or <unhappiness>, and so forth.

VIII. Nor is this a novel and unwarranted, any more than it is a useless theory. In all this there is nothing but what the practice of mankind, wheresoever they have a clear view of their own interest, is perfectly conformable to. An article of property, an estate in land, for instance, is valuable, on what account? On account of the pleasures of all kinds which it enables a man to produce, and what comes to the same thing the pains of all kinds which it enables him to avert. But the value of such an article of property is universally understood to rise or fall according to the length or shortness of the time which a man has in it: the certainty or uncertainty of its coming into possession: and the nearness or remoteness of the time at which, if at all, it is to come into possession. As to the <intensity> of the pleasures which a man may derive from it, this is never thought of, because it depends upon the use which each particular person may come to make of it; which cannot be estimated till the particular pleasures he may come to derive from it, or the particular pains he may come to exclude by means of it, are brought to view. For the same reason, neither does he think of the <fecundity> or <purity> of those pleasures.

Thus much for pleasure and pain, happiness and unhappiness, in <general>. We come now to consider the several particular kinds of pain and pleasure.

* * * *

Notes

[2]Note by the Author, July 1822. To this denomination has of late been added, or substituted, the <greatest happiness> or <greatest felicity> principle: this for shortness, instead of saying at length <that principle> which states the greatest happiness of all those whose interest is in question, as being the right and proper, and only right and proper and universally desirable, end of human action: of human action in every

situation, and in particular in that of a functionary or set of functionaries exercising the powers of Government. The word <utility> does not so clearly point to the ideas of <pleasure> and <pain> as the words <happiness> and <felicity> do: nor does it lead us to the consideration of the <number>, of the interests affected; to the <number>, as being the circumstances, which contributes, in the largest proportion, to the formation of the standard here in question; the <standard of right and wrong>, by which alone the propriety of human conduct, in every situation, can with propriety be tried. This want of a sufficiently manifest connexion between the ideas of <happiness> and <pleasure> on the one hand, and the idea of <utility> on the other, I have every now and then found operating, and with but too much efficiency, as a bar to the acceptance, that might otherwise have been given, to this principle.

[3]The word principle is derived from the Latin principium: which seems to be compounded of the two words, <primus>, first, or chief, and <cipium>, a termination which seems to be derived from <capio>, to take, as in <mancipium, municipium>; to which are analogous, <auceps, forceps>, and others. It is a term of very vague and very extensive signification: it is applied to any thing which is conceived to serve as a foundation or beginning to any series of operations: in some cases, of physical operations; but of mental operations in the present case.

The principle here in question may be taken for an act of the mind; a sentiment; a sentiment of approbation; a sentiment which, when applied to an action, approves of its utility, as that quality of it by which the measure of approbation or disapprobation bestowed upon it ought to be governed.

[4]Interest is one of those words, which not having any superior genus, cannot in the ordinary way be defined. [5]'The principle of utility (I have heard it said) is a dangerous principle: it is dangerous on certain occasions to consult it.' This is as much as to say, what? that it is not consonant to utility, to consult utility: in short, that it is <not> consulting it, to consult it.

Addition by the Author, July 1822.

Not long after the publication of the Fragment on Government, anno 1776, in which in the character of an all-comprehensive and all-commanding principle, the principle of <utility> was brought to view, one person by whom observation to the above effect was made was <Alexander Wedderburn>, at that time Attorney or Solicitor General, afterwards successively Chief Justice of the Common Pleas, and Chancellor of England, under the successive titles of Lord Loughborough and Earl of Rosslyn. It was made -- not indeed in my hearing, but in the hearing of a person by whom it was almost immediately communicated to me. So far from being self-contradictory, it was a shrewd and perfectly true one. By that distinguished functionary, the state of the Government was thoroughly understood: by the obscure individual, at that time not so much as supposed to be so: his disquisitions had not been as yet applied, with any thing like a comprehensive view, to the field of Constitutional Law, nor therefore to those features of the English Government, by which the greatest happiness of the ruling <one> with or without that of a favoured few, are now so plainly seen to be the only ends to which the

course of it has at any time been directed. The <principle of utility> was an appellative, at that time employed -- employed by me, as it had been by others, to designate that which, in a more perspicuous and instructive manner, may, as above, be designated by the name of the <greatest happiness principle>. 'This principle (said Wedderburn) is a dangerous one" Saying so, he said that which, to a certain extent, is strictly true: a principle, which lays down, as the only <right> and justifiable end of Government, the greatest happiness of the greatest number -- how can it be denied to be a dangerous one? dangerous it unquestionably is, to every government which has for its <actual> end or object, the greatest happiness of a certain <one>, with or without the addition of some comparatively small number of others, whom it is matter of pleasure or accommodation to him to admit, each of them, to a share in the concern, on the footing of so many junior partners. <Dangerous> it therefore really was, to the interest -- the sinister interest -- of all those functionaries, himself included, whose interest it was, to maximize delay, vexation, and expense, in judicial and other modes of procedure, for the sake of the profit, extractable out of the expense. In a Government which had for its end in view the greatest happiness of the greatest number, Alexander Wedderburn might have been Attorney general and then Chancellor: but he would not have been Attorney General with L15,000 a year, nor chancellor, with a peerage with a veto upon all justice, with L25,000 a year, and with 500 sinecures at his disposal, under the name of Ecclesiastical Benefices, besides <et caeteras>.

[6]Ascetic is a term that has been sometimes applied to Monks. It comes from a Greek word which signifies exercise. The practices by which Monks sought to distinguish themselves from other men were called their Exercises. These exercises consisted in so many contrivances they had for tormenting themselves. By this they thought to ingratiate themselves with the Deity. For the Deity, said they, is a Being of infinite benevolence: now a Being of the most ordinary benevolence is pleased to see others make themselves as happy as they can: therefore to make ourselves as unhappy as we can is the way to please the Deity. If any body asked them, what motive they could find for doing all this? Oh! said they, you are not to imagine that we are punishing ourselves for nothing: we know very well what we are about. You are to know, that for every grain of pain it costs us now, we are to have a hundred grains of pleasure by and by. The case is, that God loves to see us torment ourselves at present: indeed he has as good as told us so. But this is done only to try us, in order just to see how we should behave: which it is plain he could not know, without making the experiment. Now then, from the satisfaction it gives him to see us make ourselves as unhappy as we can make ourselves in this present life, we have a sure proof of the satisfaction it will give him to see us as happy as he can make us in a life to come.

[7]The following Note was first printed in January 1789.

It ought rather to have been styled, more extensively, the principle of <caprice>. Where it applies to the choice of actions to be marked out for injunction or prohibition, for reward or punishment, (to stand, in a word, as subjects for obligations to be imposed,) it may indeed with propriety be termed, as in the text, the principle of <sympathy> and <antipathy>. But this appellative does not so well apply to it,

when occupied in the choice of the <events> which are to serve as sources of <title> with respect to <rights>: where the actions prohibited and allowed the obligations and rights, being already fixed, the only question is, under what circumstances a man is to be invested with the one or subjected to the other? from what incidents occasion is to be taken to invest a man, or to refuse to invest him, with the one, or to subject him to the other? from what incidents occasion is to be taken to invest a man, or to refuse to invest him, with the one, or to subject him to the other? from what incidents occasion is to be taken to invest a man, or to refuse to invest him, with the one, or to subject him to the other? In this latter case it may more appositely be characterized by the name of the <phantastic principle>. Sympathy and antipathy are affections of the <sensible> faculty. But the choice of <titles> with respect to <rights>, especially with respect to proprietary rights, upon grounds unconnected with utility, has been in many instances the work, not of the affections but of the imagination.

When, in justification of an article of English Common Law, calling uncles to succeed in certain cases in preference to fathers, Lord Coke produced a sort of ponderosity he had discovered in rights, disqualifying them from ascending in a straight line, it was not that he <loved> uncles particularly, or <hated> fathers, but because the analogy, such as it was, was what his imagination presented him with, instead of a reason, and because, to a judgment unobservant of the standard of utility, or unacquainted with the art of consulting it, where affection is out of the way, imagination is the only guide.

When I know not what ingenious grammarian invented the proposition <Delegatus non potest delegare>, to serve as a rule of law, it was not surely that he had any antipathy to delegates of the second order, or that it was any pleasure to him to think of the ruin which, for want of a manager at home, may befall the affairs of a traveller, whom an unforeseen accident has deprived of the object of his choice: it was, that the incongruity, of giving the same law to objects so contrasted as <active> and <passive> are, was not to be surmounted, and that <-atus> chimes, as well as it contrasts, with <-are>.

When that inexorable maxim, (of which the dominion is no more to be defined, than the date of its birth, or the name of its father, is to be found,) was imported from England for the government of Bengal, and the whole thunders of <ex post facto> justice, it blameless magistracy perishing in the unoffended authors of their misery; absorbing the whole imagination, had drowned the cries of humanity along with the dictates of common sense. <Fiat Justitia, ruat caelum>, says another maxim, as full of extravagance as it is of harmony: Go heaven to wreck -- so justice be but done: -- and what is the ruin of kingdoms, in comparison of the wreck of heaven?

So again, when the Prussian chancellor, inspired with the wisdom of I know not what Roman sage, proclaimed in good Latin, for the edification of German ears, <Servitus servitutis non datur>, [Cod. Fred. tom. ii. par. 2. liv. 2 tit. x. sect 6. p. 308.] it was not that he had conceived any aversion to the life-holder who, during the continuance of his term, should wish to gratify a neighbour with a right of way or water, or to the neighbour who should wish to accept of the indulgence; but that,

to a jurisprudential ear, <-tus -tutis> sound little less melodious than <-atus -are>. Whether the melody of the maxim was the real reason of the rule, is not left open to dispute: for it is ushered in by the conjunction <quia>, reason's appointed harbinger: <quia servitus servitutis non datur>.

Neither would equal melody have been produced, nor indeed could similar melody have been called for, in either of these instances, by the n they are opposed to general rules, and are absorbed in them, that more specific ones can obtain a separate existence. <Delegatus potest delegare>, and <Servitus servitutis datur> provisions already included under the general adoption of contracts, would have been as unnecessary to the apprehension and the memory, as, in comparison of their energetic negatives, they are insipid to the ear.

Were the inquiry diligently made, it would be found that the goddess of harmony has exercised more influence, however latent, over the dispensations of Themis, than her most diligent historiographers, or even her most passionate panegyrists, seem to have been aware of. Every one knows how, by the ministry of Orpheus, it was she who first collected the sons of men beneath the shadow of the sceptre: yet, in the midst of continual experience, men seem yet to learn, with what successful diligence she has laboured to guide it in its course. Every one knows, that measured numbers were the language of the infancy of law: none seem to have observed, with what imperious sway they have governed her maturer age. In English jurisprudence in particular, the connexion betwixt law and music, however less perceived than in Spartan legislation, is not perhaps less real nor less close. the music of the Office, though not of the same kind, is not less musical in its kind, than the music of the Theatre; that which hardens the heart, than that which softens it: -- sostenutos as long, cadences as sonorous; and those governed by rules, though not yet promulgated, not less determinate. Search indictments, pleadings, proceedings in chancery, conveyances: whatever trespasses you may find against truth or common sense, you will find none against the laws of harmony. The English Liturgy, justly as this quality has been extolled in that sacred office, possesses not a greater measure of it, than is commonly to be found in an English Act of Parliament. Dignity, simplicity, brevity, precision, intelligibility, possibility of being retained or so much as apprehended. every thing yields to Harmony. Volumes might be filled, shelves loaded, with the sacrifices that are made to this insatiate power. Expletives her ministers in Grecian poetry are not less busy, though in different shape and bulk, in English legislation: in the former, they are monosyllables: in the latter, they are whole lines.

To return to the <principle of sympathy and antipathy>: a term preferred at first, on account of its impartiality, to the <principle of caprice>. The choice of an appellative, in the above respects too narrow, was owing to my not having , at that time, extended my views over the civil branch of law, any otherwise than as I had found it inseparably involved in the penal. But when we come to the former branch, we shall see the <phantastic> principle making at least as great a figure there, as the principle of <sympathy and antipathy> in the latter.

In the days of Lord Coke, the light of utility can scarcely be said to have as yet shone upon the face of Common Law. If a

faint ray of it, under the name of the <argumentum ad inconvenienti>, is to be found in a list of about twenty topics exhibited by that great lawyer as the co-ordinate leaders of that all-perfect system, the admission, so circumstanced, is as sure a proof of neglect, as to the statues of Brutus and Cassius, exclusion was a cause of notice. It stands, neither in the front nor in the rear, nor in any post of honour; but huddled in towards the middle, without the smallest mark of preference [Coke, Littleton, II. a.] Nor is this Latin <inconvenience> by any means the same thing with the English one. It stands distinguished from <mischief>: and because by the vulgar it is taken for something less bad, it is given by the learned as something worse. <The law prefers a mischief to an inconvenience>, says an admired maxim, and the more admired, because as nothing is expressed by it, the more is supposed to be understood.

Not that there is any avowed, much less constant opposition, between the prescriptions of utility and the operations of the common law: such constancy we have seen to be too much even for ascetic fervor. [Supra, par. x] From time to time instinct would unavoidably betray them into the paths of reason: instinct which, however it may be cramped, can never be killed by education. the cobwebs spun out of the materials brought together by 'the competition of opposite analogies,' can never have ceased being warped by the silent attraction of the rational principle: though it should have been, as the needle is by the magnet, without the privity of conscience.

[8]It is curious enough to observe the variety of inventions men have hit upon, and the variety of phrases they have brought forward, in order conceal from the world and, if possible, from themselves this very and therefore very pardonable self-sufficiency.

1. One man says, he has a thing made on purpose to tell him what is right and what is wrong; and that it is called a <moral sense>: and then goes to work at his ease, and says, such a thing is right, and such a thing is wrong -- why? 'because my moral sense tells me it is.'

2. Another man comes and alters the phrase: leaving out <moral> and putting in common, in the room of it. He then tells you that his common sense teaches him what is right and wrong, as surely as the other's moral sense did: meaning by common sense, a sense of some kind or other, which, he says, is possessed by all mankind: the sense of those, whose sense is not the same as the author's being struck out of the account as not worth taking. This contrivance does better than the other; for a moral sense, being a new thing, a man may feel about him a good while without being able to find it out: but common sense is as old as the creation; and there is no man but would be ashamed to be thought not to have as much of it as his neighbours. It has another great advantage: by appearing to share power, it lessens envy: for when a man gets up upon this ground, in order to anathematize those who differ from him, it is not by a <sic volo sic jubeo>, but by a <velitis jubeatis>.

3. Another man comes, and says, that as to a moral sense indeed, he cannot find that he has any such thing : that however he has an <understanding>, which will do quite as well. This

understanding, he says, is the standard of right and wrong: it tells him so and so. All good and wise men understand as he does: if other men's understandings differ in any point from his, so much the worse for them: it is a sure sign they are either defective or corrupt.

4. Another man says, that there is an eternal and immutable Rule of Right: that that rule of right dictates so and so: and then he begins giving you his sentiments upon any thing that comes uppermost: and these sentiments (you are to take for granted) are so many branches of the eternal rule of right.

5. Another man, or perhaps the same man (it's no matter) says, that there are certain practices conformable, and others repugnant, to the fitness of things; and then he tells you, at his leisure, what practices are conformable and what repugnant: just as he happens to like a practice or dislike it.

6. A great multitude of people we continually talking of the Law of Nature; and then they go on giving you their sentiments about what is right and what is wrong: and these sentiments, you are to understand, are so many chapters and sections of the Law of Nature.

7. Instead of the phrase, Law of Nature, you have sometimes, Law of Reason, Right Reason, Natural Justice, Natural Equity, Good Order. Any of them will do equally well. this latter is most used in politics. The three last are much more tolerable than the others, because they do not very explicitly claim to be any thing more than phrases: they insist but feebly upon the being looked upon as so many positive standards of themselves, and seem content to be taken, upon occasion, for phrases expressive of the conformity of the thing in question to the proper standard, whatever that may be. On most occasions, however, it will be better to say <utility: utility> is clearer, as referring more explicitly to pain and pleasure.

8. We have one philosopher, who says, there is no harm in any thing in the world but in telling a lie: and that if, for example, you were to murder your own father, this would not only be a particular way of saying, he was not your father. Of course, when this philosopher sees any thing that he does not like, he says, it is a particular way of telling a lie. It s saying, that the act ought to be done, or may be done, when, <in truth>, it ought not to be done.

9. The fairest and openest of them all is that sort of man who speaks out and says, I am of the number of the Elect: now God himself takes care to inform the Elect what is right: and that with so good effect, and let them strive ever so, they cannot help not only knowing it but practising it. If therefore a man wants to know what is right and what is wrong, he has nothing to do but to come to me.

It is upon the principle of antipathy that such and such acts are often reprobated on the score of their being <unnatural>: the practice of exposing children, established among the Greeks and Romans, was an unnatural practice. Unnatural, when it means any thing, means unfrequent: and there it means something; although nothing to the present purpose. But here it means no such thing: for the frequency of such acts is perhaps

the great complaint. It therefore means nothing; nothing, I mean, which there is in the act itself. All it can serve to express is, the disposition of the person who is talking of it: the disposition he is in to be angry at the thoughts of it. Does it merit his anger? very likely it may: but whether it does or no is a question, which, to be answered rightly, can only be answered upon the principle of utility.

Unnatural, is as good a word as moral sense, or common sense; and would be as good a foundation for a system. such an act is unnatural; that is, repugnant to nature: for I do not like to practise it: and, consequently, do not practise it. It is therefore repugnant to what ought to be the nature of every body else.

The mischief common to all these ways of thinking and arguing (which, in truth, as we have seen, are but one and the same method, couched in different forms of words) is their serving as a cloke, and pretence, and aliment, to despotism: if not a despotism in practice, a despotism however in disposition: which is but too apt, when pretence and power offer, to show itself in practice. The consequence is, that with intentions very commonly of the purest kind, a man becomes a torment either to himself or his fellow-creatures. If he be of the melancholy cast, he sits in silent grief, bewailing their blindness and depravity: if of the irascible, he declaims with fury and virulence against all who differ from him; blowing up the coals of fanaticism, and branding with the charge of corruption and insincerity, every man who does not think, or profess to think, as he does.

If such a man happens to possess the advantages of style, his book may do a considerable deal of mischief before the nothingness of it is understood.

These principles, if such they can be called, it is more frequent to see applied to morals than to politics: but their influence extends itself to both. In politics, as well as morals, a man will be at least equally glad of a pretence for deciding any question in the manner that best pleases him, without the trouble of inquiry. If a man is an infallible judge of what is right and wrong in the actions of private individuals, why not in the measures to be observed by public men in the direction of those actions? accordingly (not to mention other chimeras) I have more than once known to pretended law of nature set up in legislative debates, in opposition to arguments derived from the principle of utility.

'But is it never, then, from any other considerations than those of utility, that we derive our notions of right and wrong?' I do not know: I do not care. Whether a moral sentiment can be originally conceive from any other source than a view of utility, is one question: whether upon examination and reflection it can, in point of fact, be actually persisted in and justified on any other ground, by a person reflecting within himself, is another: whether in point of right it can properly be justified on any other ground, by a person addressing himself to the community, is a third. The two first are questions of speculation: it matters not, comparatively speaking, how they are decided. The last is a question of practice: the decision of it is of as much importance as that of any can be.

'I feel in myself,' (say you) 'a disposition to approve of such or such an action in a moral view: but this is not owing to any notions I have of its being a useful one to the community. I do not pretend to know whether it be an useful one or not: it may be, for aught I know, a mischievous one." "But is it then,' (say I) 'a mischievous one? examine; and if you can make yourself sensible that it is so, then, if duty means any thing, that is, moral duty, it is your <duty> at least to abstain from it: and more than that, if it is what lies in your power, and can be done without too great a sacrifice, to endeavour to prevent it. It is not your cherishing the notion of it in your bosom, and giving it the name of virtue, that will excuse you.'

'I feel in myself' (say you again) 'a disposition to detest such or such an action in a moral view; but this is not owing to any notions I have of its being a mischievous one to the community. I do not pretend to know whether it be a mischievous one or not: it may be not a mischievous one: it may be, for aught I know, an useful one.' -- 'May it indeed,' (say I) 'an useful one? but let me tell you then, that unless duty, and right and wrong, be just what you please to make them, if it really be not a mischievous one, and any body has a mind to do it, it is no duty of yours, but, on the contrary, it would be very wrong in you, to take upon you to prevent him: detest it within yourself as much as you please; that may be a very good reason (unless it be also a useful one) for your not doing it yourself: but if you go about, by word or deed, to do any thing to hinder him, or make him suffer for it, it is you, and not he, that have done wrong: it is not your setting yourself to blame his conduct, or branding it with the name of vice, that will make him culpable, or you blameless. Therefore, if you can make yourself content that he shall be of one mind, and you of another, about that matter, and so continue, it is well: but if nothing will serve you, but that you and he must needs e of the same mind, I'll tell you what you have to do: it is for you to get the better of your antipathy, not for him to truckle to it.'

[9]King James the First of England had conceived a violent antipathy against Arians: two of whom he burnt (Hume's Hist. Vol. 6). This gratification he procured himself without much difficulty: the notions of the times were favourable to it. He wrote a furious book against Vorstius, for being what was called an Arminian: for Vorstius was at a distance. He also wrote a furious book, called 'A Counterblast to Tobacco,' against the use of that drug, which Sir Walter Raleigh had then lately introduced. Had the notions of the times co-operated with him, he would have burnt the Anbaptist and the smoker of tobacco in the same fire. However he had the satisfaction of putting Raleigh to death afterwards, though for another crime.

Disputes concerning the comparative excellence of France and Italian music have occasioned very serious bickerings at Paris. One of the parties would not have been sorry (say Mr. D'Alembert [Melanges Essai sur la Liberte de la Musique.]) to have brought government into the quarrel. Pretences were sought after and urged. Long before that, a dispute of like nature, and of at least equal warmth, had been kindled at London upon the comparative merits of two composers at London; where riots between the approvers and disapprovers of a new play are, at this day, not unfrequent. The ground of quarrel between the Big-

endians and Little-endians in the fable, was not more frivolous than many an one which has laid empires desolate. In Russia, it is said, there was a time when some thousands of persons lost their lives in a quarrel, in which the government had taken part, about the number of fingers to be used in making the sign of the cross. This was in days of yore: the ministers of Catherine II. are better <instructed> (Instruct. art. 474. 475, 476) than to take any other part in such disputes, than that of preventing the parties concerned from doing one another a mischief.

[10]The principle of theology refers every thing to God's pleasure. But what is God's pleasure? God does not, he confessedly does not now, either speak or write to us. How then are we to know what is his pleasure? By observing what is our own pleasure, and pronouncing it to be his. Accordingly, what is called the pleasure of god, is and must necessarily be (revelation apart) neither more nor less than the good pleasure of the person, whoever he be, who is pronouncing what he believes, or pretends, to be God's pleasure. How know you it to be God's pleasure that such or such an act should be abstained from? whence come you even to suppose as much? "Because the commission of it is attended with a gross and sensual, or at least with a trifling and transient satisfaction;' says the partizan of the principle of asceticism: 'Because I detest the thoughts of it; and I cannot, neither ought I to be called upon to tell why;' says he who proceeds upon the principles of antipathy. In the words of one or other of these must that persons necessarily answer (revelation apart) who professes to take for his standard the will of God.

[11]Sanctio, in Latin, was used to signify the <act of binding>, and, by a common grammatical transition, <any thing which serves to bind a man>: to wit, to the observance of such or such a mode of conduct. According to a Latin grammarian (Servius. See Ainsworth's Dict. ad verbum <Sanctio>.), the import of the word is derived by rather a far-fetched process (such as those commonly are, and in a great measure indeed must be, by which intellectual ideas are derived from sensible ones) from the word <sanguis>, blood: because, among the Romans, with a view to inculcate into the people a persuasion that such or such a mode of conduct would be rendered obligatory upon a man by the force of what I call the religious sanction (that is, that he would be made to suffer by the extraordinary interposition of some superior being, if he failed to observe the mode of conduct in question) certain ceremonies were contrived by the priests: in the course of which ceremonies the blood of victims was made use of.

A Sanction then is a source of obligatory powers or <motives>: that is, of <pains> and <pleasures>; which, according as they are connected with such or such modes of conduct, operate, and are indeed the only things which can operate, as <motives>. See Chap. X. [Motives].

[12]Better termed <popular>, as more directly indicative of its constituent cause; as likewise of its relation to the more common phrase <public opinion>, in French <opinion publique>, the name there given to that tutelary power, of which of late so much is said, and by which so much is done. The latter appellation is however unhappy and inexpressive; since if <opinion> is material, it is only in virtue of the influence it exercises over action,

through the medium of the affections and the will.

[13]A suffering conceived to befall a man by the immediate act of God, as above, is often, for shortness' sake, called a <judgment>: instead of saying a suffering inflicted on him in consequence of a special judgment formed, and resolution thereupon taken, by the Deity. [14]See ch. xii. [Cases unmeet] par. 2. note. [15]These circumstances have since been dominated <elements> or <dimensions of value> in a pleasure or a pain.

Nor long after the publication of the first edition, the following memoriter verses were framed, in the view of lodging more effectually, in the memory, these points, on which the whole fabric of morals and legislation may be seen to rest.

<Intense, long, certain, speedy, fruitful, pure> --
Such marks in <pleasures> and in <pains> endure.
Such pleasures seek if <private> be thy end:
If it be <public>, wide let them <extend>.
Such <pains> avoid, whichever by thy view:
If pains <must> come, let them <extend> to few.

A Treatise Concerning the Principles of Human Knowledge

George Berkeley

1710

7/20/96

Editor's Note: This e-text is based on the Virginia Tech Eris project text of Berkeley's Principles. This slightly modified text version and associated HTML files were prepared for the Internet Encyclopedia of Philosophy (jfieser@utm.edu).

CONTENTS

Dedication

To the Right Honourable Thomas, Earl of Pembroke, &C., Knight of the most Noble Order of the Garter and one of the Lords of Her Majesty's most honourable privy council .

My Lord,

You will perhaps wonder that an obscure person, who has not the honour to be known to your lordship, should presume to address you in this manner. But that a man who has written something with a design to promote Useful Knowledge and Religion in the world should make choice of your lordship for his patron, will not be thought strange by any one that is not altogether unacquainted with the present state of the church and learning, and consequently ignorant how great an ornament and support you are to both. Yet, nothing could have induced me to make you

this present of my poor endeavours, were I not encouraged by that candour and native goodness which is so bright a part in your lordship's character. I might add, my lord, that the extraordinary favour and bounty you have been pleased to show towards our Society gave me hopes you would not be unwilling to countenance the studies of one of its members. These considerations determined me to lay this treatise at your lordship's feet, and the rather because I was ambitious to have it known that I am with the truest and most profound respect, on account of that learning and virtue which the world so justly admires in your lordship, MY LORD, Your lordship's most humble and most devoted servant, GEORGE BERKELEY

Preface

WHAT I here make public has, after a long and scrupulous inquiry, seemed to me evidently true and not unuseful to be known- particularly to those who are tainted with Scepticism, or want a demonstration of the existence and immateriality of God, or the natural immortality of the soul. Whether it be so or no I am content the reader should impartially examine; since I do not think myself any farther concerned for the success of what I have written than as it is agreeable to truth. But, to the end this may not suffer, I make it my request that the reader suspend his judgment till he has once at least read the whole through with that degree of attention and thought which the subject-matter shall seem to deserve. For, as there are some passages that, taken by themselves, are very liable (nor could it be remedied) to gross misinterpretation, and to be charged with most absurd consequences, which, nevertheless, upon an entire perusal will appear not to follow from them; so likewise, though the whole should be read over, yet, if this be done transiently, it is very probable my sense may be mistaken; but to a thinking reader, I flatter myself it will be throughout clear and obvious. As for the characters of novelty and singularity which some of the following notions may seem to bear, it is, I hope, needless to make any apology on that account. He must surely be either very weak, or very little acquainted with the sciences, who shall reject a truth that is capable of demonstration, for no other reason but because it is newly known, and contrary to the prejudices of mankind. Thus much I thought fit to premise, in order to prevent, if possible, the hasty censures of a sort of men who are too apt to condemn an opinion before they rightly comprehend it.

Introduction

1. Philosophy being nothing else but the study of wisdom and truth, it may with reason be expected that those who have spent most time and pains in it should enjoy a greater calm and serenity of mind, a greater clearness and evidence of knowledge, and be less disturbed with doubts and difficulties than other men. Yet so it is, we see the illiterate bulk of mankind that walk the high-road of plain common sense, and are governed by the dictates of nature, for the most part easy and undisturbed. To them nothing that is familiar appears unaccountable or difficult to comprehend. They complain not of any want of evidence in their senses, and are out of all danger of becoming Sceptics. But no sooner do we depart from sense and instinct to follow the light of a

superior principle, to reason, meditate, and reflect on the nature of things, but a thousand scruples spring up in our minds concerning those things which before we seemed fully to comprehend. Prejudices and errors of sense do from all parts discover themselves to our view; and, endeavouring to correct these by reason, we are insensibly drawn into uncouth paradoxes, difficulties, and inconsistencies, which multiply and grow upon us as we advance in speculation, till at length, having wandered through many intricate mazes, we find ourselves just where we were, or, which is worse, sit down in a forlorn Scepticism.

2. The cause of this is thought to be the obscurity of things, or the natural weakness and imperfection of our understandings. It is said, the faculties we have are few, and those designed by nature for the support and comfort of life, and not to penetrate into the inward essence and constitution of things. Besides, the mind of man being finite, when it treats of things which partake of infinity, it is not to be wondered at if it run into absurdities and contradictions, out of which it is impossible it should ever extricate itself, it being of the nature of infinite not to be comprehended by that which is finite.

3. But, perhaps, we may be too partial to ourselves in placing the fault originally in our faculties, and not rather in the wrong use we make of them. It is a hard thing to suppose that right deductions from true principles should ever end in consequences which cannot be maintained or made consistent. We should believe that God has dealt more bountifully with the sons of men than to give them a strong desire for that knowledge which he had placed quite out of their reach. This were not agreeable to the wonted indulgent methods of Providence, which, whatever appetites it may have implanted in the creatures, doth usually furnish them with such means as, if rightly made use of, will not fail to satisfy them. Upon the whole, I am inclined to think that the far greater part, if not all, of those difficulties which have hitherto amused philosophers, and blocked up the way to knowledge, are entirely owing to ourselves- that we have first raised a dust and then complain we cannot see.

4. My purpose therefore is, to try if I can discover what those Principles are which have introduced all that doubtfulness and uncertainty, those absurdities and contradictions, into the several sects of philosophy; insomuch that the wisest men have thought our ignorance incurable, conceiving it to arise from the natural dulness and limitation of our faculties. And surely it is a work well deserving our pains to make a strict inquiry concerning the First Principles of Human Knowledge, to sift and examine them on all sides, especially since there may be some grounds to suspect that those lets and difficulties, which stay and embarrass the mind in its search after truth, do not spring from any darkness and intricacy in the objects, or natural defect in the understanding, so much as from false Principles which have been insisted on, and might have been avoided.

5. How difficult and discouraging soever this attempt may seem, when I consider how many great and extraordinary men have gone before me in the like designs, yet I am not without some hopes- upon the consideration that the largest views are not always the clearest, and that he who is short-sighted will be obliged to draw the object nearer, and may, perhaps, by a close and narrow survey, discern that which had escaped far better eyes.

6. In order to prepare the mind of the reader for the easier conceiving what follows, it is proper to premise somewhat, by way of Introduction, concerning the nature and abuse of Language. But the unravelling this matter leads me in some measure to anticipate my design, by taking notice of what seems to have had a chief part in rendering speculation intricate and perplexed, and to have occasioned innumerable errors and difficulties in almost all parts of knowledge. And that is the

opinion that the mind hath a power of framing abstract ideas or notions of things. He who is not a perfect stranger to the writings and disputes of philosophers must needs acknowledge that no small part of them are spent about abstract ideas. These are in a more especial manner thought to be the object of those sciences which go by the name of Logic and Metaphysics, and of all that which passes under the notion of the most abstracted and sublime learning, in all which one shall scarce find any question handled in such a manner as does not suppose their existence in the mind, and that it is well acquainted with them.

7. It is agreed on all hands that the qualities or modes of things do never really exist each of them apart by itself, and separated from all others, but are mixed, as it were, and blended together, several in the same object. But, we are told, the mind being able to consider each quality singly, or abstracted from those other qualities with which it is united, does by that means frame to itself abstract ideas. For example, there is perceived by sight an object extended, coloured, and moved: this mixed or compound idea the mind resolving into its simple, constituent parts, and viewing each by itself, exclusive of the rest, does frame the abstract ideas of extension, colour, and motion. Not that it is possible for colour or motion to exist without extension; but only that the mind can frame to itself by abstraction the idea of colour exclusive of extension, and of motion exclusive of both colour and extension.

8. Again, the mind having observed that in the particular extensions perceived by sense there is something common and alike in all, and some other things peculiar, as this or that figure or magnitude, which distinguish them one from another; it considers apart or singles out by itself that which is common, making thereof a most abstract idea of extension, which is neither line, surface, nor solid, nor has any figure or magnitude, but is an idea entirely prescinded from all these. So likewise the mind, by leaving out of the particular colours perceived by sense that which distinguishes them one from another, and retaining that only which is common to all, makes an idea of colour in abstract which is neither red, nor blue, nor white, nor any other determinate colour. And, in like manner, by considering motion abstractedly not only from the body moved, but likewise from the figure it describes, and all particular directions and velocities, the abstract idea of motion is framed; which equally corresponds to all particular motions whatsoever that may be perceived by sense.

9. And as the mind frames to itself abstract ideas of qualities or modes, so does it, by the same precision or mental separation, attain abstract ideas of the more compounded beings which include several coexistent qualities. For example, the mind having observed that Peter, James, and John resemble each other in certain common agreements of shape and other qualities, leaves out of the complex or compounded idea it has of Peter, James, and any other particular man, that which is peculiar to each, retaining only what is common to all, and so makes an abstract idea wherein all the particulars equally partake- abstracting entirely from and cutting off all those circumstances and differences which might determine it to any particular existence. And after this manner it is said we come by the abstract idea of man, or, if you please, humanity, or human nature; wherein it is true there is included colour, because there is no man but has some colour, but then it can be neither white, nor black, nor any particular colour, because there is no one particular colour wherein all men partake. So likewise there is included stature, but then it is neither tall stature, nor low stature, nor yet middle stature, but something abstracted from all these. And so of the rest. Moreover, their being a great variety of other creatures that partake in some parts, but not all, of the complex idea of man, the mind, leaving out those parts which are peculiar to men, and retaining those only which are common to all the living creatures, frames the idea of animal, which

abstracts not only from all particular men, but also all birds, beasts, fishes, and insects. The constituent parts of the abstract idea of animal are body, life, sense, and spontaneous motion. By body is meant body without any particular shape or figure, there being no one shape or figure common to all animals, without covering, either of hair, or feathers, or scales, &c., nor yet naked: hair, feathers, scales, and nakedness being the distinguishing properties of particular animals, and for that reason left out of the abstract idea. Upon the same account the spontaneous motion must be neither walking, nor flying, nor creeping; it is nevertheless a motion, but what that motion is it is not easy to conceive.

10. Whether others have this wonderful faculty of abstracting their ideas, they best can tell: for myself, I find indeed I have a faculty of imagining, or representing to myself, the ideas of those particular things I have perceived, and of variously compounding and dividing them. I can imagine a man with two heads, or the upper parts of a man joined to the body of a horse. I can consider the hand, the eye, the nose, each by itself abstracted or separated from the rest of the body. But then whatever hand or eye I imagine, it must have some particular shape and colour. Likewise the idea of man that I frame to myself must be either of a white, or a black, or a tawny, a straight, or a crooked, a tall, or a low, or a middle-sized man. I cannot by any effort of thought conceive the abstract idea above described. And it is equally impossible for me to form the abstract idea of motion distinct from the body moving, and which is neither swift nor slow, curvilinear nor rectilinear; and the like may be said of all other abstract general ideas whatsoever. To be plain, I own myself able to abstract in one sense, as when I consider some particular parts or qualities separated from others, with which, though they are united in some object, yet it is possible they may really exist without them. But I deny that I can abstract from one another, or conceive separately, those qualities which it is impossible should exist so separated; or that I can frame a general notion, by abstracting from particulars in the manner aforesaid- which last are the two proper acceptations of abstraction. And there are grounds to think most men will acknowledge themselves to be in my case. The generality of men which are simple and illiterate never pretend to abstract notions. It is said they are difficult and not to be attained without pains and study; we may therefore reasonably conclude that, if such there be, they are confined only to the learned.

11. I proceed to examine what can be alleged in defence of the doctrine of abstraction, and try if I can discover what it is that inclines the men of speculation to embrace an opinion so remote from common sense as that seems to be. There has been a late deservedly esteemed philosopher who, no doubt, has given it very much countenance, by seeming to think the having abstract general ideas is what puts the widest difference in point of understanding betwixt man and beast. "The having of general ideas," saith he, "is that which puts a perfect distinction betwixt man and brutes, and is an excellency which the faculties of brutes do by no means attain unto. For, it is evident we observe no foot-steps in them of making use of general signs for universal ideas; from which we have reason to imagine that they have not the faculty of abstracting, or making general ideas, since they have no use of words or any other general signs." And a little after: "Therefore, I think, we may suppose that it is in this that the species of brutes are discriminated from men, and it is that proper difference wherein they are wholly separated, and which at last widens to so wide a distance. For, if they have any ideas at all, and are not bare machines (as some would have them), we cannot deny them to have some reason. It seems as evident to me that they do, some of them, in certain instances reason as that they have sense; but it is only in particular ideas, just as they receive them from their senses. They are the best of them tied up within those narrow bounds, and have not (as I think) the faculty to enlarge them by any kind of abstraction."- Essay on Human Understanding,

II. xi. 10 and 11. I readily agree with this learned author, that the faculties of brutes can by no means attain to abstraction. But then if this be made the distinguishing property of that sort of animals, I fear a great many of those that pass for men must be reckoned into their number. The reason that is here assigned why we have no grounds to think brutes have abstract general ideas is, that we observe in them no use of words or any other general signs; which is built on this supposition- that the making use of words implies the having general ideas. From which it follows that men who use language are able to abstract or generalize their ideas. That this is the sense and arguing of the author will further appear by his answering the question he in another place puts: "Since all things that exist are only particulars, how come we by general terms?" His answer is: "Words become general by being made the signs of general ideas."- Essay on Human Understanding, IV. iii. 6. But it seems that a word becomes general by being made the sign, not of an abstract general idea, but of several particular ideas, any one of which it indifferently suggests to the mind. For example, when it is said "the change of motion is proportional to the impressed force," or that "whatever has extension is divisible," these propositions are to be understood of motion and extension in general; and nevertheless it will not follow that they suggest to my thoughts an idea of motion without a body moved, or any determinate direction and velocity, or that I must conceive an abstract general idea of extension, which is neither line, surface, nor solid, neither great nor small, black, white, nor red, nor of any other determinate colour. It is only implied that whatever particular motion I consider, whether it be swift or slow, perpendicular, horizontal, or oblique, or in whatever object, the axiom concerning it holds equally true. As does the other of every particular extension, it matters not whether line, surface, or solid, whether of this or that magnitude or figure.

12. By observing how ideas become general we may the better judge how words are made so. And here it is to be noted that I do not deny absolutely there are general ideas, but only that there are any abstract general ideas; for, in the passages we have quoted wherein there is mention of general ideas, it is always supposed that they are formed by abstraction, after the manner set forth in sections 8 and 9. Now, if we will annex a meaning to our words, and speak only of what we can conceive, I believe we shall acknowledge that an idea which, considered in itself, is particular, becomes general by being made to represent or stand for all other particular ideas of the same sort. To make this plain by an example, suppose a geometrician is demonstrating the method of cutting a line in two equal parts. He draws, for instance, a black line of an inch in length: this, which in itself is a particular line, is nevertheless with regard to its signification general, since, as it is there used, it represents all particular lines whatsoever; so that what is demonstrated of it is demonstrated of all lines, or, in other words, of a line in general. And, as that particular line becomes general by being made a sign, so the name "line," which taken absolutely is particular, by being a sign is made general. And as the former owes its generality not to its being the sign of an abstract or general line, but of all particular right lines that may possibly exist, so the latter must be thought to derive its generality from the same cause, namely, the various particular lines which it indifferently denotes.

13. To give the reader a yet clearer view of the nature of abstract ideas, and the uses they are thought necessary to, I shall add one more passage out of the Essay on Human Understanding, (IV. vii. 9) which is as follows: "Abstract ideas are not so obvious or easy to children or the yet unexercised mind as particular ones. If they seem so to grown men it is only because by constant and familiar use they are made so. For, when we nicely reflect upon them, we shall find that general ideas are fictions and contrivances of the mind, that carry difficulty with them, and do not

so easily offer themselves as we are apt to imagine. For example, does it not require some pains and skill to form the general idea of a triangle (which is yet none of the most abstract, comprehensive, and difficult); for it must be neither oblique nor rectangle, neither equilateral, equicrural, nor scalenon, but all and none of these at once? In effect, it is something imperfect that cannot exist, an idea wherein some parts of several different and inconsistent ideas are put together. It is true the mind in this imperfect state has need of such ideas, and makes all the haste to them it can, for the conveniency of communication and enlargement of knowledge, to both which it is naturally very much inclined. But yet one has reason to suspect such ideas are marks of our imperfection. At least this is enough to show that the most abstract and general ideas are not those that the mind is first and most easily acquainted with, nor such as its earliest knowledge is conversant about."- If any man has the faculty of framing in his mind such an idea of a triangle as is here described, it is in vain to pretend to dispute him out of it, nor would I go about it. All I desire is that the reader would fully and certainly inform himself whether he has such an idea or no. And this, methinks, can be no hard task for anyone to perform. What more easy than for anyone to look a little into his own thoughts, and there try whether he has, or can attain to have, an idea that shall correspond with the description that is here given of the general idea of a triangle, which is "neither oblique nor rectangle, equilateral, equicrural nor scalenon, but all and none of these at once?"

14. Much is here said of the difficulty that abstract ideas carry with them, and the pains and skill requisite to the forming them. And it is on all hands agreed that there is need of great toil and labour of the mind, to emancipate our thoughts from particular objects, and raise them to those sublime speculations that are conversant about abstract ideas. From all which the natural consequence should seem to be, that so difficult a thing as the forming abstract ideas was not necessary for communication, which is so easy and familiar to all sorts of men. But, we are told, if they seem obvious and easy to grown men, it is only because by constant and familiar use they are made so. Now, I would fain know at what time it is men are employed in surmounting that difficulty, and furnishing themselves with those necessary helps for discourse. It cannot be when they are grown up, for then it seems they are not conscious of any such painstaking; it remains therefore to be the business of their childhood. And surely the great and multiplied labour of framing abstract notions will be found a hard task for that tender age. Is it not a hard thing to imagine that a couple of children cannot prate together of their sugar-plums and rattles and the rest of their little trinkets, till they have first tacked together numberless inconsistencies, and so framed in their minds abstract general ideas, and annexed them to every common name they make use of?

15. Nor do I think them a whit more needful for the enlargement of knowledge than for communication. It is, I know, a point much insisted on, that all knowledge and demonstration are about universal notions, to which I fully agree: but then it doth not appear to me that those notions are formed by abstraction in the manner premised- universality, so far as I can comprehend, not consisting in the absolute, positive nature or conception of anything, but in the relation it bears to the particulars signified or represented by it; by virtue whereof it is that things, names, or notions, being in their own nature particular, are rendered universal. Thus, when I demonstrate any proposition concerning triangles, it is to be supposed that I have in view the universal idea of a triangle; which ought not to be understood as if I could frame an idea of a triangle which was neither equilateral, nor scalenon, nor equicrural; but only that the particular triangle I consider, whether of this or that sort it matters not, doth equally stand for and represent all rectilinear triangles whatsoever, and is in that sense universal. All which seems very plain and not to include

any difficulty in it.

16. But here it will be demanded, how we can know any proposition to be true of all particular triangles, except we have first seen it demonstrated of the abstract idea of a triangle which equally agrees to all? For, because a property may be demonstrated to agree to some one particular triangle, it will not thence follow that it equally belongs to any other triangle, which in all respects is not the same with it. For example, having demonstrated that the three angles of an isosceles rectangular triangle are equal to two right ones, I cannot therefore conclude this affection agrees to all other triangles which have neither a right angle nor two equal sides. It seems therefore that, to be certain this proposition is universally true, we must either make a particular demonstration for every particular triangle, which is impossible, or once for all demonstrate it of the abstract idea of a triangle, in which all the particulars do indifferently partake and by which they are all equally represented. To which I answer, that, though the idea I have in view whilst I make the demonstration be, for instance, that of an isosceles rectangular triangle whose sides are of a determinate length, I may nevertheless be certain it extends to all other rectilinear triangles, of what sort or bigness soever. And that because neither the right angle, nor the equality, nor determinate length of the sides are at all concerned in the demonstration. It is true the diagram I have in view includes all these particulars, but then there is not the least mention made of them in the proof of the proposition. It is not said the three angles are equal to two right ones, because one of them is a right angle, or because the sides comprehending it are of the same length. Which sufficiently shows that the right angle might have been oblique, and the sides unequal, and for all that the demonstration have held good. And for this reason it is that I conclude that to be true of any obliquangular or scalenon which I had demonstrated of a particular right-angled equicrural triangle, and not because I demonstrated the proposition of the abstract idea of a triangle And here it must be acknowledged that a man may consider a figure merely as triangular, without attending to the particular qualities of the angles, or relations of the sides. So far he may abstract; but this will never prove that he can frame an abstract, general, inconsistent idea of a triangle. In like manner we may consider Peter so far forth as man, or so far forth as animal without framing the fore-mentioned abstract idea, either of man or of animal, inasmuch as all that is perceived is not considered.

17. It were an endless as well as an useless thing to trace the Schoolmen, those great masters of abstraction, through all the manifold inextricable labyrinths of error and dispute which their doctrine of abstract natures and notions seems to have led them into. What bickerings and controversies, and what a learned dust have been raised about those matters, and what mighty advantage has been from thence derived to mankind, are things at this day too clearly known to need being insisted on. And it had been well if the ill effects of that doctrine were confined to those only who make the most avowed profession of it. When men consider the great pains, industry, and parts that have for so many ages been laid out on the cultivation and advancement of the sciences, and that notwithstanding all this the far greater part of them remains full of darkness and uncertainty, and disputes that are like never to have an end, and even those that are thought to be supported by the most clear and cogent demonstrations contain in them paradoxes which are perfectly irreconcilable to the understandings of men, and that, taking all together, a very small portion of them does supply any real benefit to mankind, otherwise than by being an innocent diversion and amusement- I say the consideration of all this is apt to throw them into a despondency and perfect contempt of all study. But this may perhaps cease upon a view of the false principles that have obtained in the world, amongst all which there is none, methinks, hath a more

wide and extended sway over the thoughts of speculative men than this of abstract general ideas.

18. I come now to consider the source of this prevailing notion, and that seems to me to be language. And surely nothing of less extent than reason itself could have been the source of an opinion so universally received. The truth of this appears as from other reasons so also from the plain confession of the ablest patrons of abstract ideas, who acknowledge that they are made in order to naming; from which it is a clear consequence that if there had been no such things as speech or universal signs there never had been any thought of abstraction. See III. vi. 39, and elsewhere of the Essay on Human Understanding. Let us examine the manner wherein words have contributed to the origin of that mistake.- First then, it is thought that every name has, or ought to have, one only precise and settled signification, which inclines men to think there are certain abstract, determinate ideas that constitute the true and only immediate signification of each general name; and that it is by the mediation of these abstract ideas that a general name comes to signify any particular thing. Whereas, in truth, there is no such thing as one precise and definite signification annexed to any general name, they all signifying indifferently a great number of particular ideas. All which doth evidently follow from what has been already said, and will clearly appear to anyone by a little reflexion. To this it will be objected that every name that has a definition is thereby restrained to one certain signification. For example, a triangle is defined to be "a plain surface comprehended by three right lines," by which that name is limited to denote one certain idea and no other. To which I answer, that in the definition it is not said whether the surface be great or small, black or white, nor whether the sides are long or short, equal or unequal, nor with what angles they are inclined to each other; in all which there may be great variety, and consequently there is no one settled idea which limits the signification of the word triangle. It is one thing for to keep a name constantly to the same definition, and another to make it stand everywhere for the same idea; the one is necessary, the other useless and impracticable.

19. But, to give a farther account how words came to produce the doctrine of abstract ideas, it must be observed that it is a received opinion that language has no other end but the communicating our ideas, and that every significant name stands for an idea. This being so, and it being withal certain that names which yet are not thought altogether insignificant do not always mark out particular conceivable ideas, it is straightway concluded that they stand for abstract notions. That there are many names in use amongst speculative men which do not always suggest to others determinate, particular ideas, or in truth anything at all, is what nobody will deny. And a little attention will discover that it is not necessary (even in the strictest reasonings) significant names which stand for ideas should, every time they are used, excite in the understanding the ideas they are made to stand for- in reading and discoursing, names being for the most part used as letters are in Algebra, in which, though a particular quantity be marked by each letter, yet to proceed right it is not requisite that in every step each letter suggest to your thoughts that particular quantity it was appointed to stand for.

20. Besides, the communicating of ideas marked by words is not the chief and only end of language, as is commonly supposed. There are other ends, as the raising of some passion, the exciting to or deterring from an action, the putting the mind in some particular disposition- to which the former is in many cases barely subservient, and sometimes entirely omitted, when these can be obtained without it, as I think does not unfrequently happen in the familiar use of language. I entreat the reader to reflect with himself, and see if it doth not often happen, either in hearing or reading a discourse, that the passions of fear, love, hatred, admiration, disdain, and the like, arise immediately in his mind upon the perception of certain words, without any ideas coming between.

At first, indeed, the words might have occasioned ideas that were fitting to produce those emotions; but, if I mistake not, it will be found that, when language is once grown familiar, the hearing of the sounds or sight of the characters is oft immediately attended with those passions which at first were wont to be produced by the intervention of ideas that are now quite omitted. May we not, for example, be affected with the promise of a good thing, though we have not an idea of what it is? Or is not the being threatened with danger sufficient to excite a dread, though we think not of any particular evil likely to befal us, nor yet frame to ourselves an idea of danger in abstract? If any one shall join ever so little reflexion of his own to what has been said, I believe that it will evidently appear to him that general names are often used in the propriety of language without the speaker's designing them for marks of ideas in his own, which he would have them raise in the mind of the hearer. Even proper names themselves do not seem always spoken with a design to bring into our view the ideas of those individuals that are supposed to be marked by them. For example, when a schoolman tells me "Aristotle hath said it," all I conceive he means by it is to dispose me to embrace his opinion with the deference and submission which custom has annexed to that name. And this effect is often so instantly produced in the minds of those who are accustomed to resign their judgment to authority of that philosopher, as it is impossible any idea either of his person, writings, or reputation should go before. Innumerable examples of this kind may be given, but why should I insist on those things which every one's experience will, I doubt not, plentifully suggest unto him?

21. We have, I think, shewn the impossibility of Abstract Ideas. We have considered what has been said for them by their ablest patrons; and endeavored to show they are of no use for those ends to which they are thought necessary. And lastly, we have traced them to the source from whence they flow, which appears evidently to be language.- It cannot be denied that words are of excellent use, in that by their means all that stock of knowledge which has been purchased by the joint labours of inquisitive men in all ages and nations may be drawn into the view and made the possession of one single person. But at the same time it must be owned that most parts of knowledge have been strangely perplexed and darkened by the abuse of words, and general ways of speech wherein they are delivered. Since therefore words are so apt to impose on the understanding, whatever ideas I consider, I shall endeavour to take them bare and naked into my view, keeping out of my thoughts so far as I am able, those names which long and constant use hath so strictly united with them; from which I may expect to derive the following advantages:

22. First, I shall be sure to get clear of all controversies purely verbal- the springing up of which weeds in almost all the sciences has been a main hindrance to the growth of true and sound knowledge. Secondly, this seems to be a sure way to extricate myself out of that fine and subtle net of abstract ideas which has so miserably perplexed and entangled the minds of men; and that with this peculiar circumstance, that by how much the finer and more curious was the wit of any man, by so much the deeper was he likely to be ensnared and faster held therein. Thirdly, so long as I confine my thoughts to my own ideas divested of words, I do not see how I can easily be mistaken. The objects I consider, I clearly and adequately know. I cannot be deceived in thinking I have an idea which I have not. It is not possible for me to imagine that any of my own ideas are alike or unlike that are not truly so. To discern the agreements or disagreements there are between my ideas, to see what ideas are included in any compound idea and what not, there is nothing more requisite than an attentive perception of what passes in my own understanding.

23. But the attainment of all these advantages doth presuppose an entire deliverance from the deception of words, which I dare hardly promise myself; so difficult a thing it is to dissolve an

union so early begun, and confirmed by so long a habit as that betwixt words and ideas. Which difficulty seems to have been very much increased by the doctrine of abstraction. For, so long as men thought abstract ideas were annexed to their words, it doth not seem strange that they should use words for ideas- it being found an impracticable thing to lay aside the word, and retain the abstract idea in the mind, which in itself was perfectly inconceivable. This seems to me the principal cause why those men who have so emphatically recommended to others the laying aside all use of words in their meditations, and contemplating their bare ideas, have yet failed to perform it themselves. Of late many have been very sensible of the absurd opinions and insignificant disputes which grow out of the abuse of words. And, in order to remedy these evils, they advise well, that we attend to the ideas signified, and draw off our attention from the words which signify them. But, how good soever this advice may be they have given others, it is plain they could not have a due regard to it themselves, so long as they thought the only immediate use of words was to signify ideas, and that the immediate signification of every general name was a determinate abstract idea.

24. But, these being known to be mistakes, a man may with greater ease prevent his being imposed on by words. He that knows he has no other than particular ideas, will not puzzle himself in vain to find out and conceive the abstract idea annexed to any name. And he that knows names do not always stand for ideas will spare himself the labour of looking for ideas where there are none to be had. It were, therefore, to be wished that everyone would use his utmost endeavours to obtain a clear view of the ideas he would consider, separating from them all that dress and incumbrance of words which so much contribute to blind the judgment and divide the attention. In vain do we extend our view into the heavens and pry into the entrails of the earth, in vain do we consult the writings of learned men and trace the dark footsteps of antiquity- we need only draw the curtain of words, to hold the fairest tree of knowledge, whose fruit is excellent, and within the reach of our hand.

25. Unless we take care to clear the First Principles of Knowledge from the embarras and delusion of words, we may make infinite reasonings upon them to no purpose; we may draw consequences from consequences, and be never the wiser. The farther we go, we shall only lose ourselves the more irrecoverably, and be the deeper entangled in difficulties and mistakes. Whoever therefore designs to read the following sheets, I entreat him to make my words the occasion of his own thinking, and endeavour to attain the same train of thoughts in reading that I had in writing them. By this means it will be easy for him to discover the truth or falsity of what I say. He will be out of all danger of being deceived by my words, and I do not see how he can be led into an error by considering his own naked, undisguised ideas.

A Treatise Concerning the Principles of Human Knowledge

1. It is evident to any one who takes a survey of the objects of human knowledge, that they are either ideas actually imprinted on the senses; or else such as are perceived by attending to the passions and operations of the mind; or lastly, ideas formed by help of memory and imagination- either compounding, dividing, or barely representing those originally perceived in the aforesaid

ways. By sight I have the ideas of light and colours, with their several degrees and variations. By touch I perceive hard and soft, heat and cold, motion and resistance, and of all these more and less either as to quantity or degree. Smelling furnishes me with odours; the palate with tastes; and hearing conveys sounds to the mind in all their variety of tone and composition. And as several of these are observed to accompany each other, they come to be marked by one name, and so to be reputed as one thing. Thus, for example a certain colour, taste, smell, figure and consistence having been observed to go together, are accounted one distinct thing, signified by the name apple; other collections of ideas constitute a stone, a tree, a book, and the like sensible things- which as they are pleasing or disagreeable excite the passions of love, hatred, joy, grief, and so forth.

2. But, besides all that endless variety of ideas or objects of knowledge, there is likewise something which knows or perceives them, and exercises divers operations, as willing, imagining, remembering, about them. This perceiving, active being is what I call mind, spirit, soul, or myself. By which words I do not denote any one of my ideas, but a thing entirely distinct from them, wherein, they exist, or, which is the same thing, whereby they are perceived- for the existence of an idea consists in being perceived.

3. That neither our thoughts, nor passions, nor ideas formed by the imagination, exist without the mind, is what everybody will allow. And it seems no less evident that the various sensations or ideas imprinted on the sense, however blended or combined together (that is, whatever objects they compose), cannot exist otherwise than in a mind perceiving them.- I think an intuitive knowledge may be obtained of this by any one that shall attend to what is meant by the term exists, when applied to sensible things. The table I write on I say exists, that is, I see and feel it; and if I were out of my study I should say it existed- meaning thereby that if I was in my study I might perceive it, or that some other spirit actually does perceive it. There was an odour, that is, it was smelt; there was a sound, that is, it was heard; a colour or figure, and it was perceived by sight or touch. This is all that I can understand by these and the like expressions. For as to what is said of the absolute existence of unthinking things without any relation to their being perceived, that seems perfectly unintelligible. Their esse is percepi, nor is it possible they should have any existence out of the minds or thinking things which perceive them.

4. It is indeed an opinion strangely prevailing amongst men, that houses, mountains, rivers, and in a word all sensible objects, have an existence, natural or real, distinct from their being perceived by the understanding. But, with how great an assurance and acquiescence soever this principle may be entertained in the world, yet whoever shall find in his heart to call it in question may, if I mistake not, perceive it to involve a manifest contradiction. For, what are the fore-mentioned objects but the things we perceive by sense? and what do we perceive besides our own ideas or sensations? and is it not plainly repugnant that any one of these, or any combination of them, should exist unperceived?

5. If we thoroughly examine this tenet it will, perhaps, be found at bottom to depend on the doctrine of abstract ideas. For can there be a nicer strain of abstraction than to distinguish the existence of sensible objects from their being perceived, so as to conceive them existing unperceived? Light and colours, heat and cold, extension and figures- in a word the things we see and feel- what are they but so many sensations, notions, ideas, or impressions on the sense? and is it possible to separate, even in thought, any of these from perception? For my part, I might as easily divide a thing from itself. I may, indeed, divide in my thoughts, or conceive apart from each other, those things which, perhaps I never perceived by sense so divided. Thus, I imagine the trunk of a human body without the limbs, or conceive the smell of a rose without thinking on the rose

itself. So far, I will not deny, I can abstract- if that may properly be called abstraction which extends only to the conceiving separately such objects as it is possible may really exist or be actually perceived asunder. But my conceiving or imagining power does not extend beyond the possibility of real existence or perception. Hence, as it is impossible for me to see or feel anything without an actual sensation of that thing, so is it impossible for me to conceive in my thoughts any sensible thing or object distinct from the sensation or perception of it.

6. Some truths there are so near and obvious to the mind that a man need only open his eyes to see them. Such I take this important one to be, viz., that all the choir of heaven and furniture of the earth, in a word all those bodies which compose the mighty frame of the world, have not any subsistence without a mind, that their being is to be perceived or known; that consequently so long as they are not actually perceived by me, or do not exist in my mind or that of any other created spirit, they must either have no existence at all, or else subsist in the mind of some Eternal Spirit- it being perfectly unintelligible, and involving all the absurdity of abstraction, to attribute to any single part of them an existence independent of a spirit. To be convinced of which, the reader need only reflect, and try to separate in his own thoughts the being of a sensible thing from its being perceived.

7. From what has been said it follows there is not any other Substance than Spirit, or that which perceives. But, for the fuller proof of this point, let it be considered the sensible qualities are colour, figure, motion, smell, taste, etc., i.e. the ideas perceived by sense. Now, for an idea to exist in an unperceiving thing is a manifest contradiction, for to have an idea is all one as to perceive; that therefore wherein colour, figure, and the like qualities exist must perceive them; hence it is clear there can be no unthinking substance or substratum of those ideas.

8. But, say you, though the ideas themselves do not exist without the mind, yet there may be things like them, whereof they are copies or resemblances, which things exist without the mind in an unthinking substance. I answer, an idea can be like nothing but an idea; a colour or figure can be like nothing but another colour or figure. If we look but never so little into our thoughts, we shall find it impossible for us to conceive a likeness except only between our ideas. Again, I ask whether those supposed originals or external things, of which our ideas are the pictures or representations, be themselves perceivable or no? If they are, then they are ideas and we have gained our point; but if you say they are not, I appeal to any one whether it be sense to assert a colour is like something which is invisible; hard or soft, like something which is intangible; and so of the rest.

9. Some there are who make a distinction betwixt primary and secondary qualities. By the former they mean extension, figure, motion, rest, solidity or impenetrability, and number; by the latter they denote all other sensible qualities, as colours, sounds, tastes, and so forth. The ideas we have of these they acknowledge not to be the resemblances of anything existing without the mind, or unperceived, but they will have our ideas of the primary qualities to be patterns or images of things which exist without the mind, in an unthinking substance which they call Matter. By Matter, therefore, we are to understand an inert, senseless substance, in which extension, figure, and motion do actually subsist. But it is evident from what we have already shown, that extension, figure, and motion are only ideas existing in the mind, and that an idea can be like nothing but another idea, and that consequently neither they nor their archetypes can exist in an unperceiving substance. Hence, it is plain that that the very notion of what is called Matter or corporeal substance, involves a contradiction in it.

10. They who assert that figure, motion, and the rest of the primary or original qualities do exist

without the mind in unthinking substances, do at the same time acknowledge that colours, sounds, heat cold, and suchlike secondary qualities, do not- which they tell us are sensations existing in the mind alone, that depend on and are occasioned by the different size, texture, and motion of the minute particles of matter. This they take for an undoubted truth, which they can demonstrate beyond all exception. Now, if it be certain that those original qualities are inseparably united with the other sensible qualities, and not, even in thought, capable of being abstracted from them, it plainly follows that they exist only in the mind. But I desire any one to reflect and try whether he can, by any abstraction of thought, conceive the extension and motion of a body without all other sensible qualities. For my own part, I see evidently that it is not in my power to frame an idea of a body extended and moving, but I must withal give it some colour or other sensible quality which is acknowledged to exist only in the mind. In short, extension, figure, and motion, abstracted from all other qualities, are inconceivable. Where therefore the other sensible qualities are, there must these be also, to wit, in the mind and nowhere else.

11. Again, great and small, swift and slow, are allowed to exist nowhere without the mind, being entirely relative, and changing as the frame or position of the organs of sense varies. The extension therefore which exists without the mind is neither great nor small, the motion neither swift nor slow, that is, they are nothing at all. But, say you, they are extension in general, and motion in general: thus we see how much the tenet of extended movable substances existing without the mind depends on the strange doctrine of abstract ideas. And here I cannot but remark how nearly the vague and indeterminate description of Matter or corporeal substance, which the modern philosophers are run into by their own principles, resembles that antiquated and so much ridiculed notion of materia prima, to be met with in Aristotle and his followers. Without extension solidity cannot be conceived; since therefore it has been shewn that extension exists not in an unthinking substance, the same must also be true of solidity.

12. That number is entirely the creature of the mind, even though the other qualities be allowed to exist without, will be evident to whoever considers that the same thing bears a different denomination of number as the mind views it with different respects. Thus, the same extension is one, or three, or thirty-six, according as the mind considers it with reference to a yard, a foot, or an inch. Number is so visibly relative, and dependent on men's understanding, that it is strange to think how any one should give it an absolute existence without the mind. We say one book, one page, one line, etc.; all these are equally units, though some contain several of the others. And in each instance, it is plain, the unit relates to some particular combination of ideas arbitrarily put together by the mind.

13. Unity I know some will have to be a simple or uncompounded idea, accompanying all other ideas into the mind. That I have any such idea answering the word unity I do not find; and if I had, methinks I could not miss finding it: on the contrary, it should be the most familiar to my understanding, since it is said to accompany all other ideas, and to be perceived by all the ways of sensation and reflexion. To say no more, it is an abstract idea.

14. I shall farther add, that, after the same manner as modern philosophers prove certain sensible qualities to have no existence in Matter, or without the mind, the same thing may be likewise proved of all other sensible qualities whatsoever. Thus, for instance, it is said that heat and cold are affections only of the mind, and not at all patterns of real beings, existing in the corporeal substances which excite them, for that the same body which appears cold to one hand seems warm to another. Now, why may we not as well argue that figure and extension are not patterns or resemblances of qualities existing in Matter, because to the same eye at different stations, or eyes of

a different texture at the same station, they appear various, and cannot therefore be the images of anything settled and determinate without the mind? Again, it is proved that sweetness is not really in the sapid thing, because the thing remaining unaltered the sweetness is changed into bitter, as in case of a fever or otherwise vitiated palate. Is it not as reasonable to say that motion is not without the mind, since if the succession of ideas in the mind become swifter, the motion, it is acknowledged, shall appear slower without any alteration in any external object?

15. In short, let any one consider those arguments which are thought manifestly to prove that colours and taste exist only in the mind, and he shall find they may with equal force be brought to prove the same thing of extension, figure, and motion. Though it must be confessed this method of arguing does not so much prove that there is no extension or colour in an outward object, as that we do not know by sense which is the true extension or colour of the object. But the arguments foregoing plainly shew it to be impossible that any colour or extension at all, or other sensible quality whatsoever, should exist in an unthinking subject without the mind, or in truth, that there should be any such thing as an outward object.

16. But let us examine a little the received opinion.- It is said extension is a mode or accident of Matter, and that Matter is the substratum that supports it. Now I desire that you would explain to me what is meant by Matter's supporting extension. Say you, I have no idea of Matter and therefore cannot explain it. I answer, though you have no positive, yet, if you have any meaning at all, you must at least have a relative idea of Matter; though you know not what it is, yet you must be supposed to know what relation it bears to accidents, and what is meant by its supporting them. It is evident "support" cannot here be taken in its usual or literal sense- as when we say that pillars support a building; in what sense therefore must it be taken?

17. If we inquire into what the most accurate philosophers declare themselves to mean by material substance, we shall find them acknowledge they have no other meaning annexed to those sounds but the idea of Being in general, together with the relative notion of its supporting accidents. The general idea of Being appeareth to me the most abstract and incomprehensible of all other; and as for its supporting accidents, this, as we have just now observed, cannot be understood in the common sense of those words; it must therefore be taken in some other sense, but what that is they do not explain. So that when I consider the two parts or branches which make the signification of the words material substance, I am convinced there is no distinct meaning annexed to them. But why should we trouble ourselves any farther, in discussing this material substratum or support of figure and motion, and other sensible qualities? Does it not suppose they have an existence without the mind? And is not this a direct repugnancy, and altogether inconceivable?

18. But, though it were possible that solid, figured, movable substances may exist without the mind, corresponding to the ideas we have of bodies, yet how is it possible for us to know this? Either we must know it by sense or by reason. As for our senses, by them we have the knowledge only of our sensations, ideas, or those things that are immediately perceived by sense, call them what you will: but they do not inform us that things exist without the mind, or unperceived, like to those which are perceived. This the materialists themselves acknowledge. It remains therefore that if we have any knowledge at all of external things, it must be by reason, inferring their existence from what is immediately perceived by sense. But what reason can induce us to believe the existence of bodies without the mind, from what we perceive, since the very patrons of Matter themselves do not pretend there is any necessary connexion betwixt them and our ideas? I say it is granted on all hands (and what happens in dreams, phrensies, and the like, puts it beyond dispute) that it is possible we might be affected with all the ideas we have now, though there were no bodies existing

without resembling them. Hence, it is evident the supposition of external bodies is not necessary for the producing our ideas; since it is granted they are produced sometimes, and might possibly be produced always in the same order, we see them in at present, without their concurrence.

19. But, though we might possibly have all our sensations without them, yet perhaps it may be thought easier to conceive and explain the manner of their production, by supposing external bodies in their likeness rather than otherwise; and so it might be at least probable there are such things as bodies that excite their ideas in our minds. But neither can this be said; for, though we give the materialists their external bodies, they by their own confession are never the nearer knowing how our ideas are produced; since they own themselves unable to comprehend in what manner body can act upon spirit, or how it is possible it should imprint any idea in the mind. Hence it is evident the production of ideas or sensations in our minds can be no reason why we should suppose Matter or corporeal substances, since that is acknowledged to remain equally inexplicable with or without this supposition. If therefore it were possible for bodies to exist without the mind, yet to hold they do so, must needs be a very precarious opinion; since it is to suppose, without any reason at all, that God has created innumerable beings that are entirely useless, and serve to no manner of purpose.

20. In short, if there were external bodies, it is impossible we should ever come to know it; and if there were not, we might have the very same reasons to think there were that we have now. Suppose- what no one can deny possible- an intelligence without the help of external bodies, to be affected with the same train of sensations or ideas that you are, imprinted in the same order and with like vividness in his mind. I ask whether that intelligence hath not all the reason to believe the existence of corporeal substances, represented by his ideas, and exciting them in his mind, that you can possibly have for believing the same thing? Of this there can be no question- which one consideration were enough to make any reasonable person suspect the strength of whatever arguments be may think himself to have, for the existence of bodies without the mind.

21. Were it necessary to add any farther proof against the existence of Matter after what has been said, I could instance several of those errors and difficulties (not to mention impieties) which have sprung from that tenet. It has occasioned numberless controversies and disputes in philosophy, and not a few of far greater moment in religion. But I shall not enter into the detail of them in this place, as well because I think arguments a posteriori are unnecessary for confirming what has been, if I mistake not, sufficiently demonstrated a priori, as because I shall hereafter find occasion to speak somewhat of them.

22. I am afraid I have given cause to think I am needlessly prolix in handling this subject. For, to what purpose is it to dilate on that which may be demonstrated with the utmost evidence in a line or two, to any one that is capable of the least reflexion? It is but looking into your own thoughts, and so trying whether you can conceive it possible for a sound, or figure, or motion, or colour to exist without the mind or unperceived. This easy trial may perhaps make you see that what you contend for is a downright contradiction. Insomuch that I am content to put the whole upon this issue:- If you can but conceive it possible for one extended movable substance, or, in general, for any one idea, or anything like an idea, to exist otherwise than in a mind perceiving it, I shall readily give up the cause. And, as for all that compages of external bodies you contend for, I shall grant you its existence, though you cannot either give me any reason why you believe it exists, or assign any use to it when it is supposed to exist. I say, the bare possibility of your opinions being true shall pass for an argument that it is so.

23. But, say you, surely there is nothing easier than for me to imagine trees, for instance, in a park, or books existing in a closet, and nobody by to perceive them. I answer, you may so, there is no difficulty in it; but what is all this, I beseech you, more than framing in your mind certain ideas which you call books and trees, and the same time omitting to frame the idea of any one that may perceive them? But do not you yourself perceive or think of them all the while? This therefore is nothing to the purpose; it only shews you have the power of imagining or forming ideas in your mind: but it does not shew that you can conceive it possible the objects of your thought may exist without the mind. To make out this, it is necessary that you conceive them existing unconceived or unthought of, which is a manifest repugnancy. When we do our utmost to conceive the existence of external bodies, we are all the while only contemplating our own ideas. But the mind taking no notice of itself, is deluded to think it can and does conceive bodies existing unthought of or without the mind, though at the same time they are apprehended by or exist in itself. A little attention will discover to any one the truth and evidence of what is here said, and make it unnecessary to insist on any other proofs against the existence of material substance.

24. It is very obvious, upon the least inquiry into our thoughts, to know whether it is possible for us to understand what is meant by the absolute existence of sensible objects in themselves, or without the mind. To me it is evident those words mark out either a direct contradiction, or else nothing at all. And to convince others of this, I know no readier or fairer way than to entreat they would calmly attend to their own thoughts; and if by this attention the emptiness or repugnancy of those expressions does appear, surely nothing more is requisite for the conviction. It is on this therefore that I insist, to wit, that the absolute existence of unthinking things are words without a meaning, or which include a contradiction. This is what I repeat and inculcate, and earnestly recommend to the attentive thoughts of the reader.

25. All our ideas, sensations, notions, or the things which we perceive, by whatsoever names they may be distinguished, are visibly inactive- there is nothing of power or agency included in them. So that one idea or object of thought cannot produce or make any alteration in another. To be satisfied of the truth of this, there is nothing else requisite but a bare observation of our ideas. For, since they and every part of them exist only in the mind, it follows that there is nothing in them but what is perceived: but whoever shall attend to his ideas, whether of sense or reflexion, will not perceive in them any power or activity; there is, therefore, no such thing contained in them. A little attention will discover to us that the very being of an idea implies passiveness and inertness in it, insomuch that it is impossible for an idea to do anything, or, strictly speaking, to be the cause of anything: neither can it be the resemblance or pattern of any active being, as is evident from sect. 8. Whence it plainly follows that extension, figure, and motion cannot be the cause of our sensations. To say, therefore, that these are the effects of powers resulting from the configuration, number, motion, and size of corpuscles, must certainly be false.

26. We perceive a continual succession of ideas, some are anew excited, others are changed or totally disappear. There is therefore some cause of these ideas, whereon they depend, and which produces and changes them. That this cause cannot be any quality or idea or combination of ideas, is clear from the preceding section. I must therefore be a substance; but it has been shewn that there is no corporeal or material substance: it remains therefore that the cause of ideas is an incorporeal active substance or Spirit.

27. A spirit is one simple, undivided, active being- as it perceives ideas it is called the understanding, and as it produces or otherwise operates about them it is called the will. Hence there can be no idea formed of a soul or spirit; for all ideas whatever, being passive and inert (vide

sect. 25), they cannot represent unto us, by way of image or likeness, that which acts. A little attention will make it plain to any one, that to have an idea which shall be like that active principle of motion and change of ideas is absolutely impossible. Such is the nature of spirit, or that which acts, that it cannot be of itself perceived, but only by the effects which it produceth. If any man shall doubt of the truth of what is here delivered, let him but reflect and try if he can frame the idea of any power or active being, and whether he has ideas of two principal powers, marked by the names will and understanding, distinct from each other as well as from a third idea of Substance or Being in general, with a relative notion of its supporting or being the subject of the aforesaid powers- which is signified by the name soul or spirit. This is what some hold; but, so far as I can see, the words will, soul, spirit, do not stand for different ideas, or, in truth, for any idea at all, but for something which is very different from ideas, and which, being an agent, cannot be like unto, or represented by, any idea whatsoever. Though it must be owned at the same time that we have some notion of soul, spirit, and the operations of the mind: such as willing, loving, hating- inasmuch as we know or understand the meaning of these words.

28. I find I can excite ideas in my mind at pleasure, and vary and shift the scene as oft as I think fit. It is no more than willing, and straightway this or that idea arises in my fancy; and by the same power it is obliterated and makes way for another. This making and unmaking of ideas doth very properly denominate the mind active. Thus much is certain and grounded on experience; but when we think of unthinking agents or of exciting ideas exclusive of volition, we only amuse ourselves with words.

29. But, whatever power I may have over my own thoughts, I find the ideas actually perceived by Sense have not a like dependence on my will. When in broad daylight I open my eyes, it is not in my power to choose whether I shall see or no, or to determine what particular objects shall present themselves to my view; and so likewise as to the hearing and other senses; the ideas imprinted on them are not creatures of my will. There is therefore some other Will or Spirit that produces them.

30. The ideas of Sense are more strong, lively, and distinct than those of the imagination; they have likewise a steadiness, order, and coherence, and are not excited at random, as those which are the effects of human wills often are, but in a regular train or series, the admirable connexion whereof sufficiently testifies the wisdom and benevolence of its Author. Now the set rules or established methods wherein the Mind we depend on excites in us the ideas of sense, are called the laws of nature; and these we learn by experience, which teaches us that such and such ideas are attended with such and such other ideas, in the ordinary course of things.

31. This gives us a sort of foresight which enables us to regulate our actions for the benefit of life. And without this we should be eternally at a loss; we could not know how to act anything that might procure us the least pleasure, or remove the least pain of sense. That food nourishes, sleep refreshes, and fire warms us; that to sow in the seed-time is the way to reap in the harvest; and in general that to obtain such or such ends, such or such means are conducive- all this we know, not by discovering any necessary connexion between our ideas, but only by the observation of the settled laws of nature, without which we should be all in uncertainty and confusion, and a grown man no more know how to manage himself in the affairs of life than an infant just born.

32. And yet this consistent uniform working, which so evidently displays the goodness and wisdom of that Governing Spirit whose Will constitutes the laws of nature, is so far from leading our thoughts to Him, that it rather sends them wandering after second causes. For, when we perceive certain ideas of Sense constantly followed by other ideas and we know this is not of our own doing,

we forthwith attribute power and agency to the ideas themselves, and make one the cause of another, than which nothing can be more absurd and unintelligible. Thus, for example, having observed that when we perceive by sight a certain round luminous figure we at the same time perceive by touch the idea or sensation called heat, we do from thence conclude the sun to be the cause of heat. And in like manner perceiving the motion and collision of bodies to be attended with sound, we are inclined to think the latter the effect of the former.

33. The ideas imprinted on the Senses by the Author of nature are called real things; and those excited in the imagination being less regular, vivid, and constant, are more properly termed ideas, or images of things, which they copy and represent. But then our sensations, be they never so vivid and distinct, are nevertheless ideas, that is, they exist in the mind, or are perceived by it, as truly as the ideas of its own framing. The ideas of Sense are allowed to have more reality in them, that is, to be more strong, orderly, and coherent than the creatures of the mind; but this is no argument that they exist without the mind. They are also less dependent on the spirit, or thinking substance which perceives them, in that they are excited by the will of another and more powerful spirit; yet still they are ideas, and certainly no idea, whether faint or strong, can exist otherwise than in a mind perceiving it.

34. Before we proceed any farther it is necessary we spend some time in answering objections which may probably be made against the principles we have hitherto laid down. In doing of which, if I seem too prolix to those of quick apprehensions, I hope it may be pardoned, since all men do not equally apprehend things of this nature, and I am willing to be understood by every one.

First, then, it will be objected that by the foregoing principles all that is real and substantial in nature is banished out of the world, and instead thereof a chimerical scheme of ideas takes place. All things that exist, exist only in the mind, that is, they are purely notional. What therefore becomes of the sun, moon and stars? What must we think of houses, rivers, mountains, trees, stones; nay, even of our own bodies? Are all these but so many chimeras and illusions on the fancy? To all which, and whatever else of the same sort may be objected, I answer, that by the principles premised we are not deprived of any one thing in nature. Whatever we see, feel, hear, or anywise conceive or understand remains as secure as ever, and is as real as ever. There is a rerum natura, and the distinction between realities and chimeras retains its full force. This is evident from sect. 29, 30, and 33, where we have shewn what is meant by real things in opposition to chimeras or ideas of our own framing; but then they both equally exist in the mind, and in that sense they are alike ideas.

35. I do not argue against the existence of any one thing that we can apprehend either by sense or reflexion. That the things I see with my eyes and touch with my hands do exist, really exist, I make not the least question. The only thing whose existence we deny is that which philosophers call Matter or corporeal substance. And in doing of this there is no damage done to the rest of mankind, who, I dare say, will never miss it. The Atheist indeed will want the colour of an empty name to support his impiety; and the Philosophers may possibly find they have lost a great handle for trifling and disputation.

36. If any man thinks this detracts from the existence or reality of things, he is very far from understanding what hath been premised in the plainest terms I could think of. Take here an abstract of what has been said:- There are spiritual substances, minds, or human souls, which will or excite ideas in themselves at pleasure; but these are faint, weak, and unsteady in respect of others they perceive by sense- which, being impressed upon them according to certain rules or laws

of nature, speak themselves the effects of a mind more powerful and wise than human spirits. These latter are said to have more reality in them than the former:- by which is meant that they are more affecting, orderly, and distinct, and that they are not fictions of the mind perceiving them. And in this sense the sun that I see by day is the real sun, and that which I imagine by night is the idea of the former. In the sense here given of reality it is evident that every vegetable, star, mineral, and in general each part of the mundane system, is as much a real being by our principles as by any other. Whether others mean anything by the term reality different from what I do, I entreat them to look into their own thoughts and see.

37. I will be urged that thus much at least is true, to wit, that we take away all corporeal substances. To this my answer is, that if the word substance be taken in the vulgar sense- for a combination of sensible qualities, such as extension, solidity, weight, and the like- this we cannot be accused of taking away: but if it be taken in a philosophic sense- for the support of accidents or qualities without the mind- then indeed I acknowledge that we take it away, if one may be said to take away that which never had any existence, not even in the imagination.

38. But after all, say you, it sounds very harsh to say we eat and drink ideas, and are clothed with ideas. I acknowledge it does so- the word idea not being used in common discourse to signify the several combinations of sensible qualities which are called things; and it is certain that any expression which varies from the familiar use of language will seem harsh and ridiculous. But this doth not concern the truth of the proposition, which in other words is no more than to say, we are fed and clothed with those things which we perceive immediately by our senses. The hardness or softness, the colour, taste, warmth, figure, or suchlike qualities, which combined together constitute the several sorts of victuals and apparel, have been shewn to exist only in the mind that perceives them; and this is all that is meant by calling them ideas; which word if it was as ordinarily used as thing, would sound no harsher nor more ridiculous than it. I am not for disputing about the propriety, but the truth of the expression. If therefore you agree with me that we eat and drink and are clad with the immediate objects of sense, which cannot exist unperceived or without the mind, I shall readily grant it is more proper or conformable to custom that they should be called things rather than ideas.

39. If it be demanded why I make use of the word idea, and do not rather in compliance with custom call them things; I answer, I do it for two reasons:- first, because the term thing in contra-distinction to idea, is generally supposed to denote somewhat existing without the mind; secondly, because thing hath a more comprehensive signification than idea, including spirit or thinking things as well as ideas. Since therefore the objects of sense exist only in the mind, and are withal thoughtless and inactive, I chose to mark them by the word idea, which implies those properties.

40. But, say what we can, some one perhaps may be apt to reply, he will still believe his senses, and never suffer any arguments, how plausible soever, to prevail over the certainty of them. Be it so; assert the evidence of sense as high as you please, we are willing to do the same. That what I see, hear, and feel doth exist, that is to say, is perceived by me, I no more doubt than I do of my own being. But I do not see how the testimony of sense can be alleged as a proof for the existence of anything which is not perceived by sense. We are not for having any man turn sceptic and disbelieve his senses; on the contrary, we give them all the stress and assurance imaginable; nor are there any principles more opposite to Scepticism than those we have laid down, as shall be hereafter clearly shewn.

41. Secondly, it will be objected that there is a great difference betwixt real fire for instance, and the idea of fire, betwixt dreaming or imagining oneself burnt, and actually being so: if you suspect it to be only the idea of fire which you see, do but put your hand into it and you will be convinced with a witness. This and the like may be urged in opposition to our tenets. To all which the answer is evident from what hath been already said; and I shall only add in this place, that if real fire be very different from the idea of fire, so also is the real pain that it occasions very different from the idea of the same pain, and yet nobody will pretend that real pain either is, or can possibly be, in an unperceiving thing, or without the mind, any more than its idea.

42. Thirdly, it will be objected that we see things actually without or at distance from us, and which consequently do not exist in the mind; it being absurd that those things which are seen at the distance of several miles should be as near to us as our own thoughts. In answer to this, I desire it may be considered that in a dream we do oft perceive things as existing at a great distance off, and yet for all that, those things are acknowledged to have their existence only in the mind.

43. But, for the fuller clearing of this point, it may be worth while to consider how it is that we perceive distance and things placed at a distance by sight. For, that we should in truth see external space, and bodies actually existing in it, some nearer, others farther off, seems to carry with it some opposition to what hath been said of their existing nowhere without the mind. The consideration of this difficulty it was that gave birth to my "Essay towards a New Theory of Vision," which was published not long since, wherein it is shewn that distance or outness is neither immediately of itself perceived by sight, nor yet apprehended or judged of by lines and angles, or anything that hath a necessary connexion with it; but that it is only suggested to our thoughts by certain visible ideas and sensations attending vision, which in their own nature have no manner of similitude or relation either with distance or things placed at a distance; but, by a connexion taught us by experience, they come to signify and suggest them to us, after the same manner that words of any language suggest the ideas they are made to stand for; insomuch that a man born blind and afterwards made to see, would not, at first sight, think the things he saw to be without his mind, or at any distance from him. See sect. 41 of the fore-mentioned treatise.

44. The ideas of sight and touch make two species entirely distinct and heterogeneous. The former are marks and prognostics of the latter. That the proper objects of sight neither exist without mind, nor are the images of external things, was shewn even in that treatise. Though throughout the same the contrary be supposed true of tangible objects- not that to suppose that vulgar error was necessary for establishing the notion therein laid down, but because it was beside my purpose to examine and refute it in a discourse concerning Vision. So that in strict truth the ideas of sight, when we apprehend by them distance and things placed at a distance, do not suggest or mark out to us things actually existing at a distance, but only admonish us what ideas of touch will be imprinted in our minds at such and such distances of time, and in consequence of such or such actions. It is, I say, evident from what has been said in the foregoing parts of this Treatise, and in sect. 147 and elsewhere of the Essay concerning Vision, that visible ideas are the Language whereby the Governing Spirit on whom we depend informs us what tangible ideas he is about to imprint upon us, in case we excite this or that motion in our own bodies. But for a fuller information in this point I refer to the Essay itself.

45. Fourthly, it will be objected that from the foregoing principles it follows things are every moment annihilated and created anew. The objects of sense exist only when they are perceived; the trees therefore are in the garden, or the chairs in the parlour, no longer than while there is somebody by to perceive them. Upon shutting my eyes all the furniture in the room is reduced to

nothing, and barely upon opening them it is again created. In answer to all which, I refer the reader to what has been said in sect. 3, 4, &c., and desire he will consider whether he means anything by the actual existence of an idea distinct from its being perceived. For my part, after the nicest inquiry I could make, I am not able to discover that anything else is meant by those words; and I once more entreat the reader to sound his own thoughts, and not suffer himself to be imposed on by words. If he can conceive it possible either for his ideas or their archetypes to exist without being perceived, then I give up the cause; but if he cannot, he will acknowledge it is unreasonable for him to stand up in defence of he knows not what, and pretend to charge on me as an absurdity the not assenting to those propositions which at bottom have no meaning in them.

46. It will not be amiss to observe how far the received principles of philosophy are themselves chargeable with those pretended absurdities. It is thought strangely absurd that upon closing my eyelids all the visible objects around me should be reduced to nothing; and yet is not this what philosophers commonly acknowledge, when they agree on all hands that light and colours, which alone are the proper and immediate objects of sight, are mere sensations that exist no longer than they are perceived? Again, it may to some perhaps seem very incredible that things should be every moment creating, yet this very notion is commonly taught in the schools. For the Schoolmen, though they acknowledge the existence of Matter, and that the whole mundane fabric is framed out of it, are nevertheless of opinion that it cannot subsist without the divine conservation, which by them is expounded to be a continual creation.

47. Farther, a little thought will discover to us that though we allow the existence of Matter or corporeal substance, yet it will unavoidably follow, from the principles which are now generally admitted, that the particular bodies, of what kind soever, do none of them exist whilst they are not perceived. For, it is evident from sect. II and the following sections, that the Matter philosophers contend for is an incomprehensible somewhat, which hath none of those particular qualities whereby the bodies falling under our senses are distinguished one from another. But, to make this more plain, it must be remarked that the infinite divisibility of Matter is now universally allowed, at least by the most approved and considerable philosophers, who on the received principles demonstrate it beyond all exception. Hence, it follows there is an infinite number of parts in each particle of Matter which are not perceived by sense. The reason therefore that any particular body seems to be of a finite magnitude, or exhibits only a finite number of parts to sense, is, not because it contains no more, since in itself it contains an infinite number of parts, but because the sense is not acute enough to discern them. In proportion therefore as the sense is rendered more acute, it perceives a greater number of parts in the object, that is, the object appears greater, and its figure varies, those parts in its extremities which were before unperceivable appearing now to bound it in very different lines and angles from those perceived by an obtuser sense. And at length, after various changes of size and shape, when the sense becomes infinitely acute the body shall seem infinite. During all which there is no alteration in the body, but only in the sense. Each body therefore, considered in itself, is infinitely extended, and consequently void of all shape or figure. From which it follows that, though we should grant the existence of Matter to be never so certain, yet it is withal as certain, the materialists themselves are by their own principles forced to acknowledge, that neither the particular bodies perceived by sense, nor anything like them, exists without the mind. Matter, I say, and each particle thereof, is according to them infinite and shapeless, and it is the mind that frames all that variety of bodies which compose the visible world, any one whereof does not exist longer than it is perceived.

48. If we consider it, the objection proposed in sect. 45 will not be found reasonably charged on the

principles we have premised, so as in truth to make any objection at all against our notions. For, though we hold indeed the objects of sense to be nothing else but ideas which cannot exist unperceived; yet we may not hence conclude they have no existence except only while they are perceived by us, since there may be some other spirit that perceives them though we do not. Wherever bodies are said to have no existence without the mind, I would not be understood to mean this or that particular mind, but all minds whatsoever. It does not therefore follow from the foregoing principles that bodies are annihilated and created every moment, or exist not at all during the intervals between our perception of them.

49. Fifthly, it may perhaps be objected that if extension and figure exist only in the mind, it follows that the mind is extended and figured; since extension is a mode or attribute which (to speak with the schools) is predicated of the subject in which it exists. I answer, those qualities are in the mind only as they are perceived by it- that is, not by way of mode or attribute, but only by way of idea; and it no more follows the soul or mind is extended, because extension exists in it alone, than it does that it is red or blue, because those colours are on all hands acknowledged to exist in it, and nowhere else. As to what philosophers say of subject and mode, that seems very groundless and unintelligible. For instance, in this proposition "a die is hard, extended, and square," they will have it that the word die denotes a subject or substance, distinct from the hardness, extension, and figure which are predicated of it, and in which they exist. This I cannot comprehend: to me a die seems to be nothing distinct from those things which are termed its modes or accidents. And, to say a die is hard, extended, and square is not to attribute those qualities to a subject distinct from and supporting them, but only an explication of the meaning of the word die.

50. Sixthly, you will say there have been a great many things explained by matter and motion; take away these and you destroy the whole corpuscular philosophy, and undermine those mechanical principles which have been applied with so much success to account for the phenomena. In short, whatever advances have been made, either by ancient or modern philosophers, in the study of nature do all proceed on the supposition that corporeal substance or Matter doth really exist. To this I answer that there is not any one phenomenon explained on that supposition which may not as well be explained without it, as might easily be made appear by an induction of particulars. To explain the phenomena, is all one as to shew why, upon such and such occasions, we are affected with such and such ideas. But how Matter should operate on a Spirit, or produce any idea in it, is what no philosopher will pretend to explain; it is therefore evident there can be no use of Matter in natural philosophy. Besides, they who attempt to account for things do it not by corporeal substance, but by figure, motion, and other qualities, which are in truth no more than mere ideas, and, therefore, cannot be the cause of anything, as hath been already shewn. See sect. 25.

51. Seventhly, it will upon this be demanded whether it does not seem absurd to take away natural causes, and ascribe everything to the immediate operation of Spirits? We must no longer say upon these principles that fire heats, or water cools, but that a Spirit heats, and so forth. Would not a man be deservedly laughed at, who should talk after this manner? I answer, he would so; in such things we ought to "think with the learned, and speak with the vulgar." They who to demonstration are convinced of the truth of the Copernican system do nevertheless say "the sun rises," "the sun sets," or "comes to the meridian"; and if they affected a contrary style in common talk it would without doubt appear very ridiculous. A little reflexion on what is here said will make it manifest that the common use of language would receive no manner of alteration or disturbance from the admission of our tenets.

52. In the ordinary affairs of life, any phrases may be retained, so long as they excite in us proper

sentiments, or dispositions to act in such a manner as is necessary for our well-being, how false soever they may be if taken in a strict and speculative sense. Nay, this is unavoidable, since, propriety being regulated by custom, language is suited to the received opinions, which are not always the truest. Hence it is impossible, even in the most rigid, philosophic reasonings, so far to alter the bent and genius of the tongue we speak, as never to give a handle for cavillers to pretend difficulties and inconsistencies. But, a fair and ingenuous reader will collect the sense from the scope and tenor and connexion of a discourse, making allowances for those inaccurate modes of speech which use has made inevitable.

53. As to the opinion that there are no Corporeal Causes, this has been heretofore maintained by some of the Schoolmen, as it is of late by others among the modern philosophers, who though they allow Matter to exist, yet will have God alone to be the immediate efficient cause of all things. These men saw that amongst all the objects of sense there was none which had any power or activity included in it; and that by consequence this was likewise true of whatever bodies they supposed to exist without the mind, like unto the immediate objects of sense. But then, that they should suppose an innumerable multitude of created beings, which they acknowledge are not capable of producing any one effect in nature, and which therefore are made to no manner of purpose, since God might have done everything as well without them: this I say, though we should allow it possible, must yet be a very unaccountable and extravagant supposition.

54. In the eighth place, the universal concurrent assent of mankind may be thought by some an invincible argument in behalf of Matter, or the existence of external things. Must we suppose the whole world to be mistaken? And if so, what cause can be assigned of so widespread and predominant an error? I answer, first, that, upon a narrow inquiry, it will not perhaps be found so many as is imagined do really believe the existence of Matter or things without the mind. Strictly speaking, to believe that which involves a contradiction, or has no meaning in it, is impossible; and whether the foregoing expressions are not of that sort, I refer it to the impartial examination of the reader. In one sense, indeed, men may be said to believe that Matter exists, that is, they act as if the immediate cause of their sensations, which affects them every moment, and is so nearly present to them, were some senseless unthinking being. But, that they should clearly apprehend any meaning marked by those words, and form thereof a settled speculative opinion, is what I am not able to conceive. This is not the only instance wherein men impose upon themselves, by imagining they believe those propositions which they have often heard, though at bottom they have no meaning in them.

55. But secondly, though we should grant a notion to be never so universally and steadfastly adhered to, yet this is weak argument of its truth to whoever considers what a vast number of prejudices and false opinions are everywhere embraced with the utmost tenaciousness, by the unreflecting (which are the far greater) part of mankind. There was a time when the antipodes and motion of the earth were looked upon as monstrous absurdities even by men of learning: and if it be considered what a small proportion they bear to the rest of mankind, we shall find that at this day those notions have gained but a very inconsiderable footing in the world.

56. But it is demanded that we assign a cause of this prejudice, and account for its obtaining in the world. To this I answer, that men knowing they perceived several ideas, whereof they themselves were not the authors- as not being excited from within nor depending on the operation of their wills- this made them maintain those ideas, or objects of perception had an existence independent of and without the mind, without ever dreaming that a contradiction was involved in those words. But, philosophers having plainly seen that the immediate objects of perception do not exist without

the mind, they in some degree corrected the mistake of the vulgar; but at the same time run into another which seems no less absurd, to wit, that there are certain objects really existing without the mind, or having a subsistence distinct from being perceived, of which our ideas are only images or resemblances, imprinted by those objects on the mind. And this notion of the philosophers owes its origin to the same cause with the former, namely, their being conscious that they were not the authors of their own sensations, which they evidently knew were imprinted from without, and which therefore must have some cause distinct from the minds on which they are imprinted.

57. But why they should suppose the ideas of sense to be excited in us by things in their likeness, and not rather have recourse to Spirit which alone can act, may be accounted for, first, because they were not aware of the repugnancy there is, as well in supposing things like unto our ideas existing without, as in attributing to them power or activity. Secondly, because the Supreme Spirit which excites those ideas in our minds, is not marked out and limited to our view by any particular finite collection of sensible ideas, as human agents are by their size, complexion, limbs, and motions. And thirdly, because His operations are regular and uniform. Whenever the course of nature is interrupted by a miracle, men are ready to own the presence of a superior agent. But, when we see things go on in the ordinary course they do not excite in us any reflexion; their order and concatenation, though it be an argument of the greatest wisdom, power, and goodness in their creator, is yet so constant and familiar to us that we do not think them the immediate effects of a Free Spirit; especially since inconsistency and mutability in acting, though it be an imperfection, is looked on as a mark of freedom.

58. Tenthly, it will be objected that the notions we advance are inconsistent with several sound truths in philosophy and mathematics. For example, the motion of the earth is now universally admitted by astronomers as a truth grounded on the clearest and most convincing reasons. But, on the foregoing principles, there can be no such thing. For, motion being only an idea, it follows that if it be not perceived it exists not; but the motion of the earth is not perceived by sense. I answer, that tenet, if rightly understood, will be found to agree with the principles we have premised; for, the question whether the earth moves or no amounts in reality to no more than this, to wit, whether we have reason to conclude, from what has been observed by astronomers, that if we were placed in such and such circumstances, and such or such a position and distance both from the earth and sun, we should perceive the former to move among the choir of the planets, and appearing in all respects like one of them; and this, by the established rules of nature which we have no reason to mistrust, is reasonably collected from the phenomena.

59. We may, from the experience we have had of the train and succession of ideas in our minds, often make, I will not say uncertain conjectures, but sure and well-grounded predictions concerning the ideas we shall be affected with pursuant to a great train of actions, and be enabled to pass a right judgment of what would have appeared to us, in case we were placed in circumstances very different from those we are in at present. Herein consists the knowledge of nature, which may preserve its use and certainty very consistently with what hath been said. It will be easy to apply this to whatever objections of the like sort may be drawn from the magnitude of the stars, or any other discoveries in astronomy or nature.

60. In the eleventh place, it will be demanded to what purpose serves that curious organization of plants, and the animal mechanism in the parts of animals; might not vegetables grow, and shoot forth leaves of blossoms, and animals perform all their motions as well without as with all that variety of internal parts so elegantly contrived and put together; which, being ideas, have nothing powerful or operative in them, nor have any necessary connexion with the effects ascribed to

them? If it be a Spirit that immediately produces every effect by a fiat or act of his will, we must think all that is fine and artificial in the works, whether of man or nature, to be made in vain. By this doctrine, though an artist hath made the spring and wheels, and every movement of a watch, and adjusted them in such a manner as he knew would produce the motions he designed, yet he must think all this done to no purpose, and that it is an Intelligence which directs the index, and points to the hour of the day. If so, why may not the Intelligence do it, without his being at the pains of making the movements and putting them together? Why does not an empty case serve as well as another? And how comes it to pass that whenever there is any fault in the going of a watch, there is some corresponding disorder to be found in the movements, which being mended by a skilful hand all is right again? The like may be said of all the clockwork of nature, great part whereof is so wonderfully fine and subtle as scarce to be discerned by the best microscope. In short, it will be asked, how, upon our principles, any tolerable account can be given, or any final cause assigned of an innumerable multitude of bodies and machines, framed with the most exquisite art, which in the common philosophy have very apposite uses assigned them, and serve to explain abundance of phenomena?

61. To all which I answer, first, that though there were some difficulties relating to the administration of Providence, and the uses by it assigned to the several parts of nature, which I could not solve by the foregoing principles, yet this objection could be of small weight against the truth and certainty of those things which may be proved a priori, with the utmost evidence and rigor of demonstration. Secondly, but neither are the received principles free from the like difficulties; for, it may still be demanded to what end God should take those roundabout methods of effecting things by instruments and machines, which no one can deny might have been effected by the mere command of His will without all that apparatus; nay, if we narrowly consider it, we shall find the objection may be retorted with greater force on those who hold the existence of those machines without of mind; for it has been made evident that solidity, bulk, figure, motion, and the like have no activity or efficacy in them, so as to be capable of producing any one effect in nature. See sect. 25. Whoever therefore supposes them to exist (allowing the supposition possible) when they are not perceived does it manifestly to no purpose; since the only use that is assigned to them, as they exist unperceived, is that they produce those perceivable effects which in truth cannot be ascribed to anything but Spirit.

62. But, to come nigher the difficulty, it must be observed that though the fabrication of all those parts and organs be not absolutely necessary to the producing any effect, yet it is necessary to the producing of things in a constant regular way according to the laws of nature. There are certain general laws that run through the whole chain of natural effects; these are learned by the observation and study of nature, and are by men applied as well to the framing artificial things for the use and ornament of life as to the explaining various phenomena- which explication consists only in shewing the conformity any particular phenomenon hath to the general laws of nature, or, which is the same thing, in discovering the uniformity there is in the production of natural effects; as will be evident to whoever shall attend to the several instances wherein philosophers pretend to account for appearances. That there is a great and conspicuous use in these regular constant methods of working observed by the Supreme Agent hath been shewn in sect. 31. And it is no less visible that a particular size, figure, motion, and disposition of parts are necessary, though not absolutely to the producing any effect, yet to the producing it according to the standing mechanical laws of nature. Thus, for instance, it cannot be denied that God, or the Intelligence that sustains and rules the ordinary course of things, might if He were minded to produce a miracle, cause all

the motions on the dial-plate of a watch, though nobody had ever made the movements and put them in it: but yet, if He will act agreeably to the rules of mechanism, by Him for wise ends established and maintained in the creation, it is necessary that those actions of the watchmaker, whereby he makes the movements and rightly adjusts them, precede the production of the aforesaid motions; as also that any disorder in them be attended with the perception of some corresponding disorder in the movements, which being once corrected all is right again.

63. It may indeed on some occasions be necessary that the Author of nature display His overruling power in producing some appearance out of the ordinary series of things. Such exceptions from the general rules of nature are proper to surprise and awe men into an acknowledgement of the Divine Being; but then they are to be used but seldom, otherwise there is a plain reason why they should fail of that effect. Besides, God seems to choose the convincing our reason of His attributes by the works of nature, which discover so much harmony and contrivance in their make, and are such plain indications of wisdom and beneficence in their Author, rather than to astonish us into a belief of His Being by anomalous and surprising events.

64. To set this matter in a yet clearer light, I shall observe that what has been objected in sect. 60 amounts in reality to no more than this:- ideas are not anyhow and at random produced, there being a certain order and connexion between them, like to that of cause and effect; there are also several combinations of them made in a very regular and artificial manner, which seem like so many instruments in the hand of nature that, being hid as it were behind the scenes, have a secret operation in producing those appearances which are seen on the theatre of the world, being themselves discernible only to the curious eye of the philosopher. But, since one idea cannot be the cause of another, to what purpose is that connexion? And, since those instruments, being barely inefficacious perceptions in the mind, are not subservient to the production of natural effects, it is demanded why they are made; or, in other words, what reason can be assigned why God should make us, upon a close inspection into His works, behold so great variety of ideas so artfully laid together, and so much according to rule; it not being credible that He would be at the expense (if one may so speak) of all that art and regularity to no purpose.

65. To all which my answer is, first, that the connexion of ideas does not imply the relation of cause and effect, but only of a mark or sign with the thing signified. The fire which I see is not the cause of the pain I suffer upon my approaching it, but the mark that forewarns me of it. In like manner the noise that I hear is not the effect of this or that motion or collision of the ambient bodies, but the sign thereof. Secondly, the reason why ideas are formed into machines, that is, artificial and regular combinations, is the same with that for combining letters into words. That a few original ideas may be made to signify a great number of effects and actions, it is necessary they be variously combined together. And, to the end their use be permanent and universal, these combinations must be made by rule, and with wise contrivance. By this means abundance of information is conveyed unto us, concerning what we are to expect from such and such actions and what methods are proper to be taken for the exciting such and such ideas; which in effect is all that I conceive to be distinctly meant when it is said that, by discerning a figure, texture, and mechanism of the inward parts of bodies, whether natural or artificial, we may attain to know the several uses and properties depending thereon, or the nature of the thing.

66. Hence, it is evident that those things which, under the notion of a cause co-operating or concurring to the production of effects, are altogether inexplicable, and run us into great absurdities, may be very naturally explained, and have a proper and obvious use assigned to them, when they are considered only as marks or signs for our information. And it is the searching after

and endeavouring to understand those signs instituted by the Author of Nature, that ought to be the employment of the natural philosopher; and not the pretending to explain things by corporeal causes, which doctrine seems to have too much estranged the minds of men from that active principle, that supreme and wise Spirit "in whom we live, move, and have our being."

67. In the twelfth place, it may perhaps be objected that- though it be clear from what has been said that there can be no such thing as an inert, senseless, extended, solid, figured, movable substance existing without the mind, such as philosophers describe Matter- yet, if any man shall leave out of his idea of matter the positive ideas of extension, figure, solidity and motion, and say that he means only by that word an inert, senseless substance, that exists without the mind or unperceived, which is the occasion of our ideas, or at the presence whereof God is pleased to excite ideas in us: it doth not appear but that Matter taken in this sense may possibly exist. In answer to which I say, first, that it seems no less absurd to suppose a substance without accidents, than it is to suppose accidents without a substance. But secondly, though we should grant this unknown substance may possibly exist, yet where can it be supposed to be? That it exists not in the mind is agreed; and that it exists not in place is no less certain- since all place or extension exists only in the mind, as hath been already proved. It remains therefore that it exists nowhere at all.

68. Let us examine a little the description that is here given us of matter. It neither acts, nor perceives, nor is perceived; for this is all that is meant by saying it is an inert, senseless, unknown substance; which is a definition entirely made up of negatives, excepting only the relative notion of its standing under or supporting. But then it must be observed that it supports nothing at all, and how nearly this comes to the description of a nonentity I desire may be considered. But, say you, it is the unknown occasion, at the presence of which ideas are excited in us by the will of God. Now, I would fain know how anything can be present to us, which is neither perceivable by sense nor reflexion, nor capable of producing any idea in our minds, nor is at all extended, nor hath any form, nor exists in any place. The words "to be present," when thus applied, must needs be taken in some abstract and strange meaning, and which I am not able to comprehend.

69. Again, let us examine what is meant by occasion. So far as I can gather from the common use of language, that word signifies either the agent which produces any effect, or else something that is observed to accompany or go before it in the ordinary course of things. But when it is applied to Matter as above described, it can be taken in neither of those senses; for Matter is said to be passive and inert, and so cannot be an agent or efficient cause. It is also unperceivable, as being devoid of all sensible qualities, and so cannot be the occasion of our perceptions in the latter sense: as when the burning my finger is said to be the occasion of the pain that attends it. What therefore can be meant by calling matter an occasion? The term is either used in no sense at all, or else in some very distant from its received signification.

70. You will Perhaps say that Matter, though it be not perceived by us, is nevertheless perceived by God, to whom it is the occasion of exciting ideas in our minds. For, say you, since we observe our sensations to be imprinted in an orderly and constant manner, it is but reasonable to suppose there are certain constant and regular occasions of their being produced. That is to say, that there are certain permanent and distinct parcels of Matter, corresponding to our ideas, which, though they do not excite them in our minds, or anywise immediately affect us, as being altogether passive and unperceivable to us, they are nevertheless to God, by whom they art perceived, as it were so many occasions to remind Him when and what ideas to imprint on our minds; that so things may go on in a constant uniform manner.

71. In answer to this, I observe that, as the notion of Matter is here stated, the question is no longer concerning the existence of a thing distinct from Spirit and idea, from perceiving and being perceived; but whether there are not certain ideas of I know not what sort, in the mind of God which are so many marks or notes that direct Him how to produce sensations in our minds in a constant and regular method- much after the same manner as a musician is directed by the notes of music to produce that harmonious train and composition of sound which is called a tune, though they who hear the music do not perceive the notes, and may be entirely ignorant of them. But, this notion of Matter seems too extravagant to deserve a confutation. Besides, it is in effect no objection against what we have advanced, viz. that there is no senseless unperceived substance.

72. If we follow the light of reason, we shall, from the constant uniform method of our sensations, collect the goodness and wisdom of the Spirit who excites them in our minds; but this is all that I can see reasonably concluded from thence. To me, I say, it is evident that the being of a spirit infinitely wise, good, and powerful is abundantly sufficient to explain all the appearances of nature. But, as for inert, senseless Matter, nothing that I perceive has any the least connexion with it, or leads to the thoughts of it. And I would fain see any one explain any the meanest phenomenon in nature by it, or shew any manner of reason, though in the lowest rank of probability, that he can have for its existence, or even make any tolerable sense or meaning of that supposition. For, as to its being an occasion, we have, I think, evidently shewn that with regard to us it is no occasion. It remains therefore that it must be, if at all, the occasion to God of exciting ideas in us; and what this amounts to we have just now seen.

73. It is worth while to reflect a little on the motives which induced men to suppose the existence of material substance; that so having observed the gradual ceasing and expiration of those motives or reasons, we may proportionably withdraw the assent that was grounded on them. First, therefore, it was thought that colour, figure, motion, and the rest of the sensible qualities or accidents, did really exist without the mind; and for this reason it seemed needful to suppose some unthinking substratum or substance wherein they did exist, since they could not be conceived to exist by themselves. Afterwards, in process of time, men being convinced that colours, sounds, and the rest of the sensible, secondary qualities had no existence without the mind, they stripped this substratum or material substance of those qualities, leaving only the primary ones, figure, motion, and suchlike, which they still conceived to exist without the mind, and consequently to stand in need of a material support. But, it having been shewn that none even of these can possibly exist otherwise than in a Spirit or Mind which perceives them it follows that we have no longer any reason to suppose the being of Matter; nay, that it is utterly impossible there should be any such thing, so long as that word is taken to denote an unthinking substratum of qualities or accidents wherein they exist without the mind.

74. But though it be allowed by the materialists themselves that Matter was thought of only for the sake of supporting accidents, and, the reason entirely ceasing, one might expect the mind should naturally, and without any reluctance at all, quit the belief of what was solely grounded thereon; yet the prejudice is riveted so deeply in our thoughts, that we can scarce tell how to part with it, and are therefore inclined, since the thing itself is indefensible, at least to retain the name, which we apply to I know not what abstracted and indefinite notions of being, or occasion, though without any show of reason, at least so far as I can see. For, what is there on our part, or what do we perceive, amongst all the ideas, sensations, notions which are imprinted on our minds, either by sense or reflexion, from whence may be inferred the existence of an inert, thoughtless, unperceived occasion? and, on the other hand, on the part of an All-sufficient Spirit, what can there be that

should make us believe or even suspect He is directed by an inert occasion to excite ideas in our minds?

75. It is a very extraordinary instance of the force of prejudice, and much to be lamented, that the mind of man retains so great a fondness, against all the evidence of reason, for a stupid thoughtless somewhat, by the interposition whereof it would as it were screen itself from the Providence of God, and remove it farther off from the affairs of the world. But, though we do the utmost we can to secure the belief of Matter, though, when reason forsakes us, we endeavour to support our opinion on the bare possibility of the thing, and though we indulge ourselves in the full scope of an imagination not regulated by reason to make out that poor possibility, yet the upshot of all is, that there are certain unknown Ideas in the mind of God; for this, if anything, is all that I conceive to be meant by occasion with regard to God. And this at the bottom is no longer contending for the thing, but for the name.

76. Whether therefore there are such Ideas in the mind of God, and whether they may be called by the name Matter, I shall not dispute. But, if you stick to the notion of an unthinking substance or support of extension, motion, and other sensible qualities, then to me it is most evidently impossible there should be any such thing, since it is a plain repugnancy that those qualities should exist in or be supported by an unperceiving substance.

77. But, say you, though it be granted that there is no thoughtless support of extension and the other qualities or accidents which we perceive, yet there may perhaps be some inert, unperceiving substance or substratum of some other qualities, as incomprehensible to us as colours are to a man born blind, because we have not a sense adapted to them. But, if we had a new sense, we should possibly no more doubt of their existence than a blind man made to see does of the existence of light and colours. I answer, first, if what you mean by the word Matter be only the unknown support of unknown qualities, it is no matter whether there is such a thing or no, since it no way concerns us; and I do not see the advantage there is in disputing about what we know not what, and we know not why.

78. But, secondly, if we had a new sense it could only furnish us with new ideas or sensations; and then we should have the same reason against their existing in an unperceiving substance that has been already offered with relation to figure, motion, colour and the like. Qualities, as hath been shewn, are nothing else but sensations or ideas, which exist only in a mind perceiving them; and this is true not only of the ideas we are acquainted with at present, but likewise of all possible ideas whatsoever.

79. But, you will insist, what if I have no reason to believe the existence of Matter? what if I cannot assign any use to it or explain anything by it, or even conceive what is meant by that word? yet still it is no contradiction to say that Matter exists, and that this Matter is in general a substance, or occasion of ideas; though indeed to go about to unfold the meaning or adhere to any particular explication of those words may be attended with great difficulties. I answer, when words are used without a meaning, you may put them together as you please without danger of running into a contradiction. You may say, for example, that twice two is equal to seven, so long as you declare you do not take the words of that proposition in their usual acceptation but for marks of you know not what. And, by the same reason, you may say there is an inert thoughtless substance without accidents which is the occasion of our ideas. And we shall understand just as much by one proposition as the other.

80. In the last place, you will say, what if we give up the cause of material Substance, and stand to

it that Matter is an unknown somewhat- neither substance nor accident, spirit nor idea, inert, thoughtless, indivisible, immovable, unextended, existing in no place. For, say you, whatever may be urged against substance or occasion, or any other positive or relative notion of Matter, hath no place at all, so long as this negative definition of Matter is adhered to. I answer, you may, if so it shall seem good, use the word "Matter" in the same sense as other men use "nothing," and so make those terms convertible in your style. For, after all, this is what appears to me to be the result of that definition, the parts whereof when I consider with attention, either collectively or separate from each other, I do not find that there is any kind of effect or impression made on my mind different from what is excited by the term nothing.

81. You will reply, perhaps, that in the fore-said definition is included what doth sufficiently distinguish it from nothing- the positive abstract idea of quiddity, entity, or existence. I own, indeed, that those who pretend to the faculty of framing abstract general ideas do talk as if they had such an idea, which is, say they, the most abstract and general notion of all; that is, to me, the most incomprehensible of all others. That there are a great variety of spirits of different orders and capacities, whose faculties both in number and extent are far exceeding those the Author of my being has bestowed on me, I see no reason to deny. And for me to pretend to determine by my own few, stinted narrow inlets of perception, what ideas the inexhaustible power of the Supreme Spirit may imprint upon them were certainly the utmost folly and presumption- since there may be, for aught that I know, innumerable sorts of ideas or sensations, as different from one another, and from all that I have perceived, as colours are from sounds. But, how ready soever I may be to acknowledge the scantiness of my comprehension with regard to the endless variety of spirits and ideas that may possibly exist, yet for any one to pretend to a notion of Entity or Existence, abstracted from spirit and idea, from perceived and being perceived, is, I suspect, a downright repugnancy and trifling with words.- It remains that we consider the objections which may possibly be made on the part of Religion.

82. Some there are who think that, though the arguments for the real existence of bodies which are drawn from Reason be allowed not to amount to demonstration, yet the Holy Scriptures are so clear in the point as will sufficiently convince every good Christian that bodies do really exist, and are something more than mere ideas; there being in Holy Writ innumerable facts related which evidently suppose the reality of timber and stone, mountains and rivers, and cities, and human bodies. To which I answer that no sort of writings whatever, sacred or profane, which use those and the like words in the vulgar acceptation, or so as to have a meaning in them, are in danger of having their truth called in question by our doctrine. That all those things do really exist, that there are bodies, even corporeal substances, when taken in the vulgar sense, has been shewn to be agreeable to our principles; and the difference betwixt things and ideas, realities and chimeras, has been distinctly explained. See sect. 29, 30, 33, 36, &c. And I do not think that either what philosophers call Matter, or the existence of objects without the mind, is anywhere mentioned in Scripture.

83. Again, whether there can be or be not external things, it is agreed on all hands that the proper use of words is the marking our conceptions, or things only as they are known and perceived by us; whence it plainly follows that in the tenets we have laid down there is nothing inconsistent with the right use and significancy of language, and that discourse, of what kind soever, so far as it is intelligible, remains undisturbed. But all this seems so manifest, from what has been largely set forth in the premises, that it is needless to insist any farther on it.

84. But, it will be urged that miracles do, at least, lose much of their stress and import by our

principles. What must we think of Moses' rod? was it not really turned into a serpent; or was there only a change of ideas in the minds of the spectators? And, can it be supposed that our Saviour did no more at the marriage-feast in Cana than impose on the sight, and smell, and taste of the guests, so as to create in them the appearance or idea only of wine? The same may be said of all other miracles; which, in consequence of the foregoing principles, must be looked upon only as so many cheats, or illusions of fancy. To this I reply, that the rod was changed into a real serpent, and the water into real wine. That this does not in the least contradict what I have elsewhere said will be evident from sect. 34 and 35. But this business of real and imaginary has been already so plainly and fully explained, and so often referred to, and the difficulties about it are so easily answered from what has gone before, that it were an affront to the reader's understanding to resume the explication of it in its place. I shall only observe that if at table all who were present should see, and smell, and taste, and drink wine, and find the effects of it, with me there could be no doubt of its reality; so that at bottom the scruple concerning real miracles has no place at all on ours, but only on the received principles, and consequently makes rather for than against what has been said.

85. Having done with the Objections, which I endeavoured to propose in the clearest light, and gave them all the force and weight I could, we proceed in the next place to take a view of our tenets in their Consequences. Some of these appear at first sight- as that several difficult and obscure questions, on which abundance of speculation has been thrown away, are entirely banished from philosophy. "Whether corporeal substance can think," "whether Matter be infinitely divisible," and "how it operates on spirit"- these and like inquiries have given infinite amusement to philosophers in all ages; but depending on the existence of Matter, they have no longer any place on our principles. Many other advantages there are, as well with regard to religion as the sciences, which it is easy for any one to deduce from what has been premised; but this will appear more plainly in the sequel.

86. From the principles we have laid down it follows human knowledge may naturally be reduced to two heads- that of ideas and that of spirits. Of each of these I shall treat in order.

And first as to ideas or unthinking things. Our knowledge of these hath been very much obscured and confounded, and we have been led into very dangerous errors, by supposing a twofold existence of the objects of sense- the one intelligible or in the mind, the other real and without the mind; whereby unthinking things are thought to have a natural subsistence of their own distinct from being perceived by spirits. This, which, if I mistake not, hath been shewn to be a most groundless and absurd notion, is the very root of Scepticism; for, so long as men thought that real things subsisted without the mind, and that their knowledge was only so far forth real as it was conformable to real things, it follows they could not be certain they had any real knowledge at all. For how can it be known that the things which are perceived are conformable to those which are not perceived, or exist without the mind?

87. Colour, figure, motion, extension, and the like, considered only as so many sensations in the mind, are perfectly known, there being nothing in them which is not perceived. But, if they are looked on as notes or images, referred to things or archetypes existing without the mind, then are we involved all in scepticism. We see only the appearances, and not the real qualities of things. What may be the extension, figure, or motion of anything really and absolutely, or in itself, it is impossible for us to know, but only the proportion or relation they bear to our senses. Things remaining the same, our ideas vary, and which of them, or even whether any of them at all, represent the true quality really existing in the thing, it is out of our reach to determine. So that, for aught we know, all we see, hear, and feel may be only phantom and vain chimera, and not at all

agree with the real things existing in rerum natura. All this scepticism follows from our supposing a difference between things and ideas, and that the former have a subsistence without the mind or unperceived. It were easy to dilate on this subject, and show how the arguments urged by sceptics in all ages depend on the supposition of external objects.

88. So long as we attribute a real existence to unthinking things, distinct from their being perceived, it is not only impossible for us to know with evidence the nature of any real unthinking being, but even that it exists. Hence it is that we see philosophers distrust their senses, and doubt of the existence of heaven and earth, of everything they see or feel, even of their own bodies. And, after all their labour and struggle of thought, they are forced to own we cannot attain to any self-evident or demonstrative knowledge of the existence of sensible things. But, all this doubtfulness, which so bewilders and confounds the mind and makes philosophy ridiculous in the eyes of the world, vanishes if we annex a meaning to our words. and not amuse ourselves with the terms "absolute," "external," "exist, "and such-like, signifying we know not what. I can as well doubt of my own being as of the being of those things which I actually perceive by sense; it being a manifest contradiction that any sensible object should be immediately perceived by sight or touch, and at the same time have no existence in nature, since the very existence of an unthinking being consists in being perceived.

89. Nothing seems of more importance towards erecting a firm system of sound and real knowledge, which may be proof against the assaults of Scepticism, than to lay the beginning in a distinct explication of what is meant by thing, reality, existence; for in vain shall we dispute concerning the real existence of things, or pretend to any knowledge thereof, so long as we have not fixed the meaning of those words. Thing or Being is the most general name of all; it comprehends under it two kinds entirely distinct and heterogeneous, and which have nothing common but the name. viz. spirits and ideas. The former are active, indivisible substances: the latter are inert, fleeting, dependent beings, which subsist not by themselves, but are supported by, or exist in minds or spiritual substances. We comprehend our own existence by inward feeling or reflexion, and that of other spirits by reason. We may be said to have some knowledge or notion of our own minds, of spirits and active beings, whereof in a strict sense we have not ideas. In like manner, we know and have a notion of relations between things or ideas- which relations are distinct from the ideas or things related, inasmuch as the latter may be perceived by us without our perceiving the former. To me it seems that ideas, spirits, and relations are all in their respective kinds the object of human knowledge and subject of discourse; and that the term idea would be improperly extended to signify everything we know or have any notion of.

90. Ideas imprinted on the senses are real things, or do really exist; this we do not deny, but we deny they can subsist without the minds which perceive them, or that they are resemblances of any archetypes existing without the mind; since the very being of a sensation or idea consists in being perceived, and an idea can be like nothing but an idea. Again, the things perceived by sense may be termed external, with regard to their origin- in that they are not generated from within by the mind itself, but imprinted by a Spirit distinct from that which perceives them. Sensible objects may likewise be said to be "without the mind" in another sense, namely when they exist in some other mind; thus, when I shut my eyes, the things I saw may still exist, but it must be in another mind.

91. It were a mistake to think that what is here said derogates in the least from the reality of things. It is acknowledged, on the received principles, that extension, motion, and in a word all sensible qualities have need of a support, as not being able to subsist by themselves. But the objects perceived by sense are allowed to be nothing but combinations of those qualities, and consequently

cannot subsist by themselves. Thus far it is agreed on all hand. So that in denying the things perceived by sense an existence independent of a substance of support wherein they may exist, we detract nothing from the received opinion of their reality, and are guilty of no innovation in that respect. All the difference is that, according to us, the unthinking beings perceived by sense have no existence distinct from being perceived, and cannot therefore exist in any other substance than those unextended indivisible substances or spirits which act and think and perceive them; whereas philosophers vulgarly hold that the sensible qualities do exist in an inert, extended, unperceiving substance which they call Matter, to which they attribute a natural subsistence, exterior to all thinking beings, or distinct from being perceived by any mind whatsoever, even the eternal mind of the Creator, wherein they suppose only ideas of the corporeal substances created by him; if indeed they allow them to be at all created.

92. For, as we have shewn the doctrine of Matter or corporeal substance to have been the main pillar and support of Scepticism, so likewise upon the same foundation have been raised all the impious schemes of Atheism and Irreligion. Nay, so great a difficulty has it been thought to conceive Matter produced out of nothing, that the most celebrated among the ancient philosophers, even of those who maintained the being of a God, have thought Matter to be uncreated and co-eternal with Him. How great a friend material substance has been to Atheists in all ages were needless to relate. All their monstrous systems have so visible and necessary a dependence on it that, when this corner-stone is once removed, the whole fabric cannot choose but fall to the ground, insomuch that it is no longer worth while to bestow a particular consideration on the absurdities of every wretched sect of Atheists.

93. That impious and profane persons should readily fall in with those systems which favour their inclinations, by deriding immaterial substance, and supposing the soul to be divisible and subject to corruption as the body; which exclude all freedom, intelligence, and design from the formation of things, and instead thereof make a self-existent, stupid, unthinking substance the root and origin of all beings; that they should hearken to those who deny a Providence, or inspection of a Superior Mind over the affairs of the world, attributing the whole series of events either to blind chance or fatal necessity arising from the impulse of one body or another- all this is very natural. And, on the other hand, when men of better principles observe the enemies of religion lay so great a stress on unthinking Matter, and all of them use so much industry and artifice to reduce everything to it, methinks they should rejoice to see them deprived of their grand support, and driven from that only fortress, without which your Epicureans, Hobbists, and the like, have not even the shadow of a pretence, but become the most cheap and easy triumph in the world.

94. The existence of Matter, or bodies unperceived, has not only been the main support of Atheists and Fatalists, but on the same principle doth Idolatry likewise in all its various forms depend. Did men but consider that the sun, moon, and stars, and every other object of the senses are only so many sensations in their minds, which have no other existence but barely being perceived, doubtless they would never fall down and worship their own ideas, but rather address their homage to that ETERNAL INVISIBLE MIND which produces and sustains all things.

95. The same absurd principle, by mingling itself with the articles of our faith, has occasioned no small difficulties to Christians. For example, about the Resurrection, how many scruples and objections have been raised by Socinians and others? But do not the most plausible of them depend on the supposition that a body is denominated the same, with regard not to the form or that which is perceived by sense, but the material substance, which remains the same under several forms? Take away this material substance, about the identity whereof all the dispute is, and mean by body

what every plain ordinary person means by that word, to wit, that which is immediately seen and felt, which is only a combination of sensible qualities or ideas, and then their most unanswerable objections come to nothing.

96. Matter being once expelled out of nature drags with it so many sceptical and impious notions, such an incredible number of disputes and puzzling questions, which have been thorns in the sides of divines as well as philosophers, and made so much fruitless work for mankind, that if the arguments we have produced against it are not found equal to demonstration (as to me they evidently seem), yet I am sure all friends to knowledge, peace, and religion have reason to wish they were.

97. Beside the external existence of the objects of perception, another great source of errors and difficulties with regard to ideal knowledge is the doctrine of abstract ideas, such as it hath been set forth in the Introduction. The plainest things in the world, those we are most intimately acquainted with and perfectly know, when they are considered in an abstract way, appear strangely difficult and incomprehensible. Time, place, and motion, taken in particular or concrete, are what everybody knows, but, having passed through the hands of a metaphysician, they become too abstract and fine to be apprehended by men of ordinary sense. Bid your servant meet you at such a time in such a place, and he shall never stay to deliberate on the meaning of those words; in conceiving that particular time and place, or the motion by which he is to get thither, he finds not the least difficulty. But if time be taken exclusive of all those particular actions and ideas that diversify the day, merely for the continuation of existence or duration in abstract, then it will perhaps gravel even a philosopher to comprehend it.

98. For my own part, whenever I attempt to frame a simple idea of time, abstracted from the succession of ideas in my mind, which flows uniformly and is participated by all beings, I am lost and embrangled in inextricable difficulties. I have no notion of it at all, only I hear others say it is infinitely divisible, and speak of it in such a manner as leads me to entertain odd thoughts of my existence; since that doctrine lays one under an absolute necessity of thinking, either that he passes away innumerable ages without a thought, or else that he is annihilated every moment of his life, both which seem equally absurd. Time therefore being nothing, abstracted from the sucession of ideas in our minds, it follows that the duration of any finite spirit must be estimated by the number of ideas or actions succeeding each other in that same spirit or mind. Hence, it is a plain consequence that the soul always thinks; and in truth whoever shall go about to divide in his thoughts, or abstract the existence of a spirit from its cogitation, will, I believe, find it no easy task.

99. So likewise when we attempt to abstract extension and motion from all other qualities, and consider them by themselves, we presently lose sight of them, and run into great extravagances. All which depend on a twofold abstraction; first, it is supposed that extension, for example, may be abstracted from all other sensible qualities; and secondly, that the entity of extension may be abstracted from its being perceived. But, whoever shall reflect, and take care to understand what he says, will, if I mistake not, acknowledge that all sensible qualities are alike sensations and alike real; that where the extension is, there is the colour, too, i.e., in his mind, and that their archetypes can exist only in some other mind; and that the objects of sense are nothing but those sensations combined, blended, or (if one may so speak) concreted together; none of all which can be supposed to exist unperceived.

100. What it is for a man to be happy, or an object good, every one may think he knows. But to frame an abstract idea of happiness, prescinded from all particular pleasure, or of goodness from

everything that is good, this is what few can pretend to. So likewise a man may be just and virtuous without having precise ideas of justice and virtue. The opinion that those and the like words stand for general notions, abstracted from all particular persons and actions, seems to have rendered morality very difficult, and the study thereof of small use to mankind. And in effect the doctrine of abstraction has not a little contributed towards spoiling the most useful parts of knowledge.

101. The two great provinces of speculative science conversant about ideas received from sense, are Natural Philosophy and Mathematics; with regard to each of these I shall make some observations. And first I shall say somewhat of Natural Philosophy. On this subject it is that the sceptics triumph. All that stock of arguments they produce to depreciate our faculties and make mankind appear ignorant and low, are drawn principally from this head, namely, that we are under an invincible blindness as to the true and real nature of things. This they exaggerate, and love to enlarge on. We are miserably bantered, say they, by our senses, and amused only with the outside and show of things. The real essence, the internal qualities and constitution of every the meanest object, is hid from our view; something there is in every drop of water, every grain of sand, which it is beyond the power of human understanding to fathom or comprehend. But, it is evident from what has been shewn that all this complaint is groundless, and that we are influenced by false principles to that degree as to mistrust our senses, and think we know nothing of those things which we perfectly comprehend.

102. One great inducement to our pronouncing ourselves ignorant of the nature of things is the current opinion that everything includes within itself the cause of its properties; or that there is in each object an inward essence which is the source whence its discernible qualities flow, and whereon they depend. Some have pretended to account for appearances by occult qualities, but of late they are mostly resolved into mechanical causes, to wit. the figure, motion, weight, and suchlike qualities, of insensible particles; whereas, in truth, there is no other agent or efficient cause than spirit, it being evident that motion, as well as all other ideas, is perfectly inert. See sect. 25. Hence, to endeavour to explain the production of colours or sounds, by figure, motion, magnitude, and the like, must needs be labour in vain. And accordingly we see the attempts of that kind are not at all satisfactory. Which may be said in general of those instances wherein one idea or quality is assigned for the cause of another. I need not say how many hypotheses and speculations are left out, and how much the study of nature is abridged by this doctrine.

103. The great mechanical principle now in vogue is attraction. That a stone falls to the earth, or the sea swells towards the moon, may to some appear sufficiently explained thereby. But how are we enlightened by being told this is done by attraction? Is it that that word signifies the manner of the tendency, and that it is by the mutual drawing of bodies instead of their being impelled or protruded towards each other? But, nothing is determined of the manner or action, and it may as truly (for aught we know) be termed "impulse," or "protrusion," as "attraction." Again, the parts of steel we see cohere firmly together, and this also is accounted for by attraction; but, in this as in the other instances, I do not perceive that anything is signified besides the effect itself; for as to the manner of the action whereby it is produced, or the cause which produces it, these are not so much as aimed at.

104. Indeed, if we take a view of the several phenomena, and compare them together, we may observe some likeness and conformity between them. For example, in the falling of a stone to the ground, in the rising of the sea towards the moon, in cohesion, crystallization, etc, there is something alike, namely, an union or mutual approach of bodies. So that any one of these or the like phenomena may not seem strange or surprising to a man who has nicely observed and

compared the effects of nature. For that only is thought so which is uncommon, or a thing by itself, and out of the ordinary course of our observation. That bodies should tend towards the centre of the earth is not thought strange, because it is what we perceive every moment of our lives. But, that they should have a like gravitation towards the centre of the moon may seem odd and unaccountable to most men, because it is discerned only in the tides. But a philosopher, whose thoughts take in a larger compass of nature, having observed a certain similitude of appearances, as well in the heavens as the earth, that argue innumerable bodies to have a mutual tendency towards each other, which he denotes by the general name "attraction," whatever can be reduced to that he thinks justly accounted for. Thus he explains the tides by the attraction of the terraqueous globe towards the moon, which to him does not appear odd or anomalous, but only a particular example of a general rule or law of nature.

105. If therefore we consider the difference there is betwixt natural philosophers and other men, with regard to their knowledge of the phenomena, we shall find it consists not in an exacter knowledge of the efficient cause that produces them- for that can be no other than the will of a spirit- but only in a greater largeness of comprehension, whereby analogies, harmonies, and agreements are discovered in the works of nature, and the particular effects explained, that is, reduced to general rules, see sect. 62, which rules, grounded on the analogy and uniformness observed in the production of natural effects, are most agreeable and sought after by the mind; for that they extend our prospect beyond what is present and near to us, and enable us to make very probable conjectures touching things that may have happened at very great distances of time and place, as well as to predict things to come; which sort of endeavour towards omniscience is much affected by the mind.

106. But we should proceed warily in such things, for we are apt to lay too great stress on analogies, and, to the prejudice of truth, humour that eagerness of the mind whereby it is carried to extend its knowledge into general theorems. For example, in the business of gravitation or mutual attraction, because it appears in many instances, some are straightway for pronouncing it universal; and that to attract and be attracted by every other body is an essential quality inherent in all bodies whatsoever. Whereas it is evident the fixed stars have no such tendency towards each other; and, so far is that gravitation from being essential to bodies that in some instances a quite contrary principle seems to shew itself; as in the perpendicular growth of plants, and the elasticity of the air. There is nothing necessary or essential in the case, but it depends entirely on the will of the Governing Spirit, who causes certain bodies to cleave together or tend towards each other according to various laws, whilst He keeps others at a fixed distance; and to some He gives a quite contrary tendency to fly asunder just as He sees convenient.

107. After what has been premised, I think we may lay down the following conclusions. First, it is plain philosophers amuse themselves in vain, when they inquire for any natural efficient cause, distinct from a mind or spirit. Secondly, considering the whole creation is the workmanship of a wise and good Agent, it should seem to become philosophers to employ their thoughts (contrary to what some hold) about the final causes of things; and I confess I see no reason why pointing out the various ends to which natural things are adapted, and for which they were originally with unspeakable wisdom contrived, should not be thought one good way of accounting for them, and altogether worthy a philosopher. Thirdly, from what has been premised no reason can be drawn why the history of nature should not still be studied, and observations and experiments made, which, that they are of use to mankind, and enable us to draw any general conclusions, is not the result of any immutable habitudes or relations between things themselves, but only of God's

goodness and kindness to men in the administration of the world. See sect. 30 and 31 Fourthly, by a diligent observation of the phenomena within our view, we may discover the general laws of nature, and from them deduce the other phenomena; I do not say demonstrate, for all deductions of that kind depend on a supposition that the Author of nature always operates uniformly, and in a constant observance of those rules we take for principles: which we cannot evidently know.

108. Those men who frame general rules from the phenomena and afterwards derive the phenomena from those rules, seem to consider signs rather than causes. A man may well understand natural signs without knowing their analogy, or being able to say by what rule a thing is so or so. And, as it is very possible to write improperly, through too strict an observance of general grammar rules; so, in arguing from general laws of nature, it is not impossible we may extend the analogy too far, and by that means run into mistakes.

109. As in reading other books a wise man will choose to fix his thoughts on the sense and apply it to use, rather than lay them out in grammatical remarks on the language; so, in perusing the volume of nature, it seems beneath the dignity of the mind to affect an exactness in reducing each particular phenomenon to general rules, or shewing how it follows from them. We should propose to ourselves nobler views, namely, to recreate and exalt the mind with a prospect of the beauty, order. extent, and variety of natural things: hence, by proper inferences, to enlarge our notions of the grandeur, wisdom, and beneficence of the Creator; and lastly, to make the several parts of the creation, so far as in us lies, subservient to the ends they were designed for, God's glory, and the sustentation and comfort of ourselves and fellow-creatures.

110. The best key for the aforesaid analogy or natural Science will be easily acknowledged to be a certain celebrated Treatise of Mechanics. In the entrance of which justly admired treatise, Time, Space, and Motion are distinguished into absolute and relative, true and apparent, mathematical and vulgar; which distinction, as it is at large explained by the author, does suppose these quantities to have an existence without the mind; and that they are ordinarily conceived with relation to sensible things, to which nevertheless in their own nature they bear no relation at all.

111. As for Time, as it is there taken in an absolute or abstracted sense, for the duration or perseverance of the existence of things, I have nothing more to add concerning it after what has been already said on that subject. Sect. 97 and 98. For the rest, this celebrated author holds there is an absolute Space, which, being unperceivable to sense, remains in itself similar and immovable; and relative space to be the measure thereof, which, being movable and defined by its situation in respect of sensible bodies, is vulgarly taken for immovable space. Place he defines to be that part of space which is occupied by any body; and according as the space is absolute or relative so also is the place. Absolute Motion is said to be the translation of a body from absolute place to absolute place, as relative motion is from one relative place to another. And, because the parts of absolute space do not fall under our senses, instead of them we are obliged to use their sensible measures, and so define both place and motion with respect to bodies which we regard as immovable. But, it is said in philosophical matters we must abstract from our senses, since it may be that none of those bodies which seem to be quiescent are truly so, and the same thing which is moved relatively may be really at rest; as likewise one and the same body may be in relative rest and motion, or even moved with contrary relative motions at the same time, according as its place is variously defined. All which ambiguity is to be found in the apparent motions, but not at all in the true or absolute, which should therefore be alone regarded in philosophy. And the true as we are told are distinguished from apparent or relative motions by the following properties.- First, in true or absolute motion all parts which preserve the same position with respect of the whole, partake of

the motions of the whole. Secondly, the place being moved, that which is placed therein is also moved; so that a body moving in a place which is in motion doth participate the motion of its place. Thirdly, true motion is never generated or changed otherwise than by force impressed on the body itself. Fourthly, true motion is always changed by force impressed on the body moved. Fifthly, in circular motion barely relative there is no centrifugal force, which, nevertheless, in that which is true or absolute, is proportional to the quantity of motion.

112. But, notwithstanding what has been said, I must confess it does not appear to me that there can be any motion other than relative; so that to conceive motion there must be at least conceived two bodies, whereof the distance or position in regard to each other is varied. Hence, if there was one only body in being it could not possibly be moved. This seems evident, in that the idea I have of motion doth necessarily include relation.

113. But, though in every motion it be necessary to conceive more bodies than one, yet it may be that one only is moved, namely, that on which the force causing the change in the distance or situation of the bodies, is impressed. For, however some may define relative motion, so as to term that body moved which changes its distance from some other body, whether the force or action causing that change were impressed on it or no, yet as relative motion is that which is perceived by sense, and regarded in the ordinary affairs of life, it should seem that every man of common sense knows what it is as well as the best philosopher. Now, I ask any one whether, in his sense of motion as he walks along the streets, the stones he passes over may be said to move, because they change distance with his feet? To me it appears that though motion includes a relation of one thing to another, yet it is not necessary that each term of the relation be denominated from it. As a man may think of somewhat which does not think, so a body may be moved to or from another body which is not therefore itself in motion.

114. As the place happens to be variously defined, the motion which is related to it varies. A man in a ship may be said to be quiescent with relation to the sides of the vessel, and yet move with relation to the land. Or he may move eastward in respect of the one, and westward in respect of the other. In the common affairs of life men never go beyond the earth to define the place of any body; and what is quiescent in respect of that is accounted absolutely to be so. But philosophers, who have a greater extent of thought, and juster notions of the system of things, discover even the earth itself to be moved. In order therefore to fix their notions they seem to conceive the corporeal world as finite, and the utmost unmoved walls or shell thereof to be the place whereby they estimate true motions. If we sound our own conceptions, I believe we may find all the absolute motion we can frame an idea of to be at bottom no other than relative motion thus defined. For, as hath been already observed, absolute motion, exclusive of all external relation, is incomprehensible; and to this kind of relative motion all the above-mentioned properties, causes, and effects ascribed to absolute motion will, if I mistake not, be found to agree. As to what is said of the centrifugal force, that it does not at all belong to circular relative motion, I do not see how this follows from the experiment which is brought to prove it. See Philosophiae Naturalis Principia Mathematica, in Schol. Def. VIII. For the water in the vessel at that time wherein it is said to have the greatest relative circular motion, hath, I think, no motion at all; as is plain from the foregoing section.

115. For, to denominate a body moved it is requisite, first, that it change its distance or situation with regard to some other body; and secondly, that the force occasioning that change be applied to it. If either of these be wanting, I do not think that, agreeably to the sense of mankind, or the propriety of language, a body can be said to be in motion. I grant indeed that it is possible for us to think a body which we see change its distance from some other to be moved, though it have no

force applied to it (in which sense there may be apparent motion), but then it is because the force causing the change of distance is imagined by us to be applied or impressed on that body thought to move; which indeed shews we are capable of mistaking a thing to be in motion which is not, and that is all.

116. From what has been said it follows that the philosophic consideration of motion does not imply the being of an absolute Space, distinct from that which is perceived by sense and related bodies; which that it cannot exist without the mind is clear upon the same principles that demonstrate the like of all other objects of sense. And perhaps, if we inquire narrowly, we shall find we cannot even frame an idea of pure Space exclusive of all body. This I must confess seems impossible, as being a most abstract idea. When I excite a motion in some part of my body, if it be free or without resistance, I say there is Space; but if I find a resistance, then I say there is Body; and in proportion as the resistance to motion is lesser or greater, I say the space is more or less pure. So that when I speak of pure or empty space, it is not to be supposed that the word "space" stands for an idea distinct from or conceivable without body and motion- though indeed we are apt to think every noun substantive stands for a distinct idea that may be separated from all others; which has occasioned infinite mistakes. When, therefore, supposing all the world to be annihilated besides my own body, I say there still remains pure Space, thereby nothing else is meant but only that I conceive it possible for the limbs of my body to be moved on all sides without the least resistance, but if that, too, were annihilated then there could be no motion, and consequently no Space. Some, perhaps, may think the sense of seeing doth furnish them with the idea of pure space; but it is plain from what we have elsewhere shewn, that the ideas of space and distance are not obtained by that sense. See the Essay concerning Vision.

117. What is here laid down seems to put an end to all those disputes and difficulties that have sprung up amongst the learned concerning the nature of pure Space. But the chief advantage arising from it is that we are freed from that dangerous dilemma, to which several who have employed their thoughts on that subject imagine themselves reduced, to wit, of thinking either that Real Space is God, or else that there is something beside God which is eternal, uncreated, infinite, indivisible, immutable. Both which may justly be thought pernicious and absurd notions. It is certain that not a few divines, as well as philosophers of great note, have, from the difficulty they found in conceiving either limits or annihilation of space, concluded it must be divine. And some of late have set themselves particularly to shew the incommunicable attributes of God agree to it. Which doctrine, how unworthy soever it may seem of the Divine Nature, yet I do not see how we can get clear of it, so long as we adhere to the received opinions.

118. Hitherto of Natural Philosophy: we come now to make some inquiry concerning that other great branch of speculative knowledge, to wit, Mathematics. These, how celebrated soever they may be for their clearness and certainty of demonstration, which is hardly anywhere else to be found, cannot nevertheless be supposed altogether free from mistakes, if in their principles there lurks some secret error which is common to the professors of those sciences with the rest of mankind. Mathematicians, though they deduce their theorems from a great height of evidence, yet their first principles are limited by the consideration of quantity: and they do not ascend into any inquiry concerning those transcendental maxims which influence all the particular sciences, each part whereof, Mathematics not excepted, does consequently participate of the errors involved in them. That the principles laid down by mathematicians are true, and their way of deduction from those principles clear and incontestible, we do not deny; but, we hold there may be certain erroneous maxims of greater extent than the object of Mathematics, and for that reason not

expressly mentioned, though tacitly supposed throughout the whole progress of that science; and that the ill effects of those secret unexamined errors are diffused through all the branches thereof. To be plain, we suspect the mathematicians are as well as other men concerned in the errors arising from the doctrine of abstract general ideas, and the existence of objects without the mind.

119. Arithmetic has been thought to have for its object abstract ideas of Number; of which to understand the properties and mutual habitudes, is supposed no mean part of speculative knowledge. The opinion of the pure and intellectual nature of numbers in abstract has made them in esteem with those philosophers who seem to have affected an uncommon fineness and elevation of thought. It hath set a price on the most trifling numerical speculations which in practice are of no use, but serve only for amusement; and hath therefore so far infected the minds of some, that they have dreamed of mighty mysteries involved in numbers, and attempted the explication of natural things by them. But, if we inquire into our own thoughts, and consider what has been premised, we may perhaps entertain a low opinion of those high flights and abstractions, and look on all inquiries, about numbers only as so many difficiles nugae, so far as they are not subservient to practice, and promote the benefit of life.

120. Unity in abstract we have before considered in sect. 13, from which and what has been said in the Introduction, it plainly follows there is not any such idea. But, number being defined a "collection of units," we may conclude that, if there be no such thing as unity or unit in abstract, there are no ideas of number in abstract denoted by the numeral names and figures. The theories therefore in Arithmetic. if they are abstracted from the names and figures, as likewise from all use and practice, as well as from the particular things numbered, can be supposed to have nothing at all for their object; hence we may see how entirely the science of numbers is subordinate to practice, and how jejune and trifling it becomes when considered as a matter of mere speculation.

121. However, since there may be some who, deluded by the specious show of discovering abstracted verities, waste their time in arithmetical theorems and problems which have not any use, it will not be amiss if we more fully consider and expose the vanity of that pretence; and this will plainly appear by taking a view of Arithmetic in its infancy, and observing what it was that originally put men on the study of that science, and to what scope they directed it. It is natural to think that at first, men, for ease of memory and help of computation, made use of counters, or in writing of single strokes, points, or the like, each whereof was made to signify an unit, i.e., some one thing of whatever kind they had occasion to reckon. Afterwards they found out the more compendious ways of making one character stand in place of several strokes or points. And, lastly, the notation of the Arabians or Indians came into use, wherein, by the repetition of a few characters or figures, and varying the signification of each figure according to the place it obtains, all numbers may be most aptly expressed; which seems to have been done in imitation of language, so that an exact analogy is observed betwixt the notation by figures and names, the nine simple figures answering the nine first numeral names and places in the former, corresponding to denominations in the latter. And agreeably to those conditions of the simple and local value of figures, were contrived methods of finding, from the given figures or marks of the parts, what figures and how placed are proper to denote the whole, or vice versa. And having found the sought figures, the same rule or analogy being observed throughout, it is easy to read them into words; and so the number becomes perfectly known. For then the number of any particular things is said to be known, when we know the name of figures (with their due arrangement) that according to the standing analogy belong to them. For, these signs being known, we can by the operations of arithmetic know the signs of any part of the particular sums signified by them; and, thus

computing in signs (because of the connexion established betwixt them and the distinct multitudes of things whereof one is taken for an unit), we may be able rightly to sum up, divide, and proportion the things themselves that we intend to number.

122. In Arithmetic, therefore, we regard not the things, but the signs, which nevertheless are not regarded for their own sake, but because they direct us how to act with relation to things, and dispose rightly of them. Now, agreeably to what we have before observed of words in general (sect. 19, Introd.) it happens here likewise that abstract ideas are thought to be signified by numeral names or characters, while they do not suggest ideas of particular things to our minds. I shall not at present enter into a more particular dissertation on this subject, but only observe that it is evident from what has been said, those things which pass for abstract truths and theorems concerning numbers, are in reality conversant about no object distinct from particular numeral things, except only names and characters, which originally came to be considered on no other account but their being signs, or capable to represent aptly whatever particular things men had need to compute. Whence it follows that to study them for their own sake would be just as wise, and to as good purpose as if a man, neglecting the true use or original intention and subserviency of language, should spend his time in impertinent criticisms upon words, or reasonings and controversies purely verbal.

123. From numbers we proceed to speak of Extension, which, considered as relative, is the object of Geometry. The infinite divisibility of finite extension, though it is not expressly laid down either as an axiom or theorem in the elements of that science, yet is throughout the same everywhere supposed and thought to have so inseparable and essential a connexion with the principles and demonstrations in Geometry, that mathematicians never admit it into doubt, or make the least question of it. And, as this notion is the source from whence do spring all those amusing geometrical paradoxes which have such a direct repugnancy to the plain common sense of mankind, and are admitted with so much reluctance into a mind not yet debauched by learning; so it is the principal occasion of all that nice and extreme subtilty which renders the study of Mathematics so difficult and tedious. Hence, if we can make it appear that no finite extension contains innumerable parts, or is infinitely divisible, it follows that we shall at once clear the science of Geometry from a great number of difficulties and contradictions which have ever been esteemed a reproach to human reason, and withal make the attainment thereof a business of much less time and pains than it hitherto has been.

124. Every particular finite extension which may possibly be the object of our thought is an idea existing only in the mind, and consequently each part thereof must be perceived. If, therefore, I cannot perceive innumerable parts in any finite extension that I consider, it is certain they are not contained in it; but, it is evident that I cannot distinguish innumerable parts in any particular line, surface, or solid, which I either perceive by sense, or figure to myself in my mind: wherefore I conclude they are not contained in it. Nothing can be plainer to me than that the extensions I have in view are no other than my own ideas; and it is no less plain that I cannot resolve any one of my ideas into an infinite number of other ideas, that is, that they are not infinitely divisible. If by finite extension be meant something distinct from a finite idea, I declare I do not know what that is, and so cannot affirm or deny anything of it. But if the terms "extension," "parts," &c., are taken in any sense conceivable, that is, for ideas, then to say a finite quantity or extension consists of parts infinite in number is so manifest a contradiction, that every one at first sight acknowledges it to be so; and it is impossible it should ever gain the assent of any reasonable creature who is not brought to it by gentle and slow degrees, as a converted Gentile to the belief of transubstantiation. Ancient

and rooted prejudices do often pass into principles; and those propositions which once obtain the force and credit of a principle, are not only themselves, but likewise whatever is deducible from them, thought privileged from all examination. And there is no absurdity so gross, which, by this means, the mind of man may not be prepared to swallow.

125. He whose understanding is possessed with the doctrine of abstract general ideas may be persuaded that (whatever be thought of the ideas of sense) extension in abstract is infinitely divisible. And one who thinks the objects of sense exist without the mind will perhaps in virtue thereof be brought to admit that a line but an inch long may contain innumerable parts- really existing, though too small to be discerned. These errors are grafted as well in the minds of geometricians as of other men, and have a like influence on their reasonings; and it were no difficult thing to shew how the arguments from Geometry made use of to support the infinite divisibility of extension are bottomed on them. At present we shall only observe in general whence it is the mathematicians are all so fond and tenacious of that doctrine.

126. It hath been observed in another place that the theorems and demonstrations in Geometry are conversant about universal ideas (sect. 15, Introd.); where it is explained in what sense this ought to be understood, to wit, the particular lines and figures included in the diagram are supposed to stand for innumerable others of different sizes; or, in other words, the geometer considers them abstracting from their magnitude- which does not imply that he forms an abstract idea, but only that he cares not what the particular magnitude is, whether great or small, but looks on that as a thing different to the demonstration. Hence it follows that a line in the scheme but an inch long must be spoken of as though it contained ten thousand parts, since it is regarded not in itself, but as it is universal; and it is universal only in its signification, whereby it represents innumerable lines greater than itself, in which may be distinguished ten thousand parts or more, though there may not be above an inch in it. After this manner, the properties of the lines signified are (by a very usual figure) transferred to the sign, and thence, through mistake, though to appertain to it considered in its own nature.

127. Because there is no number of parts so great but it is possible there may be a line containing more, the inch-line is said to contain parts more than any assignable number; which is true, not of the inch taken absolutely, but only for the things signified by it. But men, not retaining that distinction in their thoughts, slide into a belief that the small particular line described on paper contains in itself parts innumerable. There is no such thing as the ten-thousandth part of an inch; but there is of a mile or diameter of the earth, which may be signified by that inch. When therefore I delineate a triangle on paper, and take one side not above an inch, for example, in length to be the radius, this I consider as divided into 10,000 or 100,000 parts or more; for, though the ten-thousandth part of that line considered in itself is nothing at all, and consequently may be neglected without an error or inconveniency, yet these described lines, being only marks standing for greater quantities, whereof it may be the ten-thousandth part is very considerable, it follows that, to prevent notable errors in practice, the radius must be taken of 10,000 parts or more.

128. From what has been said the reason is plain why, to the end any theorem become universal in its use, it is necessary we speak of the lines described on paper as though they contained parts which really they do not. In doing of which, if we examine the matter thoroughly, we shall perhaps discover that we cannot conceive an inch itself as consisting of, or being divisible into, a thousand parts, but only some other line which is far greater than an inch, and represented by it; and that when we say a line is infinitely divisible, we must mean a line which is infinitely great. What we have here observed seems to be the chief cause why, to suppose the infinite divisibility of finite

extension has been thought necessary in geometry.

129. The several absurdities and contradictions which flowed from this false principle might, one would think, have been esteemed so many demonstrations against it. But, by I know not what logic, it is held that proofs a posteriori are not to be admitted against propositions relating to infinity, as though it were not impossible even for an infinite mind to reconcile contradictions; or as if anything absurd and repugnant could have a necessary connexion with truth or flow from it. But, whoever considers the weakness of this pretence will think it was contrived on purpose to humour the laziness of the mind which had rather acquiesce in an indolent scepticism than be at the pains to go through with a severe examination of those principles it has ever embraced for true.

130. Of late the speculations about Infinities have run so high, and grown to such strange notions, as have occasioned no small scruples and disputes among the geometers of the present age. Some there are of great note who, not content with holding that finite lines may be divided into an infinite number of parts, do yet farther maintain that each of those infinitesimals is itself subdivisible into an infinity of other parts or infinitesimals of a second order, and so on ad infinitum. These, I say, assert there are infinitesimals of infinitesimals of infinitesimals, &c., without ever coming to an end; so that according to them an inch does not barely contain an infinite number of parts, but an infinity of an infinity of an infinity ad infinitum of parts. Others there be who hold all orders of infinitesimals below the first to be nothing at all; thinking it with good reason absurd to imagine there is any positive quantity or part of extension which, though multiplied infinitely, can never equal the smallest given extension. And yet on the other hand it seems no less absurd to think the square, cube or other power of a positive real root, should itself be nothing at all; which they who hold infinitesimals of the first order, denying all of the subsequent orders, are obliged to maintain.

131. Have we not therefore reason to conclude they are both in the wrong, and that there is in effect no such thing as parts infinitely small, or an infinite number of parts contained in any finite quantity? But you will say that if this doctrine obtains it will follow the very foundations of Geometry are destroyed, and those great men who have raised that science to so astonishing a height, have been all the while building a castle in the air. To this it may be replied that whatever is useful in geometry, and promotes the benefit of human life, does still remain firm and unshaken on our principles; that science considered as practical will rather receive advantage than any prejudice from what has been said. But to set this in a due light may be the proper business of another place. For the rest, though it should follow that some of the more intricate and subtle parts of Speculative Mathematics may be pared off without any prejudice to truth, yet I do not see what damage will be thence derived to mankind. On the contrary, I think it were highly to be wished that men of great abilities and obstinate application would draw off their thoughts from those amusements, and employ them in the study of such things as lie nearer the concerns of life, or have a more direct influence on the manners.

132. It is be said that several theorems undoubtedly true are discovered by methods in which infinitesimals are made use of, which could never have been if their existence included a contradiction in it; I answer that upon a thorough examination it will not be found that in any instance it is necessary to make use of or conceive infinitesimal parts of finite lines, or even quantities less than the minimum sensible; nay, it will be evident this is never done, it being impossible.

133. By what we have premised, it is plain that very numerous and important errors have taken

their rise from those false Principles which were impugned in the foregoing parts of this treatise; and the opposites of those erroneous tenets at the same time appear to be most fruitful Principles, from whence do flow innumerable consequences highly advantageous to true philosophy. as well as to religion. Particularly Matter, or the absolute existence of corporeal objects, hath been shewn to be that wherein the most avowed and pernicious enemies of all knowledge, whether human or divine, have ever placed their chief strength and confidence. And surely, if by distinguishing the real existence of unthinking things from their being perceived, and allowing them a subsistance of their own out of the minds of spirits, no one thing is explained in nature, but on the contrary a great many inexplicable difficulties arise; if the supposition of Matter is barely precarious, as not being grounded on so much as one single reason; if its consequences cannot endure the light of examination and free inquiry, but screen themselves under the dark and general pretence of "infinites being incomprehensible"; if withal the removal of this Matter be not attended with the least evil consequence; if it be not even missed in the world, but everything as well, nay much easier conceived without it; if, lastly, both Sceptics and Atheists are for ever silenced upon supposing only spirits and ideas, and this scheme of things is perfectly agreeable both to Reason and Religion: methinks we may expect it should be admitted and firmly embraced, though it were proposed only as an hypothesis, and the existence of Matter had been allowed possible, which yet I think we have evidently demonstrated that it is not.

134. True it is that, in consequence of the foregoing principles, several disputes and speculations which are esteemed no mean parts of learning, are rejected as useless. But, how great a prejudice soever against our notions this may give to those who have already been deeply engaged, and make large advances in studies of that nature, yet by others we hope it will not be thought any just ground of dislike to the principles and tenets herein laid down, that they abridge the labour of study, and make human sciences far more clear, compendious and attainable than they were before.

135. Having despatched what we intended to say concerning the knowledge of IDEAS, the method we proposed leads us in the next place to treat of SPIRITS- with regard to which, perhaps, human knowledge is not so deficient as is vulgarly imagined. The great reason that is assigned for our being thought ignorant of the nature of spirits is our not having an idea of it. But, surely it ought not to be looked on as a defect in a human understanding that it does not perceive the idea of spirit, if it is manifestly impossible there should be any such idea. And this if I mistake not has been demonstrated in section 27; to which I shall here add that a spirit has been shewn to be the only substance or support wherein unthinking beings or ideas can exist; but that this substance which supports or perceives ideas should itself be an idea or like an idea is evidently absurd.

136. It will perhaps be said that we want a sense (as some have imagined) proper to know substances withal, which, if we had, we might know our own soul as we do a triangle. To this I answer, that, in case we had a new sense bestowed upon us, we could only receive thereby some new sensations or ideas of sense. But I believe nobody will say that what he means by the terms soul and substance is only some particular sort of idea or sensation. We may therefore infer that, all things duly considered, it is not more reasonable to think our faculties defective, in that they do not furnish us with an idea of spirit or active thinking substance, than it would be if we should blame them for not being able to comprehend a round square.

137. From the opinion that spirits are to be known after the manner of an idea or sensation have risen many absurd and heterodox tenets, and much scepticism about the nature of the soul. It is even probable that this opinion may have produced a doubt in some whether they had any soul at

all distinct from their body since upon inquiry they could not find they had an idea of it. That an idea which is inactive, and the existence whereof consists in being perceived, should be the image or likeness of an agent subsisting by itself, seems to need no other refutation than barely attending to what is meant by those words. But, perhaps you will say that though an idea cannot resemble a spirit in its thinking, acting, or subsisting by itself, yet it may in some other respects; and it is not necessary that an idea or image be in all respects like the original.

138. I answer, if it does not in those mentioned, it is impossible it should represent it in any other thing. Do but leave out the power of willing, thinking, and perceiving ideas, and there remains nothing else wherein the idea can be like a spirit. For, by the word spirit we mean only that which thinks, wills, and perceives; this, and this alone, constitutes the signification of the term. If therefore it is impossible that any degree of those powers should be represented in an idea, it is evident there can be no idea of a spirit.

139. But it will be objected that, if there is no idea signified by the terms soul, spirit, and substance, they are wholly insignificant, or have no meaning in them. I answer, those words do mean or signify a real thing, which is neither an idea nor like an idea, but that which perceives ideas, and wills, and reasons about them. What I am myself, that which I denote by the term I, is the same with what is meant by soul or spiritual substance. If it be said that this is only quarreling at a word, and that, since the immediately significations of other names are by common consent called ideas, no reason can be assigned why that which is signified by the name spirit or soul may not partake in the same appellation. I answer, all the unthinking objects of the mind agree in that they are entirely passive, and their existence consists only in being perceived; whereas a soul or spirit is an active being, whose existence consists, not in being perceived, but in perceiving ideas and thinking. It is therefore necessary, in order to prevent equivocation and confounding natures perfectly disagreeing and unlike, that we distinguish between spirit and idea. See sect. 27.

140. In a large sense, indeed, we may be said to have an idea or rather a notion of spirit; that is, we understand the meaning of the word, otherwise we could not affirm or deny anything of it. Moreover, as we conceive the ideas that are in the minds of other spirits by means of our own, which we suppose to be resemblances of them; so we know other spirits by means of our own soul- which in that sense is the image or idea of them; it having a like respect to other spirits that blueness or heat by me perceived has to those ideas perceived by another.

141. It must not be supposed that they who assert the natural immortality of the soul are of opinion that it is absolutely incapable of annihilation even by the infinite power of the Creator who first gave it being, but only that it is not liable to be broken or dissolved by the ordinary laws of nature or motion. They indeed who hold the soul of man to be only a thin vital flame, or system of animal spirits, make it perishing and corruptible as the body; since there is nothing more easily dissipated than such a being, which it is naturally impossible should survive the ruin of the tabernacle wherein it is enclosed. And this notion has been greedily embraced and cherished by the worst part of mankind, as the most effectual antidote against all impressions of virtue and religion. But it has been made evident that bodies, of what frame or texture soever, are barely passive ideas in the mind, which is more distant and heterogeneous from them than light is from darkness. We have shewn that the soul is indivisible, incorporeal, unextended, and it is consequently incorruptible. Nothing can be plainer than that the motions, changes, decays, and dissolutions which we hourly see befall natural bodies (and which is what we mean by the course of nature) cannot possibly affect an active, simple, uncompounded substance; such a being therefore is indissoluble by the force of nature; that is to say, "the soul of man is naturally immortal."

142. After what has been said, it is, I suppose, plain that our souls are not to be known in the same manner as senseless, inactive objects, or by way of idea. Spirits and ideas are things so wholly different, that when we say "they exist," "they are known," or the like, these words must not be thought to signify anything common to both natures. There is nothing alike or common in them: and to expect that by any multiplication or enlargement of our faculties we may be enabled to know a spirit as we do a triangle, seems as absurd as if we should hope to see a sound. This is inculcated because I imagine it may be of moment towards clearing several important questions, and preventing some very dangerous errors concerning the nature of the soul. We may not, I think, strictly be said to have an idea of an active being, or of an action, although we may be said to have a notion of them. I have some knowledge or notion of my mind, and its acts about ideas, inasmuch as I know or understand what is meant by these words. What I know, that I have some notion of. I will not say that the terms idea and notion may not be used convertibly, if the world will have it so; but yet it conduceth to clearness and propriety that we distinguish things very different by different names. It is also to be remarked that, all relations including an act of the mind, we cannot so properly be said to have an idea, but rather a notion of the relations and habitudes between things. But if, in the modern way, the word idea is extended to spirits, and relations, and acts, this is, after all, an affair of verbal concern.

143. It will not be amiss to add, that the doctrine of abstract ideas has had no small share in rendering those sciences intricate and obscure which are particularly conversant about spiritual things. Men have imagined they could frame abstract notions of the powers and acts of the mind, and consider them prescinded as well from the mind or spirit itself, as from their respective objects and effects. Hence a great number of dark and ambiguous terms, presumed to stand for abstract notions, have been introduced into metaphysics and morality, and from these have grown infinite distractions and disputes amongst the learned.

144. But, nothing seems more to have contributed towards engaging men in controversies and mistakes with regard to the nature and operations of the mind, than the being used to speak of those things in terms borrowed from sensible ideas. For example, the will is termed the motion of the soul; this infuses a belief that the mind of man is as a ball in motion, impelled and determined by the objects of sense, as necessarily as that is by the stroke of a racket. Hence arise endless scruples and errors of dangerous consequence in morality. All which, I doubt not, may be cleared, and truth appear plain, uniform, and consistent, could but philosophers be prevailed on to retire into themselves, and attentively consider their own meaning.

145. From what has been said, it is plain that we cannot know the existence of other spirits otherwise than by their operations, or the ideas by them excited in us. I perceive several motions, changes, and combinations of ideas, that inform me there are certain particular agents, like myself, which accompany them and concur in their production. Hence, the knowledge I have of other spirits is not immediate, as is the knowledge of my ideas; but depending on the intervention of ideas, by me referred to agents or spirits distinct from myself, as effects or concomitant signs.

146. But, though there be some things which convince us human agents are concerned in producing them; yet it is evident to every one that those things which are called the Works of Nature, that is, the far greater part of the ideas or sensations perceived by us, are not produced by, or dependent on, the wills of men. There is therefore some other Spirit that causes them; since it is repugnant that they should subsist by themselves. See sect. 29. But, if we attentively consider the constant regularity, order, and concatenation of natural things, the surprising magnificence, beauty, and perfection of the larger, and the exquisite contrivance of the smaller parts of creation, together

with the exact harmony and correspondence of the whole, but above all the never-enough-admired laws of pain and pleasure, and the instincts or natural inclinations, appetites, and passions of animals; I say if we consider all these things, and at the same time attend to the meaning and import of the attributes One, Eternal, Infinitely Wise, Good, and Perfect, we shall clearly perceive that they belong to the aforesaid Spirit, "who works all in all," and "by whom all things consist."

147. Hence, it is evident that God is known as certainly and immediately as any other mind or spirit whatsoever distinct from ourselves. We may even assert that the existence of God is far more evidently perceived than the existence of men; because the effects of nature are infinitely more numerous and considerable than those ascribed to human agents. There is not any one mark that denotes a man, or effect produced by him, which does not more strongly evince the being of that Spirit who is the Author of Nature. For, it is evident that in affecting other persons the will of man has no other object than barely the motion of the limbs of his body; but that such a motion should be attended by, or excite any idea in the mind of another, depends wholly on the will of the Creator. He alone it is who, "upholding all things by the word of His power," maintains that intercourse between spirits whereby they are able to perceive the existence of each other. And yet this pure and clear light which enlightens every one is itself invisible.

148. It seems to be a general pretence of the unthinking herd that they cannot see God. Could we but see Him, say they, as we see a man, we should believe that He is, and believing obey His commands. But alas, we need only open our eyes to see the Sovereign Lord of all things, with a more full and clear view than we do any one of our fellow-creatures. Not that I imagine we see God (as some will have it) by a direct and immediate view; or see corporeal things, not by themselves, but by seeing that which represents them in the essence of God, which doctrine is, I must confess, to me incomprehensible. But I shall explain my meaning;- A human spirit or person is not perceived by sense, as not being an idea; when therefore we see the colour, size, figure, and motions of a man, we perceive only certain sensations or ideas excited in our own minds; and these being exhibited to our view in sundry distinct collections, serve to mark out unto us the existence of finite and created spirits like ourselves. Hence it is plain we do not see a man- if by man is meant that which lives, moves, perceives, and thinks as we do- but only such a certain collection of ideas as directs us to think there is a distinct principle of thought and motion, like to ourselves, accompanying and represented by it. And after the same manner we see God; all the difference is that, whereas some one finite and narrow assemblage of ideas denotes a particular human mind, whithersoever we direct our view, we do at all times and in all places perceive manifest tokens of the Divinity: everything we see, hear, feel, or anywise perceive by sense, being a sign or effect of the power of God; as is our perception of those very motions which are produced by men.

149. It is therefore plain that nothing can be more evident to any one that is capable of the least reflexion than the existence of God, or a Spirit who is intimately present to our minds, producing in them all that variety of ideas or sensations which continually affect us, on whom we have an absolute and entire dependence, in short "in whom we live, and move, and have our being." That the discovery of this great truth, which lies so near and obvious to the mind, should be attained to by the reason of so very few, is a sad instance of the stupidity and inattention of men, who, though they are surrounded with such clear manifestations of the Deity, are yet so little affected by them that they seem, as it were, blinded with excess of light.

150. But you will say, Hath Nature no share in the production of natural things, and must they be all ascribed to the immediate and sole operation of God? I answer, if by Nature is meant only the visible series of effects or sensations imprinted on our minds, according to certain fixed and

general laws, then it is plain that Nature, taken in this sense, cannot produce anything at all. But, if by Nature is meant some being distinct from God, as well as from the laws of nature, and things perceived by sense, I must confess that word is to me an empty sound without any intelligible meaning annexed to it. Nature, in this acceptation, is a vain chimera, introduced by those heathens who had not just notions of the omnipresence and infinite perfection of God. But, it is more unaccountable that it should be received among Christians, professing belief in the Holy Scriptures, which constantly ascribe those effects to the immediate hand of God that heathen philosophers are wont to impute to Nature. "The Lord He causeth the vapours to ascend; He maketh lightnings with rain; He bringeth forth the wind out of his treasures." Jerem. 10. 13. "He turneth the shadow of death into the morning, and maketh the day dark with night." Amos, 5. 8. "He visiteth the earth, and maketh it soft with showers: He blesseth the springing thereof, and crowneth the year with His goodness; so that the pastures are clothed with flocks, and the valleys are covered over with corn." See Psalm 65. But, notwithstanding that this is the constant language of Scripture, yet we have I know not what aversion from believing that God concerns Himself so nearly in our affairs. Fain would we suppose Him at a great distance off, and substitute some blind unthinking deputy in His stead, though (if we may believe Saint Paul) "He be not far from every one of us."

151. It will, I doubt not, be objected that the slow and gradual methods observed in the production of natural things do not seem to have for their cause the immediate hand of an Almighty Agent. Besides, monsters, untimely births, fruits blasted in the blossom, rains falling in desert places, miseries incident to human life, and the like, are so many arguments that the whole frame of nature is not immediately actuated and superintended by a Spirit of infinite wisdom and goodness. But the answer to this objection is in a good measure plain from sect. 62; it being visible that the aforesaid methods of nature are absolutely necessary, in order to working by the most simple and general rules, and after a steady and consistent manner; which argues both the wisdom and goodness of God. Such is the artificial contrivance of this mighty machine of nature that, whilst its motions and various phenomena strike on our senses, the hand which actuates the whole is itself unperceivable to men of flesh and blood. "Verily" (saith the prophet) "thou art a God that hidest thyself." Isaiah, 45. 15. But, though the Lord conceal Himself from the eyes of the sensual and lazy, who will not be at the least expense of thought, yet to an unbiased and attentive mind nothing can be more plainly legible than the intimate presence of an All-wise Spirit, who fashions, regulates and sustains the whole system of beings. It is clear, from what we have elsewhere observed, that the operating according to general and stated laws is so necessary for our guidance in the affairs of life, and letting us into the secret of nature, that without it all reach and compass of thought, all human sagacity and design, could serve to no manner of purpose; it were even impossible there should be any such faculties or powers in the mind. See sect. 31. Which one consideration abundantly outbalances whatever particular inconveniences may thence arise.

152. We should further consider that the very blemishes and defects of nature are not without their use, in that they make an agreeable sort of variety, and augment the beauty of the rest of the creation, as shades in a picture serve to set off the brighter and more enlightened parts. We would likewise do well to examine whether our taxing the waste of seeds and embryos, and accidental destruction of plants and animals, before they come to full maturity, as an imprudence in the Author of nature, be not the effect of prejudice contracted by our familiarity with impotent and saving mortals. In man indeed a thrifty management of those things which he cannot procure without much pains and industry may be esteemed wisdom. But, we must not imagine that the

inexplicably fine machine of an animal or vegetable costs the great Creator any more pains or trouble in its production than a pebble does; nothing being more evident than that an Omnipotent Spirit can indifferently produce everything by a mere fiat or act of His will. Hence, it is plain that the splendid profusion of natural things should not be interpreted weakness or prodigality in the agent who produces them, but rather be looked on as an argument of the riches of His power.

153. As for the mixture of pain or uneasiness which is in the world, pursuant to the general laws of nature, and the actions of finite, imperfect spirits, this, in the state we are in at present, is indispensably necessary to our well-being. But our prospects are too narrow. We take, for instance, the idea of some one particular pain into our thoughts, and account it evil; whereas, if we enlarge our view, so as to comprehend the various ends, connexions, and dependencies of things, on what occasions and in what proportions we are affected with pain and pleasure, the nature of human freedom, and the design with which we are put into the world; we shall be forced to acknowledge that those particular things which, considered in themselves, appear to be evil, have the nature of good, when considered as linked with the whole system of beings.

154. From what has been said, it will be manifest to any considering person, that it is merely for want of attention and comprehensiveness of mind that there are any favourers of Atheism or the Manichean Heresy to be found. Little and unreflecting souls may indeed burlesque the works of Providence, the beauty and order whereof they have not capacity, or will not be at the pains, to comprehend; but those who are masters of any justness and extent of thought, and are withal used to reflect, can never sufficiently admire the divine traces of Wisdom and Goodness that shine throughout the Economy of Nature. But what truth is there which shineth so strongly on the mind that by an aversion of thought, a wilful shutting of the eyes, we may not escape seeing it? Is it therefore to be wondered at, if the generality of men, who are ever intent on business or pleasure, and little used to fix or open the eye of their mind, should not have all that conviction and evidence of the Being of God which might be expected in reasonable creatures?

155. We should rather wonder that men can be found so stupid as to neglect, than that neglecting they should be unconvinced of such an evident and momentous truth. And yet it is to be feared that too many of parts and leisure, who live in Christian countries, are, merely through a supine and dreadful negligence, sunk into Atheism. Since it is downright impossible that a soul pierced and enlightened with a thorough sense of the omnipresence, holiness, and justice of that Almighty Spirit should persist in a remorseless violation of His laws. We ought, therefore, earnestly to meditate and dwell on those important points; that so we may attain conviction without all scruple "that the eyes of the Lord are in every place beholding the evil and the good; that He is with us and keepeth us in all places whither we go, and giveth us bread to eat and raiment to put on"; that He is present and conscious to our innermost thoughts; and that we have a most absolute and immediate dependence on Him. A clear view of which great truths cannot choose but fill our hearts with an awful circumspection and holy fear, which is the strongest incentive to Virtue, and the best guard against Vice.

156. For, after all, what deserves the first place in our studies is the consideration of GOD and our DUTY; which to promote, as it was the main drift and design of my labours, so shall I esteem them altogether useless and ineffectual if, by what I have said, I cannot inspire my readers with a pious sense of the Presence of God; and, having shewn the falseness or vanity of those barren speculations which make the chief employment of learned men, the better dispose them to reverence and embrace the salutary truths of the Gospel, which to know and to practice is the highest perfection of human nature.

THE END

The Internet Encyclopedia of Philosophy

A Treatise Concerning the Principles of Human Knowledge

George Berkeley

1710

Editor's Note: This e-text is based on the Virginia Tech Eris project text of Berkeley's Principles. This slightly modified text version and associated HTML files were prepared for the Internet Encyclopedia of Philosophy (jfieser@utm.edu).

* * * *

Dedication

To the Right Honourable Thomas, Earl of Pembroke, &C., Knight of the most Noble Order of the Garter and one of the Lords of Her Majesty's most honourable privy council .

My Lord,

You will perhaps wonder that an obscure person, who has not the honour to be known to your lordship, should presume to address you in this manner. But that a man who has written something with a design to promote Useful Knowledge and Religion in the world should make choice of your lordship for his patron, will not be thought strange by any one that is not altogether unacquainted with the present state of the church and learning, and consequently ignorant how great an ornament and support you are to both. Yet, nothing could have induced me to make you this present of my poor endeavours, were I not encouraged by that candour and native goodness which is so bright a part in your lordship's character. I might add, my lord, that the extraordinary favour and bounty you have been pleased to show towards our Society gave me hopes you would not be unwilling to countenance the studies of one of its members. These considerations determined me to lay this treatise at your lordship's feet, and the rather because I was ambitious to have it known that I am with the truest and most profound respect, on account of that learning and virtue which the world so justly admires in your lordship,

MY LORD,

Your lordship's most humble and most devoted servant,

GEORGE BERKELEY

Preface

WHAT I here make public has, after a long and scrupulous inquiry, seemed to me evidently true and not unuseful to be known- particularly to those who are tainted with Scepticism, or want a demonstration of the existence and immateriality of God, or the natural immortality of the soul. Whether it be so or no I am content the reader should impartially examine; since I do not think myself any farther concerned for the success of what I have written than as it is agreeable to truth. But, to the end this may not suffer, I make it my request that the reader suspend his judgment till he has once at least read the whole through with that degree of attention and thought which the subject-matter

shall seem to deserve. For, as there are some passages that, taken by themselves, are very liable (nor could it be remedied) to gross misinterpretation, and to be charged with most absurd consequences, which, nevertheless, upon an entire perusal will appear not to follow from them; so likewise, though the whole should be read over, yet, if this be done transiently, it is very probable my sense may be mistaken; but to a thinking reader, I flatter myself it will be throughout clear and obvious. As for the characters of novelty and singularity which some of the following notions may seem to bear, it is, I hope, needless to make any apology on that account. He must surely be either very weak, or very little acquainted with the sciences, who shall reject a truth that is capable of demonstration, for no other reason but because it is newly known, and contrary to the prejudices of mankind. Thus much I thought fit to premise, in order to prevent, if possible, the hasty censures of a sort of men who are too apt to condemn an opinion before they rightly comprehend it.

* * * *

Introduction

1. Philosophy being nothing else but the study of wisdom and truth, it may with reason be expected that those who have spent most time and pains in it should enjoy a greater calm and serenity of mind, a greater clearness and evidence of knowledge, and be less disturbed with doubts and difficulties than other men. Yet so it is, we see the illiterate bulk of mankind that walk the high-road of plain common sense, and are governed by the dictates of nature, for the most part easy and undisturbed. To them nothing that is familiar appears unaccountable or difficult to comprehend. They complain not of any want of evidence in their senses, and are out of all danger of becoming Sceptics. But no sooner do we depart from sense and instinct to follow the light of a superior principle, to reason, meditate, and reflect on the nature of things, but a thousand scruples spring up in our minds concerning those things which before we seemed fully to comprehend. Prejudices and errors of sense do from all parts discover themselves to our view; and, endeavouring to correct these by reason, we are insensibly drawn into uncouth paradoxes, difficulties, and inconsistencies, which multiply and grow upon us as we advance in speculation, till at length, having wandered through many intricate mazes, we find ourselves just where we were, or, which is worse, sit down in a forlorn Scepticism.

2. The cause of this is thought to be the obscurity of things, or the natural weakness and imperfection of our understandings. It is said, the faculties we have are few, and those designed by nature for the support and comfort of life, and not to penetrate into the inward essence and constitution of things. Besides, the mind of man being finite, when it treats of things which partake of infinity, it is not to be wondered at if it run into absurdities and contradictions, out of which it is impossible it should ever extricate itself, it being of the nature of infinite not to

be comprehended by that which is finite.

3. But, perhaps, we may be too partial to ourselves in placing the fault originally in our faculties, and not rather in the wrong use we make of them. It is a hard thing to suppose that right deductions from true principles should ever end in consequences which cannot be maintained or made consistent. We should believe that God has dealt more bountifully with the sons of men than to give them a strong desire for that knowledge which he had placed quite out of their reach. This were not agreeable to the wonted indulgent methods of Providence, which, whatever appetites it may have implanted in the creatures, doth usually furnish them with such means as, if rightly made use of, will not fail to satisfy them. Upon the whole, I am inclined to think that the far greater part, if not all, of those difficulties which have hitherto amused philosophers, and blocked up the way to knowledge, are entirely owing to ourselves- that we have first raised a dust and then complain we cannot see.

4. My purpose therefore is, to try if I can discover what those Principles are which have introduced all that doubtfulness and uncertainty, those absurdities and contradictions, into the several sects of philosophy; insomuch that the wisest men have thought our ignorance incurable, conceiving it to arise from the natural dulness and limitation of our faculties. And surely it is a work well deserving our pains to make a strict inquiry concerning the First Principles of Human Knowledge, to sift and examine them on all sides, especially since there may be some grounds to suspect that those lets and difficulties, which stay and embarrass the mind in its search after truth, do not spring from any darkness and intricacy in the objects, or natural defect in the understanding, so much as from false Principles which have been insisted on, and might have been avoided.

5. How difficult and discouraging soever this attempt may seem, when I consider how many great and extraordinary men have gone before me in the like designs, yet I am not without some hopes- upon the consideration that the largest views are not always the clearest, and that he who is short-sighted will be obliged to draw the object nearer, and may, perhaps, by a close and narrow survey, discern that which had escaped far better eyes.

6. In order to prepare the mind of the reader for the easier conceiving what follows, it is proper to premise somewhat, by way of Introduction, concerning the nature and abuse of Language. But the unravelling this matter leads me in some measure to anticipate my design, by taking notice of what seems to have had a chief part in rendering speculation intricate and perplexed, and to have occasioned innumerable errors and difficulties in almost all parts of knowledge. And that is the opinion that the mind hath a power of framing abstract ideas or notions of things. He who is not a perfect stranger to the writings and disputes of philosophers must needs acknowledge that no small part of them are spent about abstract ideas. These are in a more especial manner thought to be the object of those sciences which go by the name of Logic and Metaphysics, and of all

that which passes under the notion of the most abstracted and sublime learning, in all which one shall scarce find any question handled in such a manner as does not suppose their existence in the mind, and that it is well acquainted with them.

7. It is agreed on all hands that the qualities or modes of things do never really exist each of them apart by itself, and separated from all others, but are mixed, as it were, and blended together, several in the same object. But, we are told, the mind being able to consider each quality singly, or abstracted from those other qualities with which it is united, does by that means frame to itself abstract ideas. For example, there is perceived by sight an object extended, coloured, and moved: this mixed or compound idea the mind resolving into its simple, constituent parts, and viewing each by itself, exclusive of the rest, does frame the abstract ideas of extension, colour, and motion. Not that it is possible for colour or motion to exist without extension; but only that the mind can frame to itself by abstraction the idea of colour exclusive of extension, and of motion exclusive of both colour and extension.

8. Again, the mind having observed that in the particular extensions perceived by sense there is something common and alike in all, and some other things peculiar, as this or that figure or magnitude, which distinguish them one from another; it considers apart or singles out by itself that which is common, making thereof a most abstract idea of extension, which is neither line, surface, nor solid, nor has any figure or magnitude, but is an idea entirely prescinded from all these. So likewise the mind, by leaving out of the particular colours perceived by sense that which distinguishes them one from another, and retaining that only which is common to all, makes an idea of colour in abstract which is neither red, nor blue, nor white, nor any other determinate colour. And, in like manner, by considering motion abstractedly not only from the body moved, but likewise from the figure it describes, and all particular directions and velocities, the abstract idea of motion is framed; which equally corresponds to all particular motions whatsoever that may be perceived by sense.

9. And as the mind frames to itself abstract ideas of qualities or modes, so does it, by the same precision or mental separation, attain abstract ideas of the more compounded beings which include several coexistent qualities. For example, the mind having observed that Peter, James, and John resemble each other in certain common agreements of shape and other qualities, leaves out of the complex or compounded idea it has of Peter, James, and any other particular man, that which is peculiar to each, retaining only what is common to all, and so makes an abstract idea wherein all the particulars equally partake-abstracting entirely from and cutting off all those circumstances and differences which might determine it to any particular existence. And after this manner it is said we come by the abstract idea of man, or, if you please, humanity, or human nature; wherein it is true there is included colour, because there is no man but has some colour, but then it can be neither white, nor black, nor any

particular colour, because there is no one particular colour wherein all men partake. So likewise there is included stature, but then it is neither tall stature, nor low stature, nor yet middle stature, but something abstracted from all these. And so of the rest. Moreover, their being a great variety of other creatures that partake in some parts, but not all, of the complex idea of man, the mind, leaving out those parts which are peculiar to men, and retaining those only which are common to all the living creatures, frames the idea of animal, which abstracts not only from all particular men, but also all birds, beasts, fishes, and insects. The constituent parts of the abstract idea of animal are body, life, sense, and spontaneous motion. By body is meant body without any particular shape or figure, there being no one shape or figure common to all animals, without covering, either of hair, or feathers, or scales, &c., nor yet naked: hair, feathers, scales, and nakedness being the distinguishing properties of particular animals, and for that reason left out of the abstract idea. Upon the same account the spontaneous motion must be neither walking, nor flying, nor creeping; it is nevertheless a motion, but what that motion is it is not easy to conceive.

10. Whether others have this wonderful faculty of abstracting their ideas, they best can tell: for myself, I find indeed I have a faculty of imagining, or representing to myself, the ideas of those particular things I have perceived, and of variously compounding and dividing them. I can imagine a man with two heads, or the upper parts of a man joined to the body of a horse. I can consider the hand, the eye, the nose, each by itself abstracted or separated from the rest of the body. But then whatever hand or eye I imagine, it must have some particular shape and colour. Likewise the idea of man that I frame to myself must be either of a white, or a black, or a tawny, a straight, or a crooked, a tall, or a low, or a middle-sized man. I cannot by any effort of thought conceive the abstract idea above described. And it is equally impossible for me to form the abstract idea of motion distinct from the body moving, and which is neither swift nor slow, curvilinear nor rectilinear; and the like may be said of all other abstract general ideas whatsoever. To be plain, I own myself able to abstract in one sense, as when I consider some particular parts or qualities separated from others, with which, though they are united in some object, yet it is possible they may really exist without them. But I deny that I can abstract from one another, or conceive separately, those qualities which it is impossible should exist so separated; or that I can frame a general notion, by abstracting from particulars in the manner aforesaid- which last are the two proper acceptations of abstraction. And there are grounds to think most men will acknowledge themselves to be in my case. The generality of men which are simple and illiterate never pretend to abstract notions. It is said they are difficult and not to be attained without pains and study; we may therefore reasonably conclude that, if such there be, they are confined only to the learned.

11. I proceed to examine what can be alleged in defence of the doctrine of abstraction, and try if I can discover what it is that inclines the men of speculation to

embrace an opinion so remote from common sense as that seems to be. There has been a late deservedly esteemed philosopher who, no doubt, has given it very much countenance, by seeming to think the having abstract general ideas is what puts the widest difference in point of understanding betwixt man and beast. "The having of general ideas," saith he, "is that which puts a perfect distinction betwixt man and brutes, and is an excellency which the faculties of brutes do by no means attain unto. For, it is evident we observe no foot-steps in them of making use of general signs for universal ideas; from which we have reason to imagine that they have not the faculty of abstracting, or making general ideas, since they have no use of words or any other general signs." And a little after: "Therefore, I think, we may suppose that it is in this that the species of brutes are discriminated from men, and it is that proper difference wherein they are wholly separated, and which at last widens to so wide a distance. For, if they have any ideas at all, and are not bare machines (as some would have them), we cannot deny them to have some reason. It seems as evident to me that they do, some of them, in certain instances reason as that they have sense; but it is only in particular ideas, just as they receive them from their senses. They are the best of them tied up within those narrow bounds, and have not (as I think) the faculty to enlarge them by any kind of abstraction."- Essay on Human Understanding, II. xi. 10 and 11. I readily agree with this learned author, that the faculties of brutes can by no means attain to abstraction. But then if this be made the distinguishing property of that sort of animals, I fear a great many of those that pass for men must be reckoned into their number. The reason that is here assigned why we have no grounds to think brutes have abstract general ideas is, that we observe in them no use of words or any other general signs; which is built on this supposition- that the making use of words implies the having general ideas. From which it follows that men who use language are able to abstract or generalize their ideas. That this is the sense and arguing of the author will further appear by his answering the question he in another place puts: "Since all things that exist are only particulars, how come we by general terms?" His answer is: "Words become general by being made the signs of general ideas."- Essay on Human Understanding, IV. iii. 6. But it seems that a word becomes general by being made the sign, not of an abstract general idea, but of several particular ideas, any one of which it indifferently suggests to the mind. For example, when it is said "the change of motion is proportional to the impressed force," or that "whatever has extension is divisible," these propositions are to be understood of motion and extension in general; and nevertheless it will not follow that they suggest to my thoughts an idea of motion without a body moved, or any determinate direction and velocity, or that I must conceive an abstract general idea of extension, which is neither line, surface, nor solid, neither great nor small, black, white, nor red, nor of any other determinate colour. It is only implied that whatever particular motion I consider, whether it be swift or slow, perpendicular, horizontal, or oblique, or in whatever object, the axiom concerning it holds equally true. As does the other of every particular extension, it matters not whether line, surface, or solid,

whether of this or that magnitude or figure.

12. By observing how ideas become general we may the better judge how words are made so. And here it is to be noted that I do not deny absolutely there are general ideas, but only that there are any abstract general ideas; for, in the passages we have quoted wherein there is mention of general ideas, it is always supposed that they are formed by abstraction, after the manner set forth in sections 8 and 9. Now, if we will annex a meaning to our words, and speak only of what we can conceive, I believe we shall acknowledge that an idea which, considered in itself, is particular, becomes general by being made to represent or stand for all other particular ideas of the same sort. To make this plain by an example, suppose a geometrician is demonstrating the method of cutting a line in two equal parts. He draws, for instance, a black line of an inch in length: this, which in itself is a particular line, is nevertheless with regard to its signification general, since, as it is there used, it represents all particular lines whatsoever; so that what is demonstrated of it is demonstrated of all lines, or, in other words, of a line in general. And, as that particular line becomes general by being made a sign, so the name "line," which taken absolutely is particular, by being a sign is made general. And as the former owes its generality not to its being the sign of an abstract or general line, but of all particular right lines that may possibly exist, so the latter must be thought to derive its generality from the same cause, namely, the various particular lines which it indifferently denotes.

13. To give the reader a yet clearer view of the nature of abstract ideas, and the uses they are thought necessary to, I shall add one more passage out of the Essay on Human Understanding, (IV. vii. 9) which is as follows: "Abstract ideas are not so obvious or easy to children or the yet unexercised mind as particular ones. If they seem so to grown men it is only because by constant and familiar use they are made so. For, when we nicely reflect upon them, we shall find that general ideas are fictions and contrivances of the mind, that carry difficulty with them, and do not so easily offer themselves as we are apt to imagine. For example, does it not require some pains and skill to form the general idea of a triangle (which is yet none of the most abstract, comprehensive, and difficult); for it must be neither oblique nor rectangle, neither equilateral, equicrural, nor scalenon, but all and none of these at once? In effect, it is something imperfect that cannot exist, an idea wherein some parts of several different and inconsistent ideas are put together. It is true the mind in this imperfect state has need of such ideas, and makes all the haste to them it can, for the conveniency of communication and enlargement of knowledge, to both which it is naturally very much inclined. But yet one has reason to suspect such ideas are marks of our imperfection. At least this is enough to show that the most abstract and general ideas are not those that the mind is first and most easily acquainted with, nor such as its earliest knowledge is conversant about."- If any man has the faculty of framing in his mind such an idea of a triangle as is here described, it is in vain to pretend to dispute him out of it, nor would I

go about it. All I desire is that the reader would fully and certainly inform himself whether he has such an idea or no. And this, methinks, can be no hard task for anyone to perform. What more easy than for anyone to look a little into his own thoughts, and there try whether he has, or can attain to have, an idea that shall correspond with the description that is here given of the general idea of a triangle, which is "neither oblique nor rectangle, equilateral, equicrural nor scalenon, but all and none of these at once?"

14. Much is here said of the difficulty that abstract ideas carry with them, and the pains and skill requisite to the forming them. And it is on all hands agreed that there is need of great toil and labour of the mind, to emancipate our thoughts from particular objects, and raise them to those sublime speculations that are conversant about abstract ideas. From all which the natural consequence should seem to be, that so difficult a thing as the forming abstract ideas was not necessary for communication, which is so easy and familiar to all sorts of men. But, we are told, if they seem obvious and easy to grown men, it is only because by constant and familiar use they are made so. Now, I would fain know at what time it is men are employed in surmounting that difficulty, and furnishing themselves with those necessary helps for discourse. It cannot be when they are grown up, for then it seems they are not conscious of any such painstaking; it remains therefore to be the business of their childhood. And surely the great and multiplied labour of framing abstract notions will be found a hard task for that tender age. Is it not a hard thing to imagine that a couple of children cannot prate together of their sugar-plums and rattles and the rest of their little trinkets, till they have first tacked together numberless inconsistencies, and so framed in their minds abstract general ideas, and annexed them to every common name they make use of?

15. Nor do I think them a whit more needful for the enlargement of knowledge than for communication. It is, I know, a point much insisted on, that all knowledge and demonstration are about universal notions, to which I fully agree: but then it doth not appear to me that those notions are formed by abstraction in the manner premised-universality, so far as I can comprehend, not consisting in the absolute, positive nature or conception of anything, but in the relation it bears to the particulars signified or represented by it; by virtue whereof it is that things, names, or notions, being in their own nature particular, are rendered universal. Thus, when I demonstrate any proposition concerning triangles, it is to be supposed that I have in view the universal idea of a triangle; which ought not to be understood as if I could frame an idea of a triangle which was neither equilateral, nor scalenon, nor equicrural; but only that the particular triangle I consider, whether of this or that sort it matters not, doth equally stand for and represent all rectilinear triangles whatsoever, and is in that sense universal. All which seems very plain and not to include any difficulty in it.

16. But here it will be demanded, how we can know any

proposition to be true of all particular triangles, except we have first seen it demonstrated of the abstract idea of a triangle which equally agrees to all? For, because a property may be demonstrated to agree to some one particular triangle, it will not thence follow that it equally belongs to any other triangle, which in all respects is not the same with it. For example, having demonstrated that the three angles of an isosceles rectangular triangle are equal to two right ones, I cannot therefore conclude this affection agrees to all other triangles which have neither a right angle nor two equal sides. It seems therefore that, to be certain this proposition is universally true, we must either make a particular demonstration for every particular triangle, which is impossible, or once for all demonstrate it of the abstract idea of a triangle, in which all the particulars do indifferently partake and by which they are all equally represented. To which I answer, that, though the idea I have in view whilst I make the demonstration be, for instance, that of an isosceles rectangular triangle whose sides are of a determinate length, I may nevertheless be certain it extends to all other rectilinear triangles, of what sort or bigness soever. And that because neither the right angle, nor the equality, nor determinate length of the sides are at all concerned in the demonstration. It is true the diagram I have in view includes all these particulars, but then there is not the least mention made of them in the proof of the proposition. It is not said the three angles are equal to two right ones, because one of them is a right angle, or because the sides comprehending it are of the same length. Which sufficiently shows that the right angle might have been oblique, and the sides unequal, and for all that the demonstration have held good. And for this reason it is that I conclude that to be true of any obliquangular or scalenon which I had demonstrated of a particular right-angled equicrural triangle, and not because I demonstrated the proposition of the abstract idea of a triangle And here it must be acknowledged that a man may consider a figure merely as triangular, without attending to the particular qualities of the angles, or relations of the sides. So far he may abstract; but this will never prove that he can frame an abstract, general, inconsistent idea of a triangle. In like manner we may consider Peter so far forth as man, or so far forth as animal without framing the fore-mentioned abstract idea, either of man or of animal, inasmuch as all that is perceived is not considered.

17. It were an endless as well as an useless thing to trace the Schoolmen, those great masters of abstraction, through all the manifold inextricable labyrinths of error and dispute which their doctrine of abstract natures and notions seems to have led them into. What bickerings and controversies, and what a learned dust have been raised about those matters, and what mighty advantage has been from thence derived to mankind, are things at this day too clearly known to need being insisted on. And it had been well if the ill effects of that doctrine were confined to those only who make the most avowed profession of it. When men consider the great pains, industry, and parts that have for so many ages been laid out on the cultivation and advancement of the sciences, and that notwithstanding all this the far greater part of them remains full of darkness

and uncertainty, and disputes that are like never to have an end, and even those that are thought to be supported by the most clear and cogent demonstrations contain in them paradoxes which are perfectly irreconcilable to the understandings of men, and that, taking all together, a very small portion of them does supply any real benefit to mankind, otherwise than by being an innocent diversion and amusement- I say the consideration of all this is apt to throw them into a despondency and perfect contempt of all study. But this may perhaps cease upon a view of the false principles that have obtained in the world, amongst all which there is none, methinks, hath a more wide and extended sway over the thoughts of speculative men than this of abstract general ideas.

18. I come now to consider the source of this prevailing notion, and that seems to me to be language. And surely nothing of less extent than reason itself could have been the source of an opinion so universally received. The truth of this appears as from other reasons so also from the plain confession of the ablest patrons of abstract ideas, who acknowledge that they are made in order to naming; from which it is a clear consequence that if there had been no such things as speech or universal signs there never had been any thought of abstraction. See III. vi. 39, and elsewhere of the Essay on Human Understanding. Let us examine the manner wherein words have contributed to the origin of that mistake.- First then, it is thought that every name has, or ought to have, one only precise and settled signification, which inclines men to think there are certain abstract, determinate ideas that constitute the true and only immediate signification of each general name; and that it is by the mediation of these abstract ideas that a general name comes to signify any particular thing. Whereas, in truth, there is no such thing as one precise and definite signification annexed to any general name, they all signifying indifferently a great number of particular ideas. All which doth evidently follow from what has been already said, and will clearly appear to anyone by a little reflexion. To this it will be objected that every name that has a definition is thereby restrained to one certain signification. For example, a triangle is defined to be "a plain surface comprehended by three right lines," by which that name is limited to denote one certain idea and no other. To which I answer, that in the definition it is not said whether the surface be great or small, black or white, nor whether the sides are long or short, equal or unequal, nor with what angles they are inclined to each other; in all which there may be great variety, and consequently there is no one settled idea which limits the signification of the word triangle. It is one thing for to keep a name constantly to the same definition, and another to make it stand everywhere for the same idea; the one is necessary, the other useless and impracticable.

19. But, to give a farther account how words came to produce the doctrine of abstract ideas, it must be observed that it is a received opinion that language has no other end but the communicating our ideas, and that every significant name stands for an idea. This being so, and it being withal certain that names which yet are not thought altogether

insignificant do not always mark out particular conceivable ideas, it is straightway concluded that they stand for abstract notions. That there are many names in use amongst speculative men which do not always suggest to others determinate, particular ideas, or in truth anything at all, is what nobody will deny. And a little attention will discover that it is not necessary (even in the strictest reasonings) significant names which stand for ideas should, every time they are used, excite in the understanding the ideas they are made to stand for- in reading and discoursing, names being for the most part used as letters are in Algebra, in which, though a particular quantity be marked by each letter, yet to proceed right it is not requisite that in every step each letter suggest to your thoughts that particular quantity it was appointed to stand for.

20. Besides, the communicating of ideas marked by words is not the chief and only end of language, as is commonly supposed. There are other ends, as the raising of some passion, the exciting to or deterring from an action, the putting the mind in some particular disposition- to which the former is in many cases barely subservient, and sometimes entirely omitted, when these can be obtained without it, as I think does not unfrequently happen in the familiar use of language. I entreat the reader to reflect with himself, and see if it doth not often happen, either in hearing or reading a discourse, that the passions of fear, love, hatred, admiration, disdain, and the like, arise immediately in his mind upon the perception of certain words, without any ideas coming between. At first, indeed, the words might have occasioned ideas that were fitting to produce those emotions; but, if I mistake not, it will be found that, when language is once grown familiar, the hearing of the sounds or sight of the characters is oft immediately attended with those passions which at first were wont to be produced by the intervention of ideas that are now quite omitted. May we not, for example, be affected with the promise of a good thing, though we have not an idea of what it is? Or is not the being threatened with danger sufficient to excite a dread, though we think not of any particular evil likely to befal us, nor yet frame to ourselves an idea of danger in abstract? If any one shall join ever so little reflexion of his own to what has been said, I believe that it will evidently appear to him that general names are often used in the propriety of language without the speaker's designing them for marks of ideas in his own, which he would have them raise in the mind of the hearer. Even proper names themselves do not seem always spoken with a design to bring into our view the ideas of those individuals that are supposed to be marked by them. For example, when a schoolman tells me "Aristotle hath said it," all I conceive he means by it is to dispose me to embrace his opinion with the deference and submission which custom has annexed to that name. And this effect is often so instantly produced in the minds of those who are accustomed to resign their judgment to authority of that philosopher, as it is impossible any idea either of his person, writings, or reputation should go before. Innumerable examples of this kind may be given, but why should I insist on those things which every one's experience will, I doubt not, plentifully

suggest unto him?

21. We have, I think, shewn the impossibility of Abstract Ideas. We have considered what has been said for them by their ablest patrons; and endeavored to show they are of no use for those ends to which they are thought necessary. And lastly, we have traced them to the source from whence they flow, which appears evidently to be language.- It cannot be denied that words are of excellent use, in that by their means all that stock of knowledge which has been purchased by the joint labours of inquisitive men in all ages and nations may be drawn into the view and made the possession of one single person. But at the same time it must be owned that most parts of knowledge have been strangely perplexed and darkened by the abuse of words, and general ways of speech wherein they are delivered. Since therefore words are so apt to impose on the understanding, whatever ideas I consider, I shall endeavour to take them bare and naked into my view, keeping out of my thoughts so far as I am able, those names which long and constant use hath so strictly united with them; from which I may expect to derive the following advantages:

22. First, I shall be sure to get clear of all controversies purely verbal- the springing up of which weeds in almost all the sciences has been a main hindrance to the growth of true and sound knowledge. Secondly, this seems to be a sure way to extricate myself out of that fine and subtle net of abstract ideas which has so miserably perplexed and entangled the minds of men; and that with this peculiar circumstance, that by how much the finer and more curious was the wit of any man, by so much the deeper was he likely to be ensnared and faster held therein. Thirdly, so long as I confine my thoughts to my own ideas divested of words, I do not see how I can easily be mistaken. The objects I consider, I clearly and adequately know. I cannot be deceived in thinking I have an idea which I have not. It is not possible for me to imagine that any of my own ideas are alike or unlike that are not truly so. To discern the agreements or disagreements there are between my ideas, to see what ideas are included in any compound idea and what not, there is nothing more requisite than an attentive perception of what passes in my own understanding.

23. But the attainment of all these advantages doth presuppose an entire deliverance from the deception of words, which I dare hardly promise myself; so difficult a thing it is to dissolve an union so early begun, and confirmed by so long a habit as that betwixt words and ideas. Which difficulty seems to have been very much increased by the doctrine of abstraction. For, so long as men thought abstract ideas were annexed to their words, it doth not seem strange that they should use words for ideas- it being found an impracticable thing to lay aside the word, and retain the abstract idea in the mind, which in itself was perfectly inconceivable. This seems to me the principal cause why those men who have so emphatically recommended to others the laying aside all use of words in their meditations, and contemplating their bare ideas, have yet failed to perform it themselves. Of late many have been very sensible of the absurd opinions and insignificant disputes

which grow out of the abuse of words. And, in order to remedy these evils, they advise well, that we attend to the ideas signified, and draw off our attention from the words which signify them. But, how good soever this advice may be they have given others, it is plain they could not have a due regard to it themselves, so long as they thought the only immediate use of words was to signify ideas, and that the immediate signification of every general name was a determinate abstract idea.

24. But, these being known to be mistakes, a man may with greater ease prevent his being imposed on by words. He that knows he has no other than particular ideas, will not puzzle himself in vain to find out and conceive the abstract idea annexed to any name. And he that knows names do not always stand for ideas will spare himself the labour of looking for ideas where there are none to be had. It were, therefore, to be wished that everyone would use his utmost endeavours to obtain a clear view of the ideas he would consider, separating from them all that dress and incumbrance of words which so much contribute to blind the judgment and divide the attention. In vain do we extend our view into the heavens and pry into the entrails of the earth, in vain do we consult the writings of learned men and trace the dark footsteps of antiquity- we need only draw the curtain of words, to hold the fairest tree of knowledge, whose fruit is excellent, and within the reach of our hand.

25. Unless we take care to clear the First Principles of Knowledge from the embarras and delusion of words, we may make infinite reasonings upon them to no purpose; we may draw consequences from consequences, and be never the wiser. The farther we go, we shall only lose ourselves the more irrecoverably, and be the deeper entangled in difficulties and mistakes. Whoever therefore designs to read the following sheets, I entreat him to make my words the occasion of his own thinking, and endeavour to attain the same train of thoughts in reading that I had in writing them. By this means it will be easy for him to discover the truth or falsity of what I say. He will be out of all danger of being deceived by my words, and I do not see how he can be led into an error by considering his own naked, undisguised ideas.

* * * *

A Treatise Concerning the Principles of Human Knowledge

1. It is evident to any one who takes a survey of the objects of human knowledge, that they are either ideas actually imprinted on the senses; or else such as are perceived by attending to the passions and operations of the mind; or lastly, ideas formed by help of memory and imagination- either compounding, dividing, or barely representing those originally perceived in the aforesaid ways. By sight I have the ideas of light and colours, with their several degrees and variations. By touch I perceive hard and soft, heat and cold, motion and resistance, and of all these more and less either as to quantity or degree. Smelling furnishes me with odours; the palate with tastes;

and hearing conveys sounds to the mind in all their variety of tone and composition. And as several of these are observed to accompany each other, they come to be marked by one name, and so to be reputed as one thing. Thus, for example a certain colour, taste, smell, figure and consistence having been observed to go together, are accounted one distinct thing, signified by the name apple; other collections of ideas constitute a stone, a tree, a book, and the like sensible things- which as they are pleasing or disagreeable excite the passions of love, hatred, joy, grief, and so forth.

2. But, besides all that endless variety of ideas or objects of knowledge, there is likewise something which knows or perceives them, and exercises divers operations, as willing, imagining, remembering, about them. This perceiving, active being is what I call mind, spirit, soul, or myself. By which words I do not denote any one of my ideas, but a thing entirely distinct from them, wherein, they exist, or, which is the same thing, whereby they are perceived- for the existence of an idea consists in being perceived.

3. That neither our thoughts, nor passions, nor ideas formed by the imagination, exist without the mind, is what everybody will allow. And it seems no less evident that the various sensations or ideas imprinted on the sense, however blended or combined together (that is, whatever objects they compose), cannot exist otherwise than in a mind perceiving them.- I think an intuitive knowledge may be obtained of this by any one that shall attend to what is meant by the term exists, when applied to sensible things. The table I write on I say exists, that is, I see and feel it; and if I were out of my study I should say it existed- meaning thereby that if I was in my study I might perceive it, or that some other spirit actually does perceive it. There was an odour, that is, it was smelt; there was a sound, that is, it was heard; a colour or figure, and it was perceived by sight or touch. This is all that I can understand by these and the like expressions. For as to what is said of the absolute existence of unthinking things without any relation to their being perceived, that seems perfectly unintelligible. Their esse is percepi, nor is it possible they should have any existence out of the minds or thinking things which perceive them.

4. It is indeed an opinion strangely prevailing amongst men, that houses, mountains, rivers, and in a word all sensible objects, have an existence, natural or real, distinct from their being perceived by the understanding. But, with how great an assurance and acquiescence soever this principle may be entertained in the world, yet whoever shall find in his heart to call it in question may, if I mistake not, perceive it to involve a manifest contradiction. For, what are the fore-mentioned objects but the things we perceive by sense? and what do we perceive besides our own ideas or sensations? and is it not plainly repugnant that any one of these, or any combination of them, should exist unperceived?

5. If we thoroughly examine this tenet it will,

perhaps, be found at bottom to depend on the doctrine of abstract ideas. For can there be a nicer strain of abstraction than to distinguish the existence of sensible objects from their being perceived, so as to conceive them existing unperceived? Light and colours, heat and cold, extension and figures- in a word the things we see and feel- what are they but so many sensations, notions, ideas, or impressions on the sense? and is it possible to separate, even in thought, any of these from perception? For my part, I might as easily divide a thing from itself. I may, indeed, divide in my thoughts, or conceive apart from each other, those things which, perhaps I never perceived by sense so divided. Thus, I imagine the trunk of a human body without the limbs, or conceive the smell of a rose without thinking on the rose itself. So far, I will not deny, I can abstract- if that may properly be called abstraction which extends only to the conceiving separately such objects as it is possible may really exist or be actually perceived asunder. But my conceiving or imagining power does not extend beyond the possibility of real existence or perception. Hence, as it is impossible for me to see or feel anything without an actual sensation of that thing, so is it impossible for me to conceive in my thoughts any sensible thing or object distinct from the sensation or perception of it.

6. Some truths there are so near and obvious to the mind that a man need only open his eyes to see them. Such I take this important one to be, viz., that all the choir of heaven and furniture of the earth, in a word all those bodies which compose the mighty frame of the world, have not any subsistence without a mind, that their being is to be perceived or known; that consequently so long as they are not actually perceived by me, or do not exist in my mind or that of any other created spirit, they must either have no existence at all, or else subsist in the mind of some Eternal Spirit- it being perfectly unintelligible, and involving all the absurdity of abstraction, to attribute to any single part of them an existence independent of a spirit. To be convinced of which, the reader need only reflect, and try to separate in his own thoughts the being of a sensible thing from its being perceived.

7. From what has been said it follows there is not any other Substance than Spirit, or that which perceives. But, for the fuller proof of this point, let it be considered the sensible qualities are colour, figure, motion, smell, taste, etc., i.e. the ideas perceived by sense. Now, for an idea to exist in an unperceiving thing is a manifest contradiction, for to have an idea is all one as to perceive; that therefore wherein colour, figure, and the like qualities exist must perceive them; hence it is clear there can be no unthinking substance or substratum of those ideas.

8. But, say you, though the ideas themselves do not exist without the mind, yet there may be things like them, whereof they are copies or resemblances, which things exist without the mind in an unthinking substance. I answer, an idea can be like nothing but an idea; a colour or figure can be like nothing but another colour or figure. If we look but never so little into our thoughts, we shall find it impossible for us to conceive a likeness except only between

our ideas. Again, I ask whether those supposed originals or external things, of which our ideas are the pictures or representations, be themselves perceivable or no? If they are, then they are ideas and we have gained our point; but if you say they are not, I appeal to any one whether it be sense to assert a colour is like something which is invisible; hard or soft, like something which is intangible; and so of the rest.

9. Some there are who make a distinction betwixt primary and secondary qualities. By the former they mean extension, figure, motion, rest, solidity or impenetrability, and number; by the latter they denote all other sensible qualities, as colours, sounds, tastes, and so forth. The ideas we have of these they acknowledge not to be the resemblances of anything existing without the mind, or unperceived, but they will have our ideas of the primary qualities to be patterns or images of things which exist without the mind, in an unthinking substance which they call Matter. By Matter, therefore, we are to understand an inert, senseless substance, in which extension, figure, and motion do actually subsist. But it is evident from what we have already shown, that extension, figure, and motion are only ideas existing in the mind, and that an idea can be like nothing but another idea, and that consequently neither they nor their archetypes can exist in an unperceiving substance. Hence, it is plain that that the very notion of what is called Matter or corporeal substance, involves a contradiction in it.

10. They who assert that figure, motion, and the rest of the primary or original qualities do exist without the mind in unthinking substances, do at the same time acknowledge that colours, sounds, heat cold, and suchlike secondary qualities, do not- which they tell us are sensations existing in the mind alone, that depend on and are occasioned by the different size, texture, and motion of the minute particles of matter. This they take for an undoubted truth, which they can demonstrate beyond all exception. Now, if it be certain that those original qualities are inseparably united with the other sensible qualities, and not, even in thought, capable of being abstracted from them, it plainly follows that they exist only in the mind. But I desire any one to reflect and try whether he can, by any abstraction of thought, conceive the extension and motion of a body without all other sensible qualities. For my own part, I see evidently that it is not in my power to frame an idea of a body extended and moving, but I must withal give it some colour or other sensible quality which is acknowledged to exist only in the mind. In short, extension, figure, and motion, abstracted from all other qualities, are inconceivable. Where therefore the other sensible qualities are, there must these be also, to wit, in the mind and nowhere else.

11. Again, great and small, swift and slow, are allowed to exist nowhere without the mind, being entirely relative, and changing as the frame or position of the organs of sense varies. The extension therefore which exists without the mind is neither great nor small, the motion neither swift nor slow, that is, they are nothing at all.

But, say you, they are extension in general, and motion in general: thus we see how much the tenet of extended movable substances existing without the mind depends on the strange doctrine of abstract ideas. And here I cannot but remark how nearly the vague and indeterminate description of Matter or corporeal substance, which the modern philosophers are run into by their own principles, resembles that antiquated and so much ridiculed notion of materia prima, to be met with in Aristotle and his followers. Without extension solidity cannot be conceived; since therefore it has been shewn that extension exists not in an unthinking substance, the same must also be true of solidity.

12. That number is entirely the creature of the mind, even though the other qualities be allowed to exist without, will be evident to whoever considers that the same thing bears a different denomination of number as the mind views it with different respects. Thus, the same extension is one, or three, or thirty-six, according as the mind considers it with reference to a yard, a foot, or an inch. Number is so visibly relative, and dependent on men's understanding, that it is strange to think how any one should give it an absolute existence without the mind. We say one book, one page, one line, etc.; all these are equally units, though some contain several of the others. And in each instance, it is plain, the unit relates to some particular combination of ideas arbitrarily put together by the mind.

13. Unity I know some will have to be a simple or uncompounded idea, accompanying all other ideas into the mind. That I have any such idea answering the word unity I do not find; and if I had, methinks I could not miss finding it: on the contrary, it should be the most familiar to my understanding, since it is said to accompany all other ideas, and to be perceived by all the ways of sensation and reflexion. To say no more, it is an abstract idea.

14. I shall farther add, that, after the same manner as modern philosophers prove certain sensible qualities to have no existence in Matter, or without the mind, the same thing may be likewise proved of all other sensible qualities whatsoever. Thus, for instance, it is said that heat and cold are affections only of the mind, and not at all patterns of real beings, existing in the corporeal substances which excite them, for that the same body which appears cold to one hand seems warm to another. Now, why may we not as well argue that figure and extension are not patterns or resemblances of qualities existing in Matter, because to the same eye at different stations, or eyes of a different texture at the same station, they appear various, and cannot therefore be the images of anything settled and determinate without the mind? Again, it is proved that sweetness is not really in the sapid thing, because the thing remaining unaltered the sweetness is changed into bitter, as in case of a fever or otherwise vitiated palate. Is it not as reasonable to say that motion is not without the mind, since if the succession of ideas in the mind become swifter, the motion, it is acknowledged, shall appear slower without any alteration in any external object?

15. In short, let any one consider those arguments

which are thought manifestly to prove that colours and taste exist only in the mind, and he shall find they may with equal force be brought to prove the same thing of extension, figure, and motion. Though it must be confessed this method of arguing does not so much prove that there is no extension or colour in an outward object, as that we do not know by sense which is the true extension or colour of the object. But the arguments foregoing plainly shew it to be impossible that any colour or extension at all, or other sensible quality whatsoever, should exist in an unthinking subject without the mind, or in truth, that there should be any such thing as an outward object.

16. But let us examine a little the received opinion.- It is said extension is a mode or accident of Matter, and that Matter is the substratum that supports it. Now I desire that you would explain to me what is meant by Matter's supporting extension. Say you, I have no idea of Matter and therefore cannot explain it. I answer, though you have no positive, yet, if you have any meaning at all, you must at least have a relative idea of Matter; though you know not what it is, yet you must be supposed to know what relation it bears to accidents, and what is meant by its supporting them. It is evident "support" cannot here be taken in its usual or literal sense- as when we say that pillars support a building; in what sense therefore must it be taken?

17. If we inquire into what the most accurate philosophers declare themselves to mean by material substance, we shall find them acknowledge they have no other meaning annexed to those sounds but the idea of Being in general, together with the relative notion of its supporting accidents. The general idea of Being appeareth to me the most abstract and incomprehensible of all other; and as for its supporting accidents, this, as we have just now observed, cannot be understood in the common sense of those words; it must therefore be taken in some other sense, but what that is they do not explain. So that when I consider the two parts or branches which make the signification of the words material substance, I am convinced there is no distinct meaning annexed to them. But why should we trouble ourselves any farther, in discussing this material substratum or support of figure and motion, and other sensible qualities? Does it not suppose they have an existence without the mind? And is not this a direct repugnancy, and altogether inconceivable?

18. But, though it were possible that solid, figured, movable substances may exist without the mind, corresponding to the ideas we have of bodies, yet how is it possible for us to know this? Either we must know it by sense or by reason. As for our senses, by them we have the knowledge only of our sensations, ideas, or those things that are immediately perceived by sense, call them what you will: but they do not inform us that things exist without the mind, or unperceived, like to those which are perceived. This the materialists themselves acknowledge. It remains therefore that if we have any knowledge at all of external things, it must be by reason, inferring their existence from what is immediately perceived by sense. But what reason can induce us to believe the existence of bodies without the mind, from

what we perceive, since the very patrons of Matter themselves do not pretend there is any necessary connexion betwixt them and our ideas? I say it is granted on all hands (and what happens in dreams, phrensies, and the like, puts it beyond dispute) that it is possible we might be affected with all the ideas we have now, though there were no bodies existing without resembling them. Hence, it is evident the supposition of external bodies is not necessary for the producing our ideas; since it is granted they are produced sometimes, and might possibly be produced always in the same order, we see them in at present, without their concurrence.

19. But, though we might possibly have all our sensations without them, yet perhaps it may be thought easier to conceive and explain the manner of their production, by supposing external bodies in their likeness rather than otherwise; and so it might be at least probable there are such things as bodies that excite their ideas in our minds. But neither can this be said; for, though we give the materialists their external bodies, they by their own confession are never the nearer knowing how our ideas are produced; since they own themselves unable to comprehend in what manner body can act upon spirit, or how it is possible it should imprint any idea in the mind. Hence it is evident the production of ideas or sensations in our minds can be no reason why we should suppose Matter or corporeal substances, since that is acknowledged to remain equally inexplicable with or without this supposition. If therefore it were possible for bodies to exist without the mind, yet to hold they do so, must needs be a very precarious opinion; since it is to suppose, without any reason at all, that God has created innumerable beings that are entirely useless, and serve to no manner of purpose.

20. In short, if there were external bodies, it is impossible we should ever come to know it; and if there were not, we might have the very same reasons to think there were that we have now. Suppose- what no one can deny possible- an intelligence without the help of external bodies, to be affected with the same train of sensations or ideas that you are, imprinted in the same order and with like vividness in his mind. I ask whether that intelligence hath not all the reason to believe the existence of corporeal substances, represented by his ideas, and exciting them in his mind, that you can possibly have for believing the same thing? Of this there can be no question- which one consideration were enough to make any reasonable person suspect the strength of whatever arguments be may think himself to have, for the existence of bodies without the mind.

21. Were it necessary to add any farther proof against the existence of Matter after what has been said, I could instance several of those errors and difficulties (not to mention impieties) which have sprung from that tenet. It has occasioned numberless controversies and disputes in philosophy, and not a few of far greater moment in religion. But I shall not enter into the detail of them in this place, as well because I think arguments a posteriori are unnecessary for confirming what has been, if I mistake not, sufficiently demonstrated a priori, as because I shall hereafter find occasion to speak somewhat of them.

22. I am afraid I have given cause to think I am needlessly prolix in handling this subject. For, to what purpose is it to dilate on that which may be demonstrated with the utmost evidence in a line or two, to any one that is capable of the least reflexion? It is but looking into your own thoughts, and so trying whether you can conceive it possible for a sound, or figure, or motion, or colour to exist without the mind or unperceived. This easy trial may perhaps make you see that what you contend for is a downright contradiction. Insomuch that I am content to put the whole upon this issue:- If you can but conceive it possible for one extended movable substance, or, in general, for any one idea, or anything like an idea, to exist otherwise than in a mind perceiving it, I shall readily give up the cause. And, as for all that compages of external bodies you contend for, I shall grant you its existence, though you cannot either give me any reason why you believe it exists, or assign any use to it when it is supposed to exist. I say, the bare possibility of your opinions being true shall pass for an argument that it is so.

23. But, say you, surely there is nothing easier than for me to imagine trees, for instance, in a park, or books existing in a closet, and nobody by to perceive them. I answer, you may so, there is no difficulty in it; but what is all this, I beseech you, more than framing in your mind certain ideas which you call books and trees, and the same time omitting to frame the idea of any one that may perceive them? But do not you yourself perceive or think of them all the while? This therefore is nothing to the purpose; it only shews you have the power of imagining or forming ideas in your mind: but it does not shew that you can conceive it possible the objects of your thought may exist without the mind. To make out this, it is necessary that you conceive them existing unconceived or unthought of, which is a manifest repugnancy. When we do our utmost to conceive the existence of external bodies, we are all the while only contemplating our own ideas. But the mind taking no notice of itself, is deluded to think it can and does conceive bodies existing unthought of or without the mind, though at the same time they are apprehended by or exist in itself. A little attention will discover to any one the truth and evidence of what is here said, and make it unnecessary to insist on any other proofs against the existence of material substance.

24. It is very obvious, upon the least inquiry into our thoughts, to know whether it is possible for us to understand what is meant by the absolute existence of sensible objects in themselves, or without the mind. To me it is evident those words mark out either a direct contradiction, or else nothing at all. And to convince others of this, I know no readier or fairer way than to entreat they would calmly attend to their own thoughts; and if by this attention the emptiness or repugnancy of those expressions does appear, surely nothing more is requisite for the conviction. It is on this therefore that I insist, to wit, that the absolute existence of unthinking things are words without a meaning, or which include a contradiction. This is what I repeat and inculcate, and earnestly recommend

to the attentive thoughts of the reader.

25. All our ideas, sensations, notions, or the things which we perceive, by whatsoever names they may be distinguished, are visibly inactive- there is nothing of power or agency included in them. So that one idea or object of thought cannot produce or make any alteration in another. To be satisfied of the truth of this, there is nothing else requisite but a bare observation of our ideas. For, since they and every part of them exist only in the mind, it follows that there is nothing in them but what is perceived: but whoever shall attend to his ideas, whether of sense or reflexion, will not perceive in them any power or activity; there is, therefore, no such thing contained in them. A little attention will discover to us that the very being of an idea implies passiveness and inertness in it, insomuch that it is impossible for an idea to do anything, or, strictly speaking, to be the cause of anything: neither can it be the resemblance or pattern of any active being, as is evident from sect. 8. Whence it plainly follows that extension, figure, and motion cannot be the cause of our sensations. To say, therefore, that these are the effects of powers resulting from the configuration, number, motion, and size of corpuscles, must certainly be false.

26. We perceive a continual succession of ideas, some are anew excited, others are changed or totally disappear. There is therefore some cause of these ideas, whereon they depend, and which produces and changes them. That this cause cannot be any quality or idea or combination of ideas, is clear from the preceding section. I must therefore be a substance; but it has been shewn that there is no corporeal or material substance: it remains therefore that the cause of ideas is an incorporeal active substance or Spirit.

27. A spirit is one simple, undivided, active being- as it perceives ideas it is called the understanding, and as it produces or otherwise operates about them it is called the will. Hence there can be no idea formed of a soul or spirit; for all ideas whatever, being passive and inert (vide sect. 25), they cannot represent unto us, by way of image or likeness, that which acts. A little attention will make it plain to any one, that to have an idea which shall be like that active principle of motion and change of ideas is absolutely impossible. Such is the nature of spirit, or that which acts, that it cannot be of itself perceived, but only by the effects which it produceth. If any man shall doubt of the truth of what is here delivered, let him but reflect and try if he can frame the idea of any power or active being, and whether he has ideas of two principal powers, marked by the names will and understanding, distinct from each other as well as from a third idea of Substance or Being in general, with a relative notion of its supporting or being the subject of the aforesaid powers- which is signified by the name soul or spirit. This is what some hold; but, so far as I can see, the words will, soul, spirit, do not stand for different ideas, or, in truth, for any idea at all, but for something which is very different from ideas, and which, being an agent, cannot be like unto, or represented by, any idea whatsoever. Though it must be owned at the same time that we have some notion of soul,

spirit, and the operations of the mind: such as willing, loving, hating- inasmuch as we know or understand the meaning of these words.

28. I find I can excite ideas in my mind at pleasure, and vary and shift the scene as oft as I think fit. It is no more than willing, and straightway this or that idea arises in my fancy; and by the same power it is obliterated and makes way for another. This making and unmaking of ideas doth very properly denominate the mind active. Thus much is certain and grounded on experience; but when we think of unthinking agents or of exciting ideas exclusive of volition, we only amuse ourselves with words.

29. But, whatever power I may have over my own thoughts, I find the ideas actually perceived by Sense have not a like dependence on my will. When in broad daylight I open my eyes, it is not in my power to choose whether I shall see or no, or to determine what particular objects shall present themselves to my view; and so likewise as to the hearing and other senses; the ideas imprinted on them are not creatures of my will. There is therefore some other Will or Spirit that produces them.

30. The ideas of Sense are more strong, lively, and distinct than those of the imagination; they have likewise a steadiness, order, and coherence, and are not excited at random, as those which are the effects of human wills often are, but in a regular train or series, the admirable connexion whereof sufficiently testifies the wisdom and benevolence of its Author. Now the set rules or established methods wherein the Mind we depend on excites in us the ideas of sense, are called the laws of nature; and these we learn by experience, which teaches us that such and such ideas are attended with such and such other ideas, in the ordinary course of things.

31. This gives us a sort of foresight which enables us to regulate our actions for the benefit of life. And without this we should be eternally at a loss; we could not know how to act anything that might procure us the least pleasure, or remove the least pain of sense. That food nourishes, sleep refreshes, and fire warms us; that to sow in the seed-time is the way to reap in the harvest; and in general that to obtain such or such ends, such or such means are conducive- all this we know, not by discovering any necessary connexion between our ideas, but only by the observation of the settled laws of nature, without which we should be all in uncertainty and confusion, and a grown man no more know how to manage himself in the affairs of life than an infant just born.

32. And yet this consistent uniform working, which so evidently displays the goodness and wisdom of that Governing Spirit whose Will constitutes the laws of nature, is so far from leading our thoughts to Him, that it rather sends them wandering after second causes. For, when we perceive certain ideas of Sense constantly followed by other ideas and we know this is not of our own doing, we forthwith attribute power and agency to the ideas themselves, and make one the cause of another, than which nothing can be more absurd and

unintelligible. Thus, for example, having observed that when we perceive by sight a certain round luminous figure we at the same time perceive by touch the idea or sensation called heat, we do from thence conclude the sun to be the cause of heat. And in like manner perceiving the motion and collision of bodies to be attended with sound, we are inclined to think the latter the effect of the former.

33. The ideas imprinted on the Senses by the Author of nature are called real things; and those excited in the imagination being less regular, vivid, and constant, are more properly termed ideas, or images of things, which they copy and represent. But then our sensations, be they never so vivid and distinct, are nevertheless ideas, that is, they exist in the mind, or are perceived by it, as truly as the ideas of its own framing. The ideas of Sense are allowed to have more reality in them, that is, to be more strong, orderly, and coherent than the creatures of the mind; but this is no argument that they exist without the mind. They are also less dependent on the spirit, or thinking substance which perceives them, in that they are excited by the will of another and more powerful spirit; yet still they are ideas, and certainly no idea, whether faint or strong, can exist otherwise than in a mind perceiving it.

34. Before we proceed any farther it is necessary we spend some time in answering objections which may probably be made against the principles we have hitherto laid down. In doing of which, if I seem too prolix to those of quick apprehensions, I hope it may be pardoned, since all men do not equally apprehend things of this nature, and I am willing to be understood by every one.

First, then, it will be objected that by the foregoing principles all that is real and substantial in nature is banished out of the world, and instead thereof a chimerical scheme of ideas takes place. All things that exist, exist only in the mind, that is, they are purely notional. What therefore becomes of the sun, moon and stars? What must we think of houses, rivers, mountains, trees, stones; nay, even of our own bodies? Are all these but so many chimeras and illusions on the fancy? To all which, and whatever else of the same sort may be objected, I answer, that by the principles premised we are not deprived of any one thing in nature. Whatever we see, feel, hear, or anywise conceive or understand remains as secure as ever, and is as real as ever. There is a rerum natura, and the distinction between realities and chimeras retains its full force. This is evident from sect. 29, 30, and 33, where we have shewn what is meant by real things in opposition to chimeras or ideas of our own framing; but then they both equally exist in the mind, and in that sense they are alike ideas.

35. I do not argue against the existence of any one thing that we can apprehend either by sense or reflexion. That the things I see with my eyes and touch with my hands do exist, really exist, I make not the least question. The only thing whose existence we deny is that which philosophers call Matter or corporeal substance. And in doing of this there is no damage done to the rest of mankind, who, I dare say, will never miss it. The Atheist

indeed will want the colour of an empty name to support his impiety; and the Philosophers may possibly find they have lost a great handle for trifling and disputation.

36. If any man thinks this detracts from the existence or reality of things, he is very far from understanding what hath been premised in the plainest terms I could think of. Take here an abstract of what has been said:- There are spiritual substances, minds, or human souls, which will or excite ideas in themselves at pleasure; but these are faint, weak, and unsteady in respect of others they perceive by sense- which, being impressed upon them according to certain rules or laws of nature, speak themselves the effects of a mind more powerful and wise than human spirits. These latter are said to have more reality in them than the former:- by which is meant that they are more affecting, orderly, and distinct, and that they are not fictions of the mind perceiving them. And in this sense the sun that I see by day is the real sun, and that which I imagine by night is the idea of the former. In the sense here given of reality it is evident that every vegetable, star, mineral, and in general each part of the mundane system, is as much a real being by our principles as by any other. Whether others mean anything by the term reality different from what I do, I entreat them to look into their own thoughts and see.

37. I will be urged that thus much at least is true, to wit, that we take away all corporeal substances. To this my answer is, that if the word substance be taken in the vulgar sense- for a combination of sensible qualities, such as extension, solidity, weight, and the like- this we cannot be accused of taking away: but if it be taken in a philosophic sense- for the support of accidents or qualities without the mind- then indeed I acknowledge that we take it away, if one may be said to take away that which never had any existence, not even in the imagination.

38. But after all, say you, it sounds very harsh to say we eat and drink ideas, and are clothed with ideas. I acknowledge it does so- the word idea not being used in common discourse to signify the several combinations of sensible qualities which are called things; and it is certain that any expression which varies from the familiar use of language will seem harsh and ridiculous. But this doth not concern the truth of the proposition, which in other words is no more than to say, we are fed and clothed with those things which we perceive immediately by our senses. The hardness or softness, the colour, taste, warmth, figure, or suchlike qualities, which combined together constitute the several sorts of victuals and apparel, have been shewn to exist only in the mind that perceives them; and this is all that is meant by calling them ideas; which word if it was as ordinarily used as thing, would sound no harsher nor more ridiculous than it. I am not for disputing about the propriety, but the truth of the expression. If therefore you agree with me that we eat and drink and are clad with the immediate objects of sense, which cannot exist unperceived or without the mind, I shall readily grant it is more proper or conformable to custom that they should be called things rather than ideas.

39. If it be demanded why I make use of the word idea, and do not rather in compliance with custom call them things; I answer, I do it for two reasons:- first, because the term thing in contra-distinction to idea, is generally supposed to denote somewhat existing without the mind; secondly, because thing hath a more comprehensive signification than idea, including spirit or thinking things as well as ideas. Since therefore the objects of sense exist only in the mind, and are withal thoughtless and inactive, I chose to mark them by the word idea, which implies those properties.

40. But, say what we can, some one perhaps may be apt to reply, he will still believe his senses, and never suffer any arguments, how plausible soever, to prevail over the certainty of them. Be it so; assert the evidence of sense as high as you please, we are willing to do the same. That what I see, hear, and feel doth exist, that is to say, is perceived by me, I no more doubt than I do of my own being. But I do not see how the testimony of sense can be alleged as a proof for the existence of anything which is not perceived by sense. We are not for having any man turn sceptic and disbelieve his senses; on the contrary, we give them all the stress and assurance imaginable; nor are there any principles more opposite to Scepticism than those we have laid down, as shall be hereafter clearly shewn.

41. Secondly, it will be objected that there is a great difference betwixt real fire for instance, and the idea of fire, betwixt dreaming or imagining oneself burnt, and actually being so: if you suspect it to be only the idea of fire which you see, do but put your hand into it and you will be convinced with a witness. This and the like may be urged in opposition to our tenets. To all which the answer is evident from what hath been already said; and I shall only add in this place, that if real fire be very different from the idea of fire, so also is the real pain that it occasions very different from the idea of the same pain, and yet nobody will pretend that real pain either is, or can possibly be, in an unperceiving thing, or without the mind, any more than its idea.

42. Thirdly, it will be objected that we see things actually without or at distance from us, and which consequently do not exist in the mind; it being absurd that those things which are seen at the distance of several miles should be as near to us as our own thoughts. In answer to this, I desire it may be considered that in a dream we do oft perceive things as existing at a great distance off, and yet for all that, those things are acknowledged to have their existence only in the mind.

43. But, for the fuller clearing of this point, it may be worth while to consider how it is that we perceive distance and things placed at a distance by sight. For, that we should in truth see external space, and bodies actually existing in it, some nearer, others farther off, seems to carry with it some opposition to what hath been said of their existing nowhere without the mind. The consideration of this difficulty it was that gave birth to my "Essay towards a New Theory of Vision," which was published not

long since, wherein it is shewn that distance or outness is neither immediately of itself perceived by sight, nor yet apprehended or judged of by lines and angles, or anything that hath a necessary connexion with it; but that it is only suggested to our thoughts by certain visible ideas and sensations attending vision, which in their own nature have no manner of similitude or relation either with distance or things placed at a distance; but, by a connexion taught us by experience, they come to signify and suggest them to us, after the same manner that words of any language suggest the ideas they are made to stand for; insomuch that a man born blind and afterwards made to see, would not, at first sight, think the things he saw to be without his mind, or at any distance from him. See sect. 41 of the fore-mentioned treatise.

44. The ideas of sight and touch make two species entirely distinct and heterogeneous. The former are marks and prognostics of the latter. That the proper objects of sight neither exist without mind, nor are the images of external things, was shewn even in that treatise. Though throughout the same the contrary be supposed true of tangible objects- not that to suppose that vulgar error was necessary for establishing the notion therein laid down, but because it was beside my purpose to examine and refute it in a discourse concerning Vision. So that in strict truth the ideas of sight, when we apprehend by them distance and things placed at a distance, do not suggest or mark out to us things actually existing at a distance, but only admonish us what ideas of touch will be imprinted in our minds at such and such distances of time, and in consequence of such or such actions. It is, I say, evident from what has been said in the foregoing parts of this Treatise, and in sect. 147 and elsewhere of the Essay concerning Vision, that visible ideas are the Language whereby the Governing Spirit on whom we depend informs us what tangible ideas he is about to imprint upon us, in case we excite this or that motion in our own bodies. But for a fuller information in this point I refer to the Essay itself.

45. Fourthly, it will be objected that from the foregoing principles it follows things are every moment annihilated and created anew. The objects of sense exist only when they are perceived; the trees therefore are in the garden, or the chairs in the parlour, no longer than while there is somebody by to perceive them. Upon shutting my eyes all the furniture in the room is reduced to nothing, and barely upon opening them it is again created. In answer to all which, I refer the reader to what has been said in sect. 3, 4, &c., and desire he will consider whether he means anything by the actual existence of an idea distinct from its being perceived. For my part, after the nicest inquiry I could make, I am not able to discover that anything else is meant by those words; and I once more entreat the reader to sound his own thoughts, and not suffer himself to be imposed on by words. If he can conceive it possible either for his ideas or their archetypes to exist without being perceived, then I give up the cause; but if he cannot, he will acknowledge it is unreasonable for him to stand up in defence of he knows not what, and pretend to charge on me as an absurdity the not assenting to those propositions which

at bottom have no meaning in them.

46. It will not be amiss to observe how far the received principles of philosophy are themselves chargeable with those pretended absurdities. It is thought strangely absurd that upon closing my eyelids all the visible objects around me should be reduced to nothing; and yet is not this what philosophers commonly acknowledge, when they agree on all hands that light and colours, which alone are the proper and immediate objects of sight, are mere sensations that exist no longer than they are perceived? Again, it may to some perhaps seem very incredible that things should be every moment creating, yet this very notion is commonly taught in the schools. For the Schoolmen, though they acknowledge the existence of Matter, and that the whole mundane fabric is framed out of it, are nevertheless of opinion that it cannot subsist without the divine conservation, which by them is expounded to be a continual creation.

47. Farther, a little thought will discover to us that though we allow the existence of Matter or corporeal substance, yet it will unavoidably follow, from the principles which are now generally admitted, that the particular bodies, of what kind soever, do none of them exist whilst they are not perceived. For, it is evident from sect. II and the following sections, that the Matter philosophers contend for is an incomprehensible somewhat, which hath none of those particular qualities whereby the bodies falling under our senses are distinguished one from another. But, to make this more plain, it must be remarked that the infinite divisibility of Matter is now universally allowed, at least by the most approved and considerable philosophers, who on the received principles demonstrate it beyond all exception. Hence, it follows there is an infinite number of parts in each particle of Matter which are not perceived by sense. The reason therefore that any particular body seems to be of a finite magnitude, or exhibits only a finite number of parts to sense, is, not because it contains no more, since in itself it contains an infinite number of parts, but because the sense is not acute enough to discern them. In proportion therefore as the sense is rendered more acute, it perceives a greater number of parts in the object, that is, the object appears greater, and its figure varies, those parts in its extremities which were before unperceivable appearing now to bound it in very different lines and angles from those perceived by an obtuser sense. And at length, after various changes of size and shape, when the sense becomes infinitely acute the body shall seem infinite. During all which there is no alteration in the body, but only in the sense. Each body therefore, considered in itself, is infinitely extended, and consequently void of all shape or figure. From which it follows that, though we should grant the existence of Matter to be never so certain, yet it is withal as certain, the materialists themselves are by their own principles forced to acknowledge, that neither the particular bodies perceived by sense, nor anything like them, exists without the mind. Matter, I say, and each particle thereof, is according to them infinite and shapeless, and it is the mind that frames all that variety of bodies which compose the visible world, any one whereof

does not exist longer than it is perceived.

48. If we consider it, the objection proposed in sect. 45 will not be found reasonably charged on the principles we have premised, so as in truth to make any objection at all against our notions. For, though we hold indeed the objects of sense to be nothing else but ideas which cannot exist unperceived; yet we may not hence conclude they have no existence except only while they are perceived by us, since there may be some other spirit that perceives them though we do not. Wherever bodies are said to have no existence without the mind, I would not be understood to mean this or that particular mind, but all minds whatsoever. It does not therefore follow from the foregoing principles that bodies are annihilated and created every moment, or exist not at all during the intervals between our perception of them.

49. Fifthly, it may perhaps be objected that if extension and figure exist only in the mind, it follows that the mind is extended and figured; since extension is a mode or attribute which (to speak with the schools) is predicated of the subject in which it exists. I answer, those qualities are in the mind only as they are perceived by it- that is, not by way of mode or attribute, but only by way of idea; and it no more follows the soul or mind is extended, because extension exists in it alone, than it does that it is red or blue, because those colours are on all hands acknowledged to exist in it, and nowhere else. As to what philosophers say of subject and mode, that seems very groundless and unintelligible. For instance, in this proposition "a die is hard, extended, and square," they will have it that the word die denotes a subject or substance, distinct from the hardness, extension, and figure which are predicated of it, and in which they exist. This I cannot comprehend: to me a die seems to be nothing distinct from those things which are termed its modes or accidents. And, to say a die is hard, extended, and square is not to attribute those qualities to a subject distinct from and supporting them, but only an explication of the meaning of the word die.

50. Sixthly, you will say there have been a great many things explained by matter and motion; take away these and you destroy the whole corpuscular philosophy, and undermine those mechanical principles which have been applied with so much success to account for the phenomena. In short, whatever advances have been made, either by ancient or modern philosophers, in the study of nature do all proceed on the supposition that corporeal substance or Matter doth really exist. To this I answer that there is not any one phenomenon explained on that supposition which may not as well be explained without it, as might easily be made appear by an induction of particulars. To explain the phenomena, is all one as to shew why, upon such and such occasions, we are affected with such and such ideas. But how Matter should operate on a Spirit, or produce any idea in it, is what no philosopher will pretend to explain; it is therefore evident there can be no use of Matter in natural philosophy. Besides, they who attempt to account for things do it not by corporeal substance, but by figure, motion, and other qualities, which are in truth no more than mere ideas, and, therefore, cannot be the cause of anything, as hath been

already shewn. See sect. 25.

51. Seventhly, it will upon this be demanded whether it does not seem absurd to take away natural causes, and ascribe everything to the immediate operation of Spirits? We must no longer say upon these principles that fire heats, or water cools, but that a Spirit heats, and so forth. Would not a man be deservedly laughed at, who should talk after this manner? I answer, he would so; in such things we ought to "think with the learned, and speak with the vulgar." They who to demonstration are convinced of the truth of the Copernican system do nevertheless say "the sun rises," "the sun sets," or "comes to the meridian"; and if they affected a contrary style in common talk it would without doubt appear very ridiculous. A little reflexion on what is here said will make it manifest that the common use of language would receive no manner of alteration or disturbance from the admission of our tenets.

52. In the ordinary affairs of life, any phrases may be retained, so long as they excite in us proper sentiments, or dispositions to act in such a manner as is necessary for our well-being, how false soever they may be if taken in a strict and speculative sense. Nay, this is unavoidable, since, propriety being regulated by custom, language is suited to the received opinions, which are not always the truest. Hence it is impossible, even in the most rigid, philosophic reasonings, so far to alter the bent and genius of the tongue we speak, as never to give a handle for cavillers to pretend difficulties and inconsistencies. But, a fair and ingenuous reader will collect the sense from the scope and tenor and connexion of a discourse, making allowances for those inaccurate modes of speech which use has made inevitable.

53. As to the opinion that there are no Corporeal Causes, this has been heretofore maintained by some of the Schoolmen, as it is of late by others among the modern philosophers, who though they allow Matter to exist, yet will have God alone to be the immediate efficient cause of all things. These men saw that amongst all the objects of sense there was none which had any power or activity included in it; and that by consequence this was likewise true of whatever bodies they supposed to exist without the mind, like unto the immediate objects of sense. But then, that they should suppose an innumerable multitude of created beings, which they acknowledge are not capable of producing any one effect in nature, and which therefore are made to no manner of purpose, since God might have done everything as well without them: this I say, though we should allow it possible, must yet be a very unaccountable and extravagant supposition.

54. In the eighth place, the universal concurrent assent of mankind may be thought by some an invincible argument in behalf of Matter, or the existence of external things. Must we suppose the whole world to be mistaken? And if so, what cause can be assigned of so widespread and predominant an error? I answer, first, that, upon a narrow inquiry, it will not perhaps be found so many as is imagined do really believe the existence of Matter or things without

the mind. Strictly speaking, to believe that which involves a contradiction, or has no meaning in it, is impossible; and whether the foregoing expressions are not of that sort, I refer it to the impartial examination of the reader. In one sense, indeed, men may be said to believe that Matter exists, that is, they act as if the immediate cause of their sensations, which affects them every moment, and is so nearly present to them, were some senseless unthinking being. But, that they should clearly apprehend any meaning marked by those words, and form thereof a settled speculative opinion, is what I am not able to conceive. This is not the only instance wherein men impose upon themselves, by imagining they believe those propositions which they have often heard, though at bottom they have no meaning in them.

55. But secondly, though we should grant a notion to be never so universally and steadfastly adhered to, yet this is weak argument of its truth to whoever considers what a vast number of prejudices and false opinions are everywhere embraced with the utmost tenaciousness, by the unreflecting (which are the far greater) part of mankind. There was a time when the antipodes and motion of the earth were looked upon as monstrous absurdities even by men of learning: and if it be considered what a small proportion they bear to the rest of mankind, we shall find that at this day those notions have gained but a very inconsiderable footing in the world.

56. But it is demanded that we assign a cause of this prejudice, and account for its obtaining in the world. To this I answer, that men knowing they perceived several ideas, whereof they themselves were not the authors- as not being excited from within nor depending on the operation of their wills- this made them maintain those ideas, or objects of perception had an existence independent of and without the mind, without ever dreaming that a contradiction was involved in those words. But, philosophers having plainly seen that the immediate objects of perception do not exist without the mind, they in some degree corrected the mistake of the vulgar; but at the same time run into another which seems no less absurd, to wit, that there are certain objects really existing without the mind, or having a subsistence distinct from being perceived, of which our ideas are only images or resemblances, imprinted by those objects on the mind. And this notion of the philosophers owes its origin to the same cause with the former, namely, their being conscious that they were not the authors of their own sensations, which they evidently knew were imprinted from without, and which therefore must have some cause distinct from the minds on which they are imprinted.

57. But why they should suppose the ideas of sense to be excited in us by things in their likeness, and not rather have recourse to Spirit which alone can act, may be accounted for, first, because they were not aware of the repugnancy there is, as well in supposing things like unto our ideas existing without, as in attributing to them power or activity. Secondly, because the Supreme Spirit which excites those ideas in our minds, is not marked out and limited to our view by any particular finite collection of sensible ideas, as human agents are by their size,

complexion, limbs, and motions. And thirdly, because His operations are regular and uniform. Whenever the course of nature is interrupted by a miracle, men are ready to own the presence of a superior agent. But, when we see things go on in the ordinary course they do not excite in us any reflexion; their order and concatenation, though it be an argument of the greatest wisdom, power, and goodness in their creator, is yet so constant and familiar to us that we do not think them the immediate effects of a Free Spirit; especially since inconsistency and mutability in acting, though it be an imperfection, is looked on as a mark of freedom.

58. Tenthly, it will be objected that the notions we advance are inconsistent with several sound truths in philosophy and mathematics. For example, the motion of the earth is now universally admitted by astronomers as a truth grounded on the clearest and most convincing reasons. But, on the foregoing principles, there can be no such thing. For, motion being only an idea, it follows that if it be not perceived it exists not; but the motion of the earth is not perceived by sense. I answer, that tenet, if rightly understood, will be found to agree with the principles we have premised; for, the question whether the earth moves or no amounts in reality to no more than this, to wit, whether we have reason to conclude, from what has been observed by astronomers, that if we were placed in such and such circumstances, and such or such a position and distance both from the earth and sun, we should perceive the former to move among the choir of the planets, and appearing in all respects like one of them; and this, by the established rules of nature which we have no reason to mistrust, is reasonably collected from the phenomena.

59. We may, from the experience we have had of the train and succession of ideas in our minds, often make, I will not say uncertain conjectures, but sure and well-grounded predictions concerning the ideas we shall be affected with pursuant to a great train of actions, and be enabled to pass a right judgment of what would have appeared to us, in case we were placed in circumstances very different from those we are in at present. Herein consists the knowledge of nature, which may preserve its use and certainty very consistently with what hath been said. It will be easy to apply this to whatever objections of the like sort may be drawn from the magnitude of the stars, or any other discoveries in astronomy or nature.

60. In the eleventh place, it will be demanded to what purpose serves that curious organization of plants, and the animal mechanism in the parts of animals; might not vegetables grow, and shoot forth leaves of blossoms, and animals perform all their motions as well without as with all that variety of internal parts so elegantly contrived and put together; which, being ideas, have nothing powerful or operative in them, nor have any necessary connexion with the effects ascribed to them? If it be a Spirit that immediately produces every effect by a fiat or act of his will, we must think all that is fine and artificial in the works, whether of man or nature, to be made in vain. By this doctrine, though an artist hath made the spring and wheels,

and every movement of a watch, and adjusted them in such a manner as he knew would produce the motions he designed, yet he must think all this done to no purpose, and that it is an Intelligence which directs the index, and points to the hour of the day. If so, why may not the Intelligence do it, without his being at the pains of making the movements and putting them together? Why does not an empty case serve as well as another? And how comes it to pass that whenever there is any fault in the going of a watch, there is some corresponding disorder to be found in the movements, which being mended by a skilful hand all is right again? The like may be said of all the clockwork of nature, great part whereof is so wonderfully fine and subtle as scarce to be discerned by the best microscope. In short, it will be asked, how, upon our principles, any tolerable account can be given, or any final cause assigned of an innumerable multitude of bodies and machines, framed with the most exquisite art, which in the common philosophy have very apposite uses assigned them, and serve to explain abundance of phenomena?

61. To all which I answer, first, that though there were some difficulties relating to the administration of Providence, and the uses by it assigned to the several parts of nature, which I could not solve by the foregoing principles, yet this objection could be of small weight against the truth and certainty of those things which may be proved a priori, with the utmost evidence and rigor of demonstration. Secondly, but neither are the received principles free from the like difficulties; for, it may still be demanded to what end God should take those roundabout methods of effecting things by instruments and machines, which no one can deny might have been effected by the mere command of His will without all that apparatus; nay, if we narrowly consider it, we shall find the objection may be retorted with greater force on those who hold the existence of those machines without of mind; for it has been made evident that solidity, bulk, figure, motion, and the like have no activity or efficacy in them, so as to be capable of producing any one effect in nature. See sect. 25. Whoever therefore supposes them to exist (allowing the supposition possible) when they are not perceived does it manifestly to no purpose; since the only use that is assigned to them, as they exist unperceived, is that they produce those perceivable effects which in truth cannot be ascribed to anything but Spirit.

62. But, to come nigher the difficulty, it must be observed that though the fabrication of all those parts and organs be not absolutely necessary to the producing any effect, yet it is necessary to the producing of things in a constant regular way according to the laws of nature. There are certain general laws that run through the whole chain of natural effects; these are learned by the observation and study of nature, and are by men applied as well to the framing artificial things for the use and ornament of life as to the explaining various phenomena- which explication consists only in shewing the conformity any particular phenomenon hath to the general laws of nature, or, which is the same thing, in discovering the uniformity there is in the production of natural effects; as will be evident to

whoever shall attend to the several instances wherein philosophers pretend to account for appearances. That there is a great and conspicuous use in these regular constant methods of working observed by the Supreme Agent hath been shewn in sect. 31. And it is no less visible that a particular size, figure, motion, and disposition of parts are necessary, though not absolutely to the producing any effect, yet to the producing it according to the standing mechanical laws of nature. Thus, for instance, it cannot be denied that God, or the Intelligence that sustains and rules the ordinary course of things, might if He were minded to produce a miracle, cause all the motions on the dial-plate of a watch, though nobody had ever made the movements and put them in it: but yet, if He will act agreeably to the rules of mechanism, by Him for wise ends established and maintained in the creation, it is necessary that those actions of the watchmaker, whereby he makes the movements and rightly adjusts them, precede the production of the aforesaid motions; as also that any disorder in them be attended with the perception of some corresponding disorder in the movements, which being once corrected all is right again.

63. It may indeed on some occasions be necessary that the Author of nature display His overruling power in producing some appearance out of the ordinary series of things. Such exceptions from the general rules of nature are proper to surprise and awe men into an acknowledgement of the Divine Being; but then they are to be used but seldom, otherwise there is a plain reason why they should fail of that effect. Besides, God seems to choose the convincing our reason of His attributes by the works of nature, which discover so much harmony and contrivance in their make, and are such plain indications of wisdom and beneficence in their Author, rather than to astonish us into a belief of His Being by anomalous and surprising events.

64. To set this matter in a yet clearer light, I shall observe that what has been objected in sect. 60 amounts in reality to no more than this:- ideas are not anyhow and at random produced, there being a certain order and connexion between them, like to that of cause and effect; there are also several combinations of them made in a very regular and artificial manner, which seem like so many instruments in the hand of nature that, being hid as it were behind the scenes, have a secret operation in producing those appearances which are seen on the theatre of the world, being themselves discernible only to the curious eye of the philosopher. But, since one idea cannot be the cause of another, to what purpose is that connexion? And, since those instruments, being barely inefficacious perceptions in the mind, are not subservient to the production of natural effects, it is demanded why they are made; or, in other words, what reason can be assigned why God should make us, upon a close inspection into His works, behold so great variety of ideas so artfully laid together, and so much according to rule; it not being credible that He would be at the expense (if one may so speak) of all that art and regularity to no purpose.

65. To all which my answer is, first, that the

connexion of ideas does not imply the relation of cause and effect, but only of a mark or sign with the thing signified. The fire which I see is not the cause of the pain I suffer upon my approaching it, but the mark that forewarns me of it. In like manner the noise that I hear is not the effect of this or that motion or collision of the ambient bodies, but the sign thereof. Secondly, the reason why ideas are formed into machines, that is, artificial and regular combinations, is the same with that for combining letters into words. That a few original ideas may be made to signify a great number of effects and actions, it is necessary they be variously combined together. And, to the end their use be permanent and universal, these combinations must be made by rule, and with wise contrivance. By this means abundance of information is conveyed unto us, concerning what we are to expect from such and such actions and what methods are proper to be taken for the exciting such and such ideas; which in effect is all that I conceive to be distinctly meant when it is said that, by discerning a figure, texture, and mechanism of the inward parts of bodies, whether natural or artificial, we may attain to know the several uses and properties depending thereon, or the nature of the thing.

66. Hence, it is evident that those things which, under the notion of a cause co-operating or concurring to the production of effects, are altogether inexplicable, and run us into great absurdities, may be very naturally explained, and have a proper and obvious use assigned to them, when they are considered only as marks or signs for our information. And it is the searching after and endeavouring to understand those signs instituted by the Author of Nature, that ought to be the employment of the natural philosopher; and not the pretending to explain things by corporeal causes, which doctrine seems to have too much estranged the minds of men from that active principle, that supreme and wise Spirit "in whom we live, move, and have our being."

67. In the twelfth place, it may perhaps be objected that- though it be clear from what has been said that there can be no such thing as an inert, senseless, extended, solid, figured, movable substance existing without the mind, such as philosophers describe Matter- yet, if any man shall leave out of his idea of matter the positive ideas of extension, figure, solidity and motion, and say that he means only by that word an inert, senseless substance, that exists without the mind or unperceived, which is the occasion of our ideas, or at the presence whereof God is pleased to excite ideas in us: it doth not appear but that Matter taken in this sense may possibly exist. In answer to which I say, first, that it seems no less absurd to suppose a substance without accidents, than it is to suppose accidents without a substance. But secondly, though we should grant this unknown substance may possibly exist, yet where can it be supposed to be? That it exists not in the mind is agreed; and that it exists not in place is no less certain- since all place or extension exists only in the mind, as hath been already proved. It remains therefore that it exists nowhere at all.

68. Let us examine a little the description that is

here given us of matter. It neither acts, nor perceives, nor is perceived; for this is all that is meant by saying it is an inert, senseless, unknown substance; which is a definition entirely made up of negatives, excepting only the relative notion of its standing under or supporting. But then it must be observed that it supports nothing at all, and how nearly this comes to the description of a nonentity I desire may be considered. But, say you, it is the unknown occasion, at the presence of which ideas are excited in us by the will of God. Now, I would fain know how anything can be present to us, which is neither perceivable by sense nor reflexion, nor capable of producing any idea in our minds, nor is at all extended, nor hath any form, nor exists in any place. The words "to be present," when thus applied, must needs be taken in some abstract and strange meaning, and which I am not able to comprehend.

69. Again, let us examine what is meant by occasion. So far as I can gather from the common use of language, that word signifies either the agent which produces any effect, or else something that is observed to accompany or go before it in the ordinary course of things. But when it is applied to Matter as above described, it can be taken in neither of those senses; for Matter is said to be passive and inert, and so cannot be an agent or efficient cause. It is also unperceivable, as being devoid of all sensible qualities, and so cannot be the occasion of our perceptions in the latter sense: as when the burning my finger is said to be the occasion of the pain that attends it. What therefore can be meant by calling matter an occasion? The term is either used in no sense at all, or else in some very distant from its received signification.

70. You will Perhaps say that Matter, though it be not perceived by us, is nevertheless perceived by God, to whom it is the occasion of exciting ideas in our minds. For, say you, since we observe our sensations to be imprinted in an orderly and constant manner, it is but reasonable to suppose there are certain constant and regular occasions of their being produced. That is to say, that there are certain permanent and distinct parcels of Matter, corresponding to our ideas, which, though they do not excite them in our minds, or anywise immediately affect us, as being altogether passive and unperceivable to us, they are nevertheless to God, by whom they art perceived, as it were so many occasions to remind Him when and what ideas to imprint on our minds; that so things may go on in a constant uniform manner.

71. In answer to this, I observe that, as the notion of Matter is here stated, the question is no longer concerning the existence of a thing distinct from Spirit and idea, from perceiving and being perceived; but whether there are not certain ideas of I know not what sort, in the mind of God which are so many marks or notes that direct Him how to produce sensations in our minds in a constant and regular method- much after the same manner as a musician is directed by the notes of music to produce that harmonious train and composition of sound which is called a tune, though they who hear the music do not perceive the notes, and may be entirely ignorant of them. But, this notion of Matter seems

too extravagant to deserve a confutation. Besides, it is in effect no objection against what we have advanced, viz. that there is no senseless unperceived substance.

72. If we follow the light of reason, we shall, from the constant uniform method of our sensations, collect the goodness and wisdom of the Spirit who excites them in our minds; but this is all that I can see reasonably concluded from thence. To me, I say, it is evident that the being of a spirit infinitely wise, good, and powerful is abundantly sufficient to explain all the appearances of nature. But, as for inert, senseless Matter, nothing that I perceive has any the least connexion with it, or leads to the thoughts of it. And I would fain see any one explain any the meanest phenomenon in nature by it, or shew any manner of reason, though in the lowest rank of probability, that he can have for its existence, or even make any tolerable sense or meaning of that supposition. For, as to its being an occasion, we have, I think, evidently shewn that with regard to us it is no occasion. It remains therefore that it must be, if at all, the occasion to God of exciting ideas in us; and what this amounts to we have just now seen.

73. It is worth while to reflect a little on the motives which induced men to suppose the existence of material substance; that so having observed the gradual ceasing and expiration of those motives or reasons, we may proportionably withdraw the assent that was grounded on them. First, therefore, it was thought that colour, figure, motion, and the rest of the sensible qualities or accidents, did really exist without the mind; and for this reason it seemed needful to suppose some unthinking substratum or substance wherein they did exist, since they could not be conceived to exist by themselves. Afterwards, in process of time, men being convinced that colours, sounds, and the rest of the sensible, secondary qualities had no existence without the mind, they stripped this substratum or material substance of those qualities, leaving only the primary ones, figure, motion, and suchlike, which they still conceived to exist without the mind, and consequently to stand in need of a material support. But, it having been shewn that none even of these can possibly exist otherwise than in a Spirit or Mind which perceives them it follows that we have no longer any reason to suppose the being of Matter; nay, that it is utterly impossible there should be any such thing, so long as that word is taken to denote an unthinking substratum of qualities or accidents wherein they exist without the mind.

74. But though it be allowed by the materialists themselves that Matter was thought of only for the sake of supporting accidents, and, the reason entirely ceasing, one might expect the mind should naturally, and without any reluctance at all, quit the belief of what was solely grounded thereon; yet the prejudice is riveted so deeply in our thoughts, that we can scarce tell how to part with it, and are therefore inclined, since the thing itself is indefensible, at least to retain the name, which we apply to I know not what abstracted and indefinite notions of being, or occasion, though without any show of reason, at least so far as I can see. For, what is there on our part, or what do we perceive, amongst all the ideas, sensations, notions

which are imprinted on our minds, either by sense or reflexion, from whence may be inferred the existence of an inert, thoughtless, unperceived occasion? and, on the other hand, on the part of an All-sufficient Spirit, what can there be that should make us believe or even suspect He is directed by an inert occasion to excite ideas in our minds?

75. It is a very extraordinary instance of the force of prejudice, and much to be lamented, that the mind of man retains so great a fondness, against all the evidence of reason, for a stupid thoughtless somewhat, by the interposition whereof it would as it were screen itself from the Providence of God, and remove it farther off from the affairs of the world. But, though we do the utmost we can to secure the belief of Matter, though, when reason forsakes us, we endeavour to support our opinion on the bare possibility of the thing, and though we indulge ourselves in the full scope of an imagination not regulated by reason to make out that poor possibility, yet the upshot of all is, that there are certain unknown Ideas in the mind of God; for this, if anything, is all that I conceive to be meant by occasion with regard to God. And this at the bottom is no longer contending for the thing, but for the name.

76. Whether therefore there are such Ideas in the mind of God, and whether they may be called by the name Matter, I shall not dispute. But, if you stick to the notion of an unthinking substance or support of extension, motion, and other sensible qualities, then to me it is most evidently impossible there should be any such thing, since it is a plain repugnancy that those qualities should exist in or be supported by an unperceiving substance.

77. But, say you, though it be granted that there is no thoughtless support of extension and the other qualities or accidents which we perceive, yet there may perhaps be some inert, unperceiving substance or substratum of some other qualities, as incomprehensible to us as colours are to a man born blind, because we have not a sense adapted to them. But, if we had a new sense, we should possibly no more doubt of their existence than a blind man made to see does of the existence of light and colours. I answer, first, if what you mean by the word Matter be only the unknown support of unknown qualities, it is no matter whether there is such a thing or no, since it no way concerns us; and I do not see the advantage there is in disputing about what we know not what, and we know not why.

78. But, secondly, if we had a new sense it could only furnish us with new ideas or sensations; and then we should have the same reason against their existing in an unperceiving substance that has been already offered with relation to figure, motion, colour and the like. Qualities, as hath been shewn, are nothing else but sensations or ideas, which exist only in a mind perceiving them; and this is true not only of the ideas we are acquainted with at present, but likewise of all possible ideas whatsoever.

79. But, you will insist, what if I have no reason to believe the existence of Matter? what if I cannot assign any use to it or explain anything by it, or even conceive what

is meant by that word? yet still it is no contradiction to say that Matter exists, and that this Matter is in general a substance, or occasion of ideas; though indeed to go about to unfold the meaning or adhere to any particular explication of those words may be attended with great difficulties. I answer, when words are used without a meaning, you may put them together as you please without danger of running into a contradiction. You may say, for example, that twice two is equal to seven, so long as you declare you do not take the words of that proposition in their usual acceptation but for marks of you know not what. And, by the same reason, you may say there is an inert thoughtless substance without accidents which is the occasion of our ideas. And we shall understand just as much by one proposition as the other.

80. In the last place, you will say, what if we give up the cause of material Substance, and stand to it that Matter is an unknown somewhat- neither substance nor accident, spirit nor idea, inert, thoughtless, indivisible, immovable, unextended, existing in no place. For, say you, whatever may be urged against substance or occasion, or any other positive or relative notion of Matter, hath no place at all, so long as this negative definition of Matter is adhered to. I answer, you may, if so it shall seem good, use the word "Matter" in the same sense as other men use "nothing," and so make those terms convertible in your style. For, after all, this is what appears to me to be the result of that definition, the parts whereof when I consider with attention, either collectively or separate from each other, I do not find that there is any kind of effect or impression made on my mind different from what is excited by the term nothing.

81. You will reply, perhaps, that in the fore-said definition is included what doth sufficiently distinguish it from nothing- the positive abstract idea of quiddity, entity, or existence. I own, indeed, that those who pretend to the faculty of framing abstract general ideas do talk as if they had such an idea, which is, say they, the most abstract and general notion of all; that is, to me, the most incomprehensible of all others. That there are a great variety of spirits of different orders and capacities, whose faculties both in number and extent are far exceeding those the Author of my being has bestowed on me, I see no reason to deny. And for me to pretend to determine by my own few, stinted narrow inlets of perception, what ideas the inexhaustible power of the Supreme Spirit may imprint upon them were certainly the utmost folly and presumption- since there may be, for aught that I know, innumerable sorts of ideas or sensations, as different from one another, and from all that I have perceived, as colours are from sounds. But, how ready soever I may be to acknowledge the scantiness of my comprehension with regard to the endless variety of spirits and ideas that may possibly exist, yet for any one to pretend to a notion of Entity or Existence, abstracted from spirit and idea, from perceived and being perceived, is, I suspect, a downright repugnancy and trifling with words.- It remains that we consider the objections which may possibly be made on the part of Religion.

82. Some there are who think that, though the arguments for the real existence of bodies which are drawn from Reason be allowed not to amount to demonstration, yet the Holy Scriptures are so clear in the point as will sufficiently convince every good Christian that bodies do really exist, and are something more than mere ideas; there being in Holy Writ innumerable facts related which evidently suppose the reality of timber and stone, mountains and rivers, and cities, and human bodies. To which I answer that no sort of writings whatever, sacred or profane, which use those and the like words in the vulgar acceptation, or so as to have a meaning in them, are in danger of having their truth called in question by our doctrine. That all those things do really exist, that there are bodies, even corporeal substances, when taken in the vulgar sense, has been shewn to be agreeable to our principles; and the difference betwixt things and ideas, realities and chimeras, has been distinctly explained. See sect. 29, 30, 33, 36, &c. And I do not think that either what philosophers call Matter, or the existence of objects without the mind, is anywhere mentioned in Scripture.

83. Again, whether there can be or be not external things, it is agreed on all hands that the proper use of words is the marking our conceptions, or things only as they are known and perceived by us; whence it plainly follows that in the tenets we have laid down there is nothing inconsistent with the right use and significancy of language, and that discourse, of what kind soever, so far as it is intelligible, remains undisturbed. But all this seems so manifest, from what has been largely set forth in the premises, that it is needless to insist any farther on it.

84. But, it will be urged that miracles do, at least, lose much of their stress and import by our principles. What must we think of Moses' rod? was it not really turned into a serpent; or was there only a change of ideas in the minds of the spectators? And, can it be supposed that our Saviour did no more at the marriage-feast in Cana than impose on the sight, and smell, and taste of the guests, so as to create in them the appearance or idea only of wine? The same may be said of all other miracles; which, in consequence of the foregoing principles, must be looked upon only as so many cheats, or illusions of fancy. To this I reply, that the rod was changed into a real serpent, and the water into real wine. That this does not in the least contradict what I have elsewhere said will be evident from sect. 34 and 35. But this business of real and imaginary has been already so plainly and fully explained, and so often referred to, and the difficulties about it are so easily answered from what has gone before, that it were an affront to the reader's understanding to resume the explication of it in its place. I shall only observe that if at table all who were present should see, and smell, and taste, and drink wine, and find the effects of it, with me there could be no doubt of its reality; so that at bottom the scruple concerning real miracles has no place at all on ours, but only on the received principles, and consequently makes rather for than against what has been said.

85. Having done with the Objections, which I

endeavoured to propose in the clearest light, and gave them all the force and weight I could, we proceed in the next place to take a view of our tenets in their Consequences. Some of these appear at first sight- as that several difficult and obscure questions, on which abundance of speculation has been thrown away, are entirely banished from philosophy. "Whether corporeal substance can think," "whether Matter be infinitely divisible," and "how it operates on spirit"- these and like inquiries have given infinite amusement to philosophers in all ages; but depending on the existence of Matter, they have no longer any place on our principles. Many other advantages there are, as well with regard to religion as the sciences, which it is easy for any one to deduce from what has been premised; but this will appear more plainly in the sequel.

86. From the principles we have laid down it follows human knowledge may naturally be reduced to two heads- that of ideas and that of spirits. Of each of these I shall treat in order.

And first as to ideas or unthinking things. Our knowledge of these hath been very much obscured and confounded, and we have been led into very dangerous errors, by supposing a twofold existence of the objects of sense- the one intelligible or in the mind, the other real and without the mind; whereby unthinking things are thought to have a natural subsistence of their own distinct from being perceived by spirits. This, which, if I mistake not, hath been shewn to be a most groundless and absurd notion, is the very root of Scepticism; for, so long as men thought that real things subsisted without the mind, and that their knowledge was only so far forth real as it was conformable to real things, it follows they could not be certain they had any real knowledge at all. For how can it be known that the things which are perceived are conformable to those which are not perceived, or exist without the mind?

87. Colour, figure, motion, extension, and the like, considered only as so many sensations in the mind, are perfectly known, there being nothing in them which is not perceived. But, if they are looked on as notes or images, referred to things or archetypes existing without the mind, then are we involved all in scepticism. We see only the appearances, and not the real qualities of things. What may be the extension, figure, or motion of anything really and absolutely, or in itself, it is impossible for us to know, but only the proportion or relation they bear to our senses. Things remaining the same, our ideas vary, and which of them, or even whether any of them at all, represent the true quality really existing in the thing, it is out of our reach to determine. So that, for aught we know, all we see, hear, and feel may be only phantom and vain chimera, and not at all agree with the real things existing in rerum natura. All this scepticism follows from our supposing a difference between things and ideas, and that the former have a subsistence without the mind or unperceived. It were easy to dilate on this subject, and show how the arguments urged by sceptics in all ages depend on the supposition of external objects.

88. So long as we attribute a real existence to unthinking things, distinct from their being perceived, it is not only impossible for us to know with evidence the nature of any real unthinking being, but even that it exists. Hence it is that we see philosophers distrust their senses, and doubt of the existence of heaven and earth, of everything they see or feel, even of their own bodies. And, after all their labour and struggle of thought, they are forced to own we cannot attain to any self-evident or demonstrative knowledge of the existence of sensible things. But, all this doubtfulness, which so bewilders and confounds the mind and makes philosophy ridiculous in the eyes of the world, vanishes if we annex a meaning to our words. and not amuse ourselves with the terms "absolute," "external," "exist, "and such-like, signifying we know not what. I can as well doubt of my own being as of the being of those things which I actually perceive by sense; it being a manifest contradiction that any sensible object should be immediately perceived by sight or touch, and at the same time have no existence in nature, since the very existence of an unthinking being consists in being perceived.

89. Nothing seems of more importance towards erecting a firm system of sound and real knowledge, which may be proof against the assaults of Scepticism, than to lay the beginning in a distinct explication of what is meant by thing, reality, existence; for in vain shall we dispute concerning the real existence of things, or pretend to any knowledge thereof, so long as we have not fixed the meaning of those words. Thing or Being is the most general name of all; it comprehends under it two kinds entirely distinct and heterogeneous, and which have nothing common but the name. viz. spirits and ideas. The former are active, indivisible substances: the latter are inert, fleeting, dependent beings, which subsist not by themselves, but are supported by, or exist in minds or spiritual substances. We comprehend our own existence by inward feeling or reflexion, and that of other spirits by reason. We may be said to have some knowledge or notion of our own minds, of spirits and active beings, whereof in a strict sense we have not ideas. In like manner, we know and have a notion of relations between things or ideas- which relations are distinct from the ideas or things related, inasmuch as the latter may be perceived by us without our perceiving the former. To me it seems that ideas, spirits, and relations are all in their respective kinds the object of human knowledge and subject of discourse; and that the term idea would be improperly extended to signify everything we know or have any notion of.

90. Ideas imprinted on the senses are real things, or do really exist; this we do not deny, but we deny they can subsist without the minds which perceive them, or that they are resemblances of any archetypes existing without the mind; since the very being of a sensation or idea consists in being perceived, and an idea can be like nothing but an idea. Again, the things perceived by sense may be termed external, with regard to their origin- in that they are not generated from within by the mind itself, but imprinted by a Spirit distinct from that which perceives them. Sensible objects may likewise be said to be "without the mind" in

another sense, namely when they exist in some other mind; thus, when I shut my eyes, the things I saw may still exist, but it must be in another mind.

91. It were a mistake to think that what is here said derogates in the least from the reality of things. It is acknowledged, on the received principles, that extension, motion, and in a word all sensible qualities have need of a support, as not being able to subsist by themselves. But the objects perceived by sense are allowed to be nothing but combinations of those qualities, and consequently cannot subsist by themselves. Thus far it is agreed on all hand. So that in denying the things perceived by sense an existence independent of a substance of support wherein they may exist, we detract nothing from the received opinion of their reality, and are guilty of no innovation in that respect. All the difference is that, according to us, the unthinking beings perceived by sense have no existence distinct from being perceived, and cannot therefore exist in any other substance than those unextended indivisible substances or spirits which act and think and perceive them; whereas philosophers vulgarly hold that the sensible qualities do exist in an inert, extended, unperceiving substance which they call Matter, to which they attribute a natural subsistence, exterior to all thinking beings, or distinct from being perceived by any mind whatsoever, even the eternal mind of the Creator, wherein they suppose only ideas of the corporeal substances created by him; if indeed they allow them to be at all created.

92. For, as we have shewn the doctrine of Matter or corporeal substance to have been the main pillar and support of Scepticism, so likewise upon the same foundation have been raised all the impious schemes of Atheism and Irreligion. Nay, so great a difficulty has it been thought to conceive Matter produced out of nothing, that the most celebrated among the ancient philosophers, even of those who maintained the being of a God, have thought Matter to be uncreated and co-eternal with Him. How great a friend material substance has been to Atheists in all ages were needless to relate. All their monstrous systems have so visible and necessary a dependence on it that, when this corner-stone is once removed, the whole fabric cannot choose but fall to the ground, insomuch that it is no longer worth while to bestow a particular consideration on the absurdities of every wretched sect of Atheists.

93. That impious and profane persons should readily fall in with those systems which favour their inclinations, by deriding immaterial substance, and supposing the soul to be divisible and subject to corruption as the body; which exclude all freedom, intelligence, and design from the formation of things, and instead thereof make a self-existent, stupid, unthinking substance the root and origin of all beings; that they should hearken to those who deny a Providence, or inspection of a Superior Mind over the affairs of the world, attributing the whole series of events either to blind chance or fatal necessity arising from the impulse of one body or another- all this is very natural. And, on the other hand, when men of better principles observe the enemies of religion lay so great a stress on

unthinking Matter, and all of them use so much industry and artifice to reduce everything to it, methinks they should rejoice to see them deprived of their grand support, and driven from that only fortress, without which your Epicureans, Hobbists, and the like, have not even the shadow of a pretence, but become the most cheap and easy triumph in the world.

94. The existence of Matter, or bodies unperceived, has not only been the main support of Atheists and Fatalists, but on the same principle doth Idolatry likewise in all its various forms depend. Did men but consider that the sun, moon, and stars, and every other object of the senses are only so many sensations in their minds, which have no other existence but barely being perceived, doubtless they would never fall down and worship their own ideas, but rather address their homage to that ETERNAL INVISIBLE MIND which produces and sustains all things.

95. The same absurd principle, by mingling itself with the articles of our faith, has occasioned no small difficulties to Christians. For example, about the Resurrection, how many scruples and objections have been raised by Socinians and others? But do not the most plausible of them depend on the supposition that a body is denominated the same, with regard not to the form or that which is perceived by sense, but the material substance, which remains the same under several forms? Take away this material substance, about the identity whereof all the dispute is, and mean by body what every plain ordinary person means by that word, to wit, that which is immediately seen and felt, which is only a combination of sensible qualities or ideas, and then their most unanswerable objections come to nothing.

96. Matter being once expelled out of nature drags with it so many sceptical and impious notions, such an incredible number of disputes and puzzling questions, which have been thorns in the sides of divines as well as philosophers, and made so much fruitless work for mankind, that if the arguments we have produced against it are not found equal to demonstration (as to me they evidently seem), yet I am sure all friends to knowledge, peace, and religion have reason to wish they were.

97. Beside the external existence of the objects of perception, another great source of errors and difficulties with regard to ideal knowledge is the doctrine of abstract ideas, such as it hath been set forth in the Introduction. The plainest things in the world, those we are most intimately acquainted with and perfectly know, when they are considered in an abstract way, appear strangely difficult and incomprehensible. Time, place, and motion, taken in particular or concrete, are what everybody knows, but, having passed through the hands of a metaphysician, they become too abstract and fine to be apprehended by men of ordinary sense. Bid your servant meet you at such a time in such a place, and he shall never stay to deliberate on the meaning of those words; in conceiving that particular time and place, or the motion by which he is to get thither, he finds not the least difficulty. But if time be taken

exclusive of all those particular actions and ideas that diversify the day, merely for the continuation of existence or duration in abstract, then it will perhaps gravel even a philosopher to comprehend it.

98. For my own part, whenever I attempt to frame a simple idea of time, abstracted from the succession of ideas in my mind, which flows uniformly and is participated by all beings, I am lost and embrangled in inextricable difficulties. I have no notion of it at all, only I hear others say it is infinitely divisible, and speak of it in such a manner as leads me to entertain odd thoughts of my existence; since that doctrine lays one under an absolute necessity of thinking, either that he passes away innumerable ages without a thought, or else that he is annihilated every moment of his life, both which seem equally absurd. Time therefore being nothing, abstracted from the sucession of ideas in our minds, it follows that the duration of any finite spirit must be estimated by the number of ideas or actions succeeding each other in that same spirit or mind. Hence, it is a plain consequence that the soul always thinks; and in truth whoever shall go about to divide in his thoughts, or abstract the existence of a spirit from its cogitation, will, I believe, find it no easy task.

99. So likewise when we attempt to abstract extension and motion from all other qualities, and consider them by themselves, we presently lose sight of them, and run into great extravagances. All which depend on a twofold abstraction; first, it is supposed that extension, for example, may be abstracted from all other sensible qualities; and secondly, that the entity of extension may be abstracted from its being perceived. But, whoever shall reflect, and take care to understand what he says, will, if I mistake not, acknowledge that all sensible qualities are alike sensations and alike real; that where the extension is, there is the colour, too, i.e., in his mind, and that their archetypes can exist only in some other mind; and that the objects of sense are nothing but those sensations combined, blended, or (if one may so speak) concreted together; none of all which can be supposed to exist unperceived.

100. What it is for a man to be happy, or an object good, every one may think he knows. But to frame an abstract idea of happiness, prescinded from all particular pleasure, or of goodness from everything that is good, this is what few can pretend to. So likewise a man may be just and virtuous without having precise ideas of justice and virtue. The opinion that those and the like words stand for general notions, abstracted from all particular persons and actions, seems to have rendered morality very difficult, and the study thereof of small use to mankind. And in effect the doctrine of abstraction has not a little contributed towards spoiling the most useful parts of knowledge.

101. The two great provinces of speculative science conversant about ideas received from sense, are Natural Philosophy and Mathematics; with regard to each of these I shall make some observations. And first I shall say somewhat

of Natural Philosophy. On this subject it is that the sceptics triumph. All that stock of arguments they produce to depreciate our faculties and make mankind appear ignorant and low, are drawn principally from this head, namely, that we are under an invincible blindness as to the true and real nature of things. This they exaggerate, and love to enlarge on. We are miserably bantered, say they, by our senses, and amused only with the outside and show of things. The real essence, the internal qualities and constitution of every the meanest object, is hid from our view; something there is in every drop of water, every grain of sand, which it is beyond the power of human understanding to fathom or comprehend. But, it is evident from what has been shewn that all this complaint is groundless, and that we are influenced by false principles to that degree as to mistrust our senses, and think we know nothing of those things which we perfectly comprehend.

102. One great inducement to our pronouncing ourselves ignorant of the nature of things is the current opinion that everything includes within itself the cause of its properties; or that there is in each object an inward essence which is the source whence its discernible qualities flow, and whereon they depend. Some have pretended to account for appearances by occult qualities, but of late they are mostly resolved into mechanical causes, to wit. the figure, motion, weight, and suchlike qualities, of insensible particles; whereas, in truth, there is no other agent or efficient cause than spirit, it being evident that motion, as well as all other ideas, is perfectly inert. See sect. 25. Hence, to endeavour to explain the production of colours or sounds, by figure, motion, magnitude, and the like, must needs be labour in vain. And accordingly we see the attempts of that kind are not at all satisfactory. Which may be said in general of those instances wherein one idea or quality is assigned for the cause of another. I need not say how many hypotheses and speculations are left out, and how much the study of nature is abridged by this doctrine.

103. The great mechanical principle now in vogue is attraction. That a stone falls to the earth, or the sea swells towards the moon, may to some appear sufficiently explained thereby. But how are we enlightened by being told this is done by attraction? Is it that that word signifies the manner of the tendency, and that it is by the mutual drawing of bodies instead of their being impelled or protruded towards each other? But, nothing is determined of the manner or action, and it may as truly (for aught we know) be termed "impulse," or "protrusion," as "attraction." Again, the parts of steel we see cohere firmly together, and this also is accounted for by attraction; but, in this as in the other instances, I do not perceive that anything is signified besides the effect itself; for as to the manner of the action whereby it is produced, or the cause which produces it, these are not so much as aimed at.

104. Indeed, if we take a view of the several phenomena, and compare them together, we may observe some likeness and conformity between them. For example, in the falling of a stone to the ground, in the rising of the sea towards the moon, in cohesion, crystallization, etc, there

is something alike, namely, an union or mutual approach of bodies. So that any one of these or the like phenomena may not seem strange or surprising to a man who has nicely observed and compared the effects of nature. For that only is thought so which is uncommon, or a thing by itself, and out of the ordinary course of our observation. That bodies should tend towards the centre of the earth is not thought strange, because it is what we perceive every moment of our lives. But, that they should have a like gravitation towards the centre of the moon may seem odd and unaccountable to most men, because it is discerned only in the tides. But a philosopher, whose thoughts take in a larger compass of nature, having observed a certain similitude of appearances, as well in the heavens as the earth, that argue innumerable bodies to have a mutual tendency towards each other, which he denotes by the general name "attraction," whatever can be reduced to that he thinks justly accounted for. Thus he explains the tides by the attraction of the terraqueous globe towards the moon, which to him does not appear odd or anomalous, but only a particular example of a general rule or law of nature.

105. If therefore we consider the difference there is betwixt natural philosophers and other men, with regard to their knowledge of the phenomena, we shall find it consists not in an exacter knowledge of the efficient cause that produces them- for that can be no other than the will of a spirit- but only in a greater largeness of comprehension, whereby analogies, harmonies, and agreements are discovered in the works of nature, and the particular effects explained, that is, reduced to general rules, see sect. 62, which rules, grounded on the analogy and uniformness observed in the production of natural effects, are most agreeable and sought after by the mind; for that they extend our prospect beyond what is present and near to us, and enable us to make very probable conjectures touching things that may have happened at very great distances of time and place, as well as to predict things to come; which sort of endeavour towards omniscience is much affected by the mind.

106. But we should proceed warily in such things, for we are apt to lay too great stress on analogies, and, to the prejudice of truth, humour that eagerness of the mind whereby it is carried to extend its knowledge into general theorems. For example, in the business of gravitation or mutual attraction, because it appears in many instances, some are straightway for pronouncing it universal; and that to attract and be attracted by every other body is an essential quality inherent in all bodies whatsoever. Whereas it is evident the fixed stars have no such tendency towards each other; and, so far is that gravitation from being essential to bodies that in some instances a quite contrary principle seems to shew itself; as in the perpendicular growth of plants, and the elasticity of the air. There is nothing necessary or essential in the case, but it depends entirely on the will of the Governing Spirit, who causes certain bodies to cleave together or tend towards each other according to various laws, whilst He keeps others at a fixed distance; and to some He gives a quite contrary tendency to fly asunder just as He sees convenient.

107. After what has been premised, I think we may lay down the following conclusions. First, it is plain philosophers amuse themselves in vain, when they inquire for any natural efficient cause, distinct from a mind or spirit. Secondly, considering the whole creation is the workmanship of a wise and good Agent, it should seem to become philosophers to employ their thoughts (contrary to what some hold) about the final causes of things; and I confess I see no reason why pointing out the various ends to which natural things are adapted, and for which they were originally with unspeakable wisdom contrived, should not be thought one good way of accounting for them, and altogether worthy a philosopher. Thirdly, from what has been premised no reason can be drawn why the history of nature should not still be studied, and observations and experiments made, which, that they are of use to mankind, and enable us to draw any general conclusions, is not the result of any immutable habitudes or relations between things themselves, but only of God's goodness and kindness to men in the administration of the world. See sect. 30 and 31 Fourthly, by a diligent observation of the phenomena within our view, we may discover the general laws of nature, and from them deduce the other phenomena; I do not say demonstrate, for all deductions of that kind depend on a supposition that the Author of nature always operates uniformly, and in a constant observance of those rules we take for principles: which we cannot evidently know.

108. Those men who frame general rules from the phenomena and afterwards derive the phenomena from those rules, seem to consider signs rather than causes. A man may well understand natural signs without knowing their analogy, or being able to say by what rule a thing is so or so. And, as it is very possible to write improperly, through too strict an observance of general grammar rules; so, in arguing from general laws of nature, it is not impossible we may extend the analogy too far, and by that means run into mistakes.

109. As in reading other books a wise man will choose to fix his thoughts on the sense and apply it to use, rather than lay them out in grammatical remarks on the language; so, in perusing the volume of nature, it seems beneath the dignity of the mind to affect an exactness in reducing each particular phenomenon to general rules, or shewing how it follows from them. We should propose to ourselves nobler views, namely, to recreate and exalt the mind with a prospect of the beauty, order. extent, and variety of natural things: hence, by proper inferences, to enlarge our notions of the grandeur, wisdom, and beneficence of the Creator; and lastly, to make the several parts of the creation, so far as in us lies, subservient to the ends they were designed for, God's glory, and the sustentation and comfort of ourselves and fellow-creatures.

110. The best key for the aforesaid analogy or natural Science will be easily acknowledged to be a certain celebrated Treatise of Mechanics. In the entrance of which justly admired treatise, Time, Space, and Motion are distinguished into absolute and relative, true and apparent, mathematical and vulgar; which distinction, as it is at

large explained by the author, does suppose these quantities to have an existence without the mind; and that they are ordinarily conceived with relation to sensible things, to which nevertheless in their own nature they bear no relation at all.

111. As for Time, as it is there taken in an absolute or abstracted sense, for the duration or perseverance of the existence of things, I have nothing more to add concerning it after what has been already said on that subject. Sect. 97 and 98. For the rest, this celebrated author holds there is an absolute Space, which, being unperceivable to sense, remains in itself similar and immovable; and relative space to be the measure thereof, which, being movable and defined by its situation in respect of sensible bodies, is vulgarly taken for immovable space. Place he defines to be that part of space which is occupied by any body; and according as the space is absolute or relative so also is the place. Absolute Motion is said to be the translation of a body from absolute place to absolute place, as relative motion is from one relative place to another. And, because the parts of absolute space do not fall under our senses, instead of them we are obliged to use their sensible measures, and so define both place and motion with respect to bodies which we regard as immovable. But, it is said in philosophical matters we must abstract from our senses, since it may be that none of those bodies which seem to be quiescent are truly so, and the same thing which is moved relatively may be really at rest; as likewise one and the same body may be in relative rest and motion, or even moved with contrary relative motions at the same time, according as its place is variously defined. All which ambiguity is to be found in the apparent motions, but not at all in the true or absolute, which should therefore be alone regarded in philosophy. And the true as we are told are distinguished from apparent or relative motions by the following properties.- First, in true or absolute motion all parts which preserve the same position with respect of the whole, partake of the motions of the whole. Secondly, the place being moved, that which is placed therein is also moved; so that a body moving in a place which is in motion doth participate the motion of its place. Thirdly, true motion is never generated or changed otherwise than by force impressed on the body itself. Fourthly, true motion is always changed by force impressed on the body moved. Fifthly, in circular motion barely relative there is no centrifugal force, which, nevertheless, in that which is true or absolute, is proportional to the quantity of motion.

112. But, notwithstanding what has been said, I must confess it does not appear to me that there can be any motion other than relative; so that to conceive motion there must be at least conceived two bodies, whereof the distance or position in regard to each other is varied. Hence, if there was one only body in being it could not possibly be moved. This seems evident, in that the idea I have of motion doth necessarily include relation.

113. But, though in every motion it be necessary to conceive more bodies than one, yet it may be that one only is moved, namely, that on which the force causing the change

in the distance or situation of the bodies, is impressed. For, however some may define relative motion, so as to term that body moved which changes its distance from some other body, whether the force or action causing that change were impressed on it or no, yet as relative motion is that which is perceived by sense, and regarded in the ordinary affairs of life, it should seem that every man of common sense knows what it is as well as the best philosopher. Now, I ask any one whether, in his sense of motion as he walks along the streets, the stones he passes over may be said to move, because they change distance with his feet? To me it appears that though motion includes a relation of one thing to another, yet it is not necessary that each term of the relation be denominated from it. As a man may think of somewhat which does not think, so a body may be moved to or from another body which is not therefore itself in motion.

114. As the place happens to be variously defined, the motion which is related to it varies. A man in a ship may be said to be quiescent with relation to the sides of the vessel, and yet move with relation to the land. Or he may move eastward in respect of the one, and westward in respect of the other. In the common affairs of life men never go beyond the earth to define the place of any body; and what is quiescent in respect of that is accounted absolutely to be so. But philosophers, who have a greater extent of thought, and juster notions of the system of things, discover even the earth itself to be moved. In order therefore to fix their notions they seem to conceive the corporeal world as finite, and the utmost unmoved walls or shell thereof to be the place whereby they estimate true motions. If we sound our own conceptions, I believe we may find all the absolute motion we can frame an idea of to be at bottom no other than relative motion thus defined. For, as hath been already observed, absolute motion, exclusive of all external relation, is incomprehensible; and to this kind of relative motion all the above-mentioned properties, causes, and effects ascribed to absolute motion will, if I mistake not, be found to agree. As to what is said of the centrifugal force, that it does not at all belong to circular relative motion, I do not see how this follows from the experiment which is brought to prove it. See Philosophiae Naturalis Principia Mathematica, in Schol. Def. VIII. For the water in the vessel at that time wherein it is said to have the greatest relative circular motion, hath, I think, no motion at all; as is plain from the foregoing section.

115. For, to denominate a body moved it is requisite, first, that it change its distance or situation with regard to some other body; and secondly, that the force occasioning that change be applied to it. If either of these be wanting, I do not think that, agreeably to the sense of mankind, or the propriety of language, a body can be said to be in motion. I grant indeed that it is possible for us to think a body which we see change its distance from some other to be moved, though it have no force applied to it (in which sense there may be apparent motion), but then it is because the force causing the change of distance is imagined by us to be applied or impressed on that body thought to move; which indeed shews we are capable of mistaking a thing to be in

motion which is not, and that is all.

116. From what has been said it follows that the philosophic consideration of motion does not imply the being of an absolute Space, distinct from that which is perceived by sense and related bodies; which that it cannot exist without the mind is clear upon the same principles that demonstrate the like of all other objects of sense. And perhaps, if we inquire narrowly, we shall find we cannot even frame an idea of pure Space exclusive of all body. This I must confess seems impossible, as being a most abstract idea. When I excite a motion in some part of my body, if it be free or without resistance, I say there is Space; but if I find a resistance, then I say there is Body; and in proportion as the resistance to motion is lesser or greater, I say the space is more or less pure. So that when I speak of pure or empty space, it is not to be supposed that the word "space" stands for an idea distinct from or conceivable without body and motion- though indeed we are apt to think every noun substantive stands for a distinct idea that may be separated from all others; which has occasioned infinite mistakes. When, therefore, supposing all the world to be annihilated besides my own body, I say there still remains pure Space, thereby nothing else is meant but only that I conceive it possible for the limbs of my body to be moved on all sides without the least resistance, but if that, too, were annihilated then there could be no motion, and consequently no Space. Some, perhaps, may think the sense of seeing doth furnish them with the idea of pure space; but it is plain from what we have elsewhere shewn, that the ideas of space and distance are not obtained by that sense. See the Essay concerning Vision.

117. What is here laid down seems to put an end to all those disputes and difficulties that have sprung up amongst the learned concerning the nature of pure Space. But the chief advantage arising from it is that we are freed from that dangerous dilemma, to which several who have employed their thoughts on that subject imagine themselves reduced, to wit, of thinking either that Real Space is God, or else that there is something beside God which is eternal, uncreated, infinite, indivisible, immutable. Both which may justly be thought pernicious and absurd notions. It is certain that not a few divines, as well as philosophers of great note, have, from the difficulty they found in conceiving either limits or annihilation of space, concluded it must be divine. And some of late have set themselves particularly to shew the incommunicable attributes of God agree to it. Which doctrine, how unworthy soever it may seem of the Divine Nature, yet I do not see how we can get clear of it, so long as we adhere to the received opinions.

118. Hitherto of Natural Philosophy: we come now to make some inquiry concerning that other great branch of speculative knowledge, to wit, Mathematics. These, how celebrated soever they may be for their clearness and certainty of demonstration, which is hardly anywhere else to be found, cannot nevertheless be supposed altogether free from mistakes, if in their principles there lurks some secret error which is common to the professors of those sciences with the rest of mankind. Mathematicians, though

they deduce their theorems from a great height of evidence, yet their first principles are limited by the consideration of quantity: and they do not ascend into any inquiry concerning those transcendental maxims which influence all the particular sciences, each part whereof, Mathematics not excepted, does consequently participate of the errors involved in them. That the principles laid down by mathematicians are true, and their way of deduction from those principles clear and incontestible, we do not deny; but, we hold there may be certain erroneous maxims of greater extent than the object of Mathematics, and for that reason not expressly mentioned, though tacitly supposed throughout the whole progress of that science; and that the ill effects of those secret unexamined errors are diffused through all the branches thereof. To be plain, we suspect the mathematicians are as well as other men concerned in the errors arising from the doctrine of abstract general ideas, and the existence of objects without the mind.

119. Arithmetic has been thought to have for its object abstract ideas of Number; of which to understand the properties and mutual habitudes, is supposed no mean part of speculative knowledge. The opinion of the pure and intellectual nature of numbers in abstract has made them in esteem with those philosophers who seem to have affected an uncommon fineness and elevation of thought. It hath set a price on the most trifling numerical speculations which in practice are of no use, but serve only for amusement; and hath therefore so far infected the minds of some, that they have dreamed of mighty mysteries involved in numbers, and attempted the explication of natural things by them. But, if we inquire into our own thoughts, and consider what has been premised, we may perhaps entertain a low opinion of those high flights and abstractions, and look on all inquiries, about numbers only as so many difficiles nugae, so far as they are not subservient to practice, and promote the benefit of life.

120. Unity in abstract we have before considered in sect. 13, from which and what has been said in the Introduction, it plainly follows there is not any such idea. But, number being defined a "collection of units," we may conclude that, if there be no such thing as unity or unit in abstract, there are no ideas of number in abstract denoted by the numeral names and figures. The theories therefore in Arithmetic. if they are abstracted from the names and figures, as likewise from all use and practice, as well as from the particular things numbered, can be supposed to have nothing at all for their object; hence we may see how entirely the science of numbers is subordinate to practice, and how jejune and trifling it becomes when considered as a matter of mere speculation.

121. However, since there may be some who, deluded by the specious show of discovering abstracted verities, waste their time in arithmetical theorems and problems which have not any use, it will not be amiss if we more fully consider and expose the vanity of that pretence; and this will plainly appear by taking a view of Arithmetic in its infancy, and observing what it was that originally put men on the study of that science, and to what scope they

directed it. It is natural to think that at first, men, for ease of memory and help of computation, made use of counters, or in writing of single strokes, points, or the like, each whereof was made to signify an unit, i.e., some one thing of whatever kind they had occasion to reckon. Afterwards they found out the more compendious ways of making one character stand in place of several strokes or points. And, lastly, the notation of the Arabians or Indians came into use, wherein, by the repetition of a few characters or figures, and varying the signification of each figure according to the place it obtains, all numbers may be most aptly expressed; which seems to have been done in imitation of language, so that an exact analogy is observed betwixt the notation by figures and names, the nine simple figures answering the nine first numeral names and places in the former, corresponding to denominations in the latter. And agreeably to those conditions of the simple and local value of figures, were contrived methods of finding, from the given figures or marks of the parts, what figures and how placed are proper to denote the whole, or vice versa. And having found the sought figures, the same rule or analogy being observed throughout, it is easy to read them into words; and so the number becomes perfectly known. For then the number of any particular things is said to be known, when we know the name of figures (with their due arrangement) that according to the standing analogy belong to them. For, these signs being known, we can by the operations of arithmetic know the signs of any part of the particular sums signified by them; and, thus computing in signs (because of the connexion established betwixt them and the distinct multitudes of things whereof one is taken for an unit), we may be able rightly to sum up, divide, and proportion the things themselves that we intend to number.

122. In Arithmetic, therefore, we regard not the things, but the signs, which nevertheless are not regarded for their own sake, but because they direct us how to act with relation to things, and dispose rightly of them. Now, agreeably to what we have before observed of words in general (sect. 19, Introd.) it happens here likewise that abstract ideas are thought to be signified by numeral names or characters, while they do not suggest ideas of particular things to our minds. I shall not at present enter into a more particular dissertation on this subject, but only observe that it is evident from what has been said, those things which pass for abstract truths and theorems concerning numbers, are in reality conversant about no object distinct from particular numeral things, except only names and characters, which originally came to be considered on no other account but their being signs, or capable to represent aptly whatever particular things men had need to compute. Whence it follows that to study them for their own sake would be just as wise, and to as good purpose as if a man, neglecting the true use or original intention and subserviency of language, should spend his time in impertinent criticisms upon words, or reasonings and controversies purely verbal.

123. From numbers we proceed to speak of Extension, which, considered as relative, is the object of Geometry. The infinite divisibility of finite extension, though it is

not expressly laid down either as an axiom or theorem in the elements of that science, yet is throughout the same everywhere supposed and thought to have so inseparable and essential a connexion with the principles and demonstrations in Geometry, that mathematicians never admit it into doubt, or make the least question of it. And, as this notion is the source from whence do spring all those amusing geometrical paradoxes which have such a direct repugnancy to the plain common sense of mankind, and are admitted with so much reluctance into a mind not yet debauched by learning; so it is the principal occasion of all that nice and extreme subtilty which renders the study of Mathematics so difficult and tedious. Hence, if we can make it appear that no finite extension contains innumerable parts, or is infinitely divisible, it follows that we shall at once clear the science of Geometry from a great number of difficulties and contradictions which have ever been esteemed a reproach to human reason, and withal make the attainment thereof a business of much less time and pains than it hitherto has been.

124. Every particular finite extension which may possibly be the object of our thought is an idea existing only in the mind, and consequently each part thereof must be perceived. If, therefore, I cannot perceive innumerable parts in any finite extension that I consider, it is certain they are not contained in it; but, it is evident that I cannot distinguish innumerable parts in any particular line, surface, or solid, which I either perceive by sense, or figure to myself in my mind: wherefore I conclude they are not contained in it. Nothing can be plainer to me than that the extensions I have in view are no other than my own ideas; and it is no less plain that I cannot resolve any one of my ideas into an infinite number of other ideas, that is, that they are not infinitely divisible. If by finite extension be meant something distinct from a finite idea, I declare I do not know what that is, and so cannot affirm or deny anything of it. But if the terms "extension," "parts," &c., are taken in any sense conceivable, that is, for ideas, then to say a finite quantity or extension consists of parts infinite in number is so manifest a contradiction, that every one at first sight acknowledges it to be so; and it is impossible it should ever gain the assent of any reasonable creature who is not brought to it by gentle and slow degrees, as a converted Gentile to the belief of transubstantiation. Ancient and rooted prejudices do often pass into principles; and those propositions which once obtain the force and credit of a principle, are not only themselves, but likewise whatever is deducible from them, thought privileged from all examination. And there is no absurdity so gross, which, by this means, the mind of man may not be prepared to swallow.

125. He whose understanding is possessed with the doctrine of abstract general ideas may be persuaded that (whatever be thought of the ideas of sense) extension in abstract is infinitely divisible. And one who thinks the objects of sense exist without the mind will perhaps in virtue thereof be brought to admit that a line but an inch long may contain innumerable parts- really existing, though too small to be discerned. These errors are grafted as well

in the minds of geometricians as of other men, and have a like influence on their reasonings; and it were no difficult thing to shew how the arguments from Geometry made use of to support the infinite divisibility of extension are bottomed on them. At present we shall only observe in general whence it is the mathematicians are all so fond and tenacious of that doctrine.

126. It hath been observed in another place that the theorems and demonstrations in Geometry are conversant about universal ideas (sect. 15, Introd.); where it is explained in what sense this ought to be understood, to wit, the particular lines and figures included in the diagram are supposed to stand for innumerable others of different sizes; or, in other words, the geometer considers them abstracting from their magnitude- which does not imply that he forms an abstract idea, but only that he cares not what the particular magnitude is, whether great or small, but looks on that as a thing different to the demonstration. Hence it follows that a line in the scheme but an inch long must be spoken of as though it contained ten thousand parts, since it is regarded not in itself, but as it is universal; and it is universal only in its signification, whereby it represents innumerable lines greater than itself, in which may be distinguished ten thousand parts or more, though there may not be above an inch in it. After this manner, the properties of the lines signified are (by a very usual figure) transferred to the sign, and thence, through mistake, though to appertain to it considered in its own nature.

127. Because there is no number of parts so great but it is possible there may be a line containing more, the inch-line is said to contain parts more than any assignable number; which is true, not of the inch taken absolutely, but only for the things signified by it. But men, not retaining that distinction in their thoughts, slide into a belief that the small particular line described on paper contains in itself parts innumerable. There is no such thing as the ten-thousandth part of an inch; but there is of a mile or diameter of the earth, which may be signified by that inch. When therefore I delineate a triangle on paper, and take one side not above an inch, for example, in length to be the radius, this I consider as divided into 10,000 or 100,000 parts or more; for, though the ten-thousandth part of that line considered in itself is nothing at all, and consequently may be neglected without an error or inconveniency, yet these described lines, being only marks standing for greater quantities, whereof it may be the ten-thousandth part is very considerable, it follows that, to prevent notable errors in practice, the radius must be taken of 10,000 parts or more.

128. From what has been said the reason is plain why, to the end any theorem become universal in its use, it is necessary we speak of the lines described on paper as though they contained parts which really they do not. In doing of which, if we examine the matter thoroughly, we shall perhaps discover that we cannot conceive an inch itself as consisting of, or being divisible into, a thousand parts, but only some other line which is far greater than an inch,

and represented by it; and that when we say a line is infinitely divisible, we must mean a line which is infinitely great. What we have here observed seems to be the chief cause why, to suppose the infinite divisibility of finite extension has been thought necessary in geometry.

129. The several absurdities and contradictions which flowed from this false principle might, one would think, have been esteemed so many demonstrations against it. But, by I know not what logic, it is held that proofs a posteriori are not to be admitted against propositions relating to infinity, as though it were not impossible even for an infinite mind to reconcile contradictions; or as if anything absurd and repugnant could have a necessary connexion with truth or flow from it. But, whoever considers the weakness of this pretence will think it was contrived on purpose to humour the laziness of the mind which had rather acquiesce in an indolent scepticism than be at the pains to go through with a severe examination of those principles it has ever embraced for true.

130. Of late the speculations about Infinities have run so high, and grown to such strange notions, as have occasioned no small scruples and disputes among the geometers of the present age. Some there are of great note who, not content with holding that finite lines may be divided into an infinite number of parts, do yet farther maintain that each of those infinitesimals is itself subdivisible into an infinity of other parts or infinitesimals of a second order, and so on ad infinitum. These, I say, assert there are infinitesimals of infinitesimals of infinitesimals, &c., without ever coming to an end; so that according to them an inch does not barely contain an infinite number of parts, but an infinity of an infinity of an infinity ad infinitum of parts. Others there be who hold all orders of infinitesimals below the first to be nothing at all; thinking it with good reason absurd to imagine there is any positive quantity or part of extension which, though multiplied infinitely, can never equal the smallest given extension. And yet on the other hand it seems no less absurd to think the square, cube or other power of a positive real root, should itself be nothing at all; which they who hold infinitesimals of the first order, denying all of the subsequent orders, are obliged to maintain.

131. Have we not therefore reason to conclude they are both in the wrong, and that there is in effect no such thing as parts infinitely small, or an infinite number of parts contained in any finite quantity? But you will say that if this doctrine obtains it will follow the very foundations of Geometry are destroyed, and those great men who have raised that science to so astonishing a height, have been all the while building a castle in the air. To this it may be replied that whatever is useful in geometry, and promotes the benefit of human life, does still remain firm and unshaken on our principles; that science considered as practical will rather receive advantage than any prejudice from what has been said. But to set this in a due light may be the proper business of another place. For the rest, though it should follow that some of the more intricate and subtle parts of Speculative Mathematics may be pared off

without any prejudice to truth, yet I do not see what damage will be thence derived to mankind. On the contrary, I think it were highly to be wished that men of great abilities and obstinate application would draw off their thoughts from those amusements, and employ them in the study of such things as lie nearer the concerns of life, or have a more direct influence on the manners.

132. It is be said that several theorems undoubtedly true are discovered by methods in which infinitesimals are made use of, which could never have been if their existence included a contradiction in it; I answer that upon a thorough examination it will not be found that in any instance it is necessary to make use of or conceive infinitesimal parts of finite lines, or even quantities less than the minimum sensible; nay, it will be evident this is never done, it being impossible.

133. By what we have premised, it is plain that very numerous and important errors have taken their rise from those false Principles which were impugned in the foregoing parts of this treatise; and the opposites of those erroneous tenets at the same time appear to be most fruitful Principles, from whence do flow innumerable consequences highly advantageous to true philosophy. as well as to religion. Particularly Matter, or the absolute existence of corporeal objects, hath been shewn to be that wherein the most avowed and pernicious enemies of all knowledge, whether human or divine, have ever placed their chief strength and confidence. And surely, if by distinguishing the real existence of unthinking things from their being perceived, and allowing them a subsistance of their own out of the minds of spirits, no one thing is explained in nature, but on the contrary a great many inexplicable difficulties arise; if the supposition of Matter is barely precarious, as not being grounded on so much as one single reason; if its consequences cannot endure the light of examination and free inquiry, but screen themselves under the dark and general pretence of "infinites being incomprehensible"; if withal the removal of this Matter be not attended with the least evil consequence; if it be not even missed in the world, but everything as well, nay much easier conceived without it; if, lastly, both Sceptics and Atheists are for ever silenced upon supposing only spirits and ideas, and this scheme of things is perfectly agreeable both to Reason and Religion: methinks we may expect it should be admitted and firmly embraced, though it were proposed only as an hypothesis, and the existence of Matter had been allowed possible, which yet I think we have evidently demonstrated that it is not.

134. True it is that, in consequence of the foregoing principles, several disputes and speculations which are esteemed no mean parts of learning, are rejected as useless. But, how great a prejudice soever against our notions this may give to those who have already been deeply engaged, and make large advances in studies of that nature, yet by others we hope it will not be thought any just ground of dislike to the principles and tenets herein laid down, that they abridge the labour of study, and make human sciences far more clear, compendious and attainable than they were before.

135. Having despatched what we intended to say concerning the knowledge of IDEAS, the method we proposed leads us in the next place to treat of SPIRITS- with regard to which, perhaps, human knowledge is not so deficient as is vulgarly imagined. The great reason that is assigned for our being thought ignorant of the nature of spirits is our not having an idea of it. But, surely it ought not to be looked on as a defect in a human understanding that it does not perceive the idea of spirit, if it is manifestly impossible there should be any such idea. And this if I mistake not has been demonstrated in section 27; to which I shall here add that a spirit has been shewn to be the only substance or support wherein unthinking beings or ideas can exist; but that this substance which supports or perceives ideas should itself be an idea or like an idea is evidently absurd.

136. It will perhaps be said that we want a sense (as some have imagined) proper to know substances withal, which, if we had, we might know our own soul as we do a triangle. To this I answer, that, in case we had a new sense bestowed upon us, we could only receive thereby some new sensations or ideas of sense. But I believe nobody will say that what he means by the terms soul and substance is only some particular sort of idea or sensation. We may therefore infer that, all things duly considered, it is not more reasonable to think our faculties defective, in that they do not furnish us with an idea of spirit or active thinking substance, than it would be if we should blame them for not being able to comprehend a round square.

137. From the opinion that spirits are to be known after the manner of an idea or sensation have risen many absurd and heterodox tenets, and much scepticism about the nature of the soul. It is even probable that this opinion may have produced a doubt in some whether they had any soul at all distinct from their body since upon inquiry they could not find they had an idea of it. That an idea which is inactive, and the existence whereof consists in being perceived, should be the image or likeness of an agent subsisting by itself, seems to need no other refutation than barely attending to what is meant by those words. But, perhaps you will say that though an idea cannot resemble a spirit in its thinking, acting, or subsisting by itself, yet it may in some other respects; and it is not necessary that an idea or image be in all respects like the original.

138. I answer, if it does not in those mentioned, it is impossible it should represent it in any other thing. Do but leave out the power of willing, thinking, and perceiving ideas, and there remains nothing else wherein the idea can be like a spirit. For, by the word spirit we mean only that which thinks, wills, and perceives; this, and this alone, constitutes the signification of the term. If therefore it is impossible that any degree of those powers should be represented in an idea, it is evident there can be no idea of a spirit.

139. But it will be objected that, if there is no idea signified by the terms soul, spirit, and substance, they are wholly insignificant, or have no meaning in them. I answer,

those words do mean or signify a real thing, which is neither an idea nor like an idea, but that which perceives ideas, and wills, and reasons about them. What I am myself, that which I denote by the term I, is the same with what is meant by soul or spiritual substance. If it be said that this is only quarreling at a word, and that, since the immediately significations of other names are by common consent called ideas, no reason can be assigned why that which is signified by the name spirit or soul may not partake in the same appellation. I answer, all the unthinking objects of the mind agree in that they are entirely passive, and their existence consists only in being perceived; whereas a soul or spirit is an active being, whose existence consists, not in being perceived, but in perceiving ideas and thinking. It is therefore necessary, in order to prevent equivocation and confounding natures perfectly disagreeing and unlike, that we distinguish between spirit and idea. See sect. 27.

140. In a large sense, indeed, we may be said to have an idea or rather a notion of spirit; that is, we understand the meaning of the word, otherwise we could not affirm or deny anything of it. Moreover, as we conceive the ideas that are in the minds of other spirits by means of our own, which we suppose to be resemblances of them; so we know other spirits by means of our own soul- which in that sense is the image or idea of them; it having a like respect to other spirits that blueness or heat by me perceived has to those ideas perceived by another.

141. It must not be supposed that they who assert the natural immortality of the soul are of opinion that it is absolutely incapable of annihilation even by the infinite power of the Creator who first gave it being, but only that it is not liable to be broken or dissolved by the ordinary laws of nature or motion. They indeed who hold the soul of man to be only a thin vital flame, or system of animal spirits, make it perishing and corruptible as the body; since there is nothing more easily dissipated than such a being, which it is naturally impossible should survive the ruin of the tabernacle wherein it is enclosed. And this notion has been greedily embraced and cherished by the worst part of mankind, as the most effectual antidote against all impressions of virtue and religion. But it has been made evident that bodies, of what frame or texture soever, are barely passive ideas in the mind, which is more distant and heterogeneous from them than light is from darkness. We have shewn that the soul is indivisible, incorporeal, unextended, and it is consequently incorruptible. Nothing can be plainer than that the motions, changes, decays, and dissolutions which we hourly see befall natural bodies (and which is what we mean by the course of nature) cannot possibly affect an active, simple, uncompounded substance; such a being therefore is indissoluble by the force of nature; that is to say, "the soul of man is naturally immortal."

142. After what has been said, it is, I suppose, plain that our souls are not to be known in the same manner as senseless, inactive objects, or by way of idea. Spirits and ideas are things so wholly different, that when we say "they exist," "they are known," or the like, these words must not

be thought to signify anything common to both natures. There is nothing alike or common in them: and to expect that by any multiplication or enlargement of our faculties we may be enabled to know a spirit as we do a triangle, seems as absurd as if we should hope to see a sound. This is inculcated because I imagine it may be of moment towards clearing several important questions, and preventing some very dangerous errors concerning the nature of the soul. We may not, I think, strictly be said to have an idea of an active being, or of an action, although we may be said to have a notion of them. I have some knowledge or notion of my mind, and its acts about ideas, inasmuch as I know or understand what is meant by these words. What I know, that I have some notion of. I will not say that the terms idea and notion may not be used convertibly, if the world will have it so; but yet it conduceth to clearness and propriety that we distinguish things very different by different names. It is also to be remarked that, all relations including an act of the mind, we cannot so properly be said to have an idea, but rather a notion of the relations and habitudes between things. But if, in the modern way, the word idea is extended to spirits, and relations, and acts, this is, after all, an affair of verbal concern.

143. It will not be amiss to add, that the doctrine of abstract ideas has had no small share in rendering those sciences intricate and obscure which are particularly conversant about spiritual things. Men have imagined they could frame abstract notions of the powers and acts of the mind, and consider them prescinded as well from the mind or spirit itself, as from their respective objects and effects. Hence a great number of dark and ambiguous terms, presumed to stand for abstract notions, have been introduced into metaphysics and morality, and from these have grown infinite distractions and disputes amongst the learned.

144. But, nothing seems more to have contributed towards engaging men in controversies and mistakes with regard to the nature and operations of the mind, than the being used to speak of those things in terms borrowed from sensible ideas. For example, the will is termed the motion of the soul; this infuses a belief that the mind of man is as a ball in motion, impelled and determined by the objects of sense, as necessarily as that is by the stroke of a racket. Hence arise endless scruples and errors of dangerous consequence in morality. All which, I doubt not, may be cleared, and truth appear plain, uniform, and consistent, could but philosophers be prevailed on to retire into themselves, and attentively consider their own meaning.

145. From what has been said, it is plain that we cannot know the existence of other spirits otherwise than by their operations, or the ideas by them excited in us. I perceive several motions, changes, and combinations of ideas, that inform me there are certain particular agents, like myself, which accompany them and concur in their production. Hence, the knowledge I have of other spirits is not immediate, as is the knowledge of my ideas; but depending on the intervention of ideas, by me referred to agents or spirits distinct from myself, as effects or concomitant signs.

146. But, though there be some things which convince us human agents are concerned in producing them; yet it is evident to every one that those things which are called the Works of Nature, that is, the far greater part of the ideas or sensations perceived by us, are not produced by, or dependent on, the wills of men. There is therefore some other Spirit that causes them; since it is repugnant that they should subsist by themselves. See sect. 29. But, if we attentively consider the constant regularity, order, and concatenation of natural things, the surprising magnificence, beauty, and perfection of the larger, and the exquisite contrivance of the smaller parts of creation, together with the exact harmony and correspondence of the whole, but above all the never-enough-admired laws of pain and pleasure, and the instincts or natural inclinations, appetites, and passions of animals; I say if we consider all these things, and at the same time attend to the meaning and import of the attributes One, Eternal, Infinitely Wise, Good, and Perfect, we shall clearly perceive that they belong to the aforesaid Spirit, "who works all in all," and "by whom all things consist."

147. Hence, it is evident that God is known as certainly and immediately as any other mind or spirit whatsoever distinct from ourselves. We may even assert that the existence of God is far more evidently perceived than the existence of men; because the effects of nature are infinitely more numerous and considerable than those ascribed to human agents. There is not any one mark that denotes a man, or effect produced by him, which does not more strongly evince the being of that Spirit who is the Author of Nature. For, it is evident that in affecting other persons the will of man has no other object than barely the motion of the limbs of his body; but that such a motion should be attended by, or excite any idea in the mind of another, depends wholly on the will of the Creator. He alone it is who, "upholding all things by the word of His power," maintains that intercourse between spirits whereby they are able to perceive the existence of each other. And yet this pure and clear light which enlightens every one is itself invisible.

148. It seems to be a general pretence of the unthinking herd that they cannot see God. Could we but see Him, say they, as we see a man, we should believe that He is, and believing obey His commands. But alas, we need only open our eyes to see the Sovereign Lord of all things, with a more full and clear view than we do any one of our fellow-creatures. Not that I imagine we see God (as some will have it) by a direct and immediate view; or see corporeal things, not by themselves, but by seeing that which represents them in the essence of God, which doctrine is, I must confess, to me incomprehensible. But I shall explain my meaning;- A human spirit or person is not perceived by sense, as not being an idea; when therefore we see the colour, size, figure, and motions of a man, we perceive only certain sensations or ideas excited in our own minds; and these being exhibited to our view in sundry distinct collections, serve to mark out unto us the existence of finite and created spirits like ourselves. Hence it is plain we do not

see a man- if by man is meant that which lives, moves, perceives, and thinks as we do- but only such a certain collection of ideas as directs us to think there is a distinct principle of thought and motion, like to ourselves, accompanying and represented by it. And after the same manner we see God; all the difference is that, whereas some one finite and narrow assemblage of ideas denotes a particular human mind, whithersoever we direct our view, we do at all times and in all places perceive manifest tokens of the Divinity: everything we see, hear, feel, or anywise perceive by sense, being a sign or effect of the power of God; as is our perception of those very motions which are produced by men.

149. It is therefore plain that nothing can be more evident to any one that is capable of the least reflexion than the existence of God, or a Spirit who is intimately present to our minds, producing in them all that variety of ideas or sensations which continually affect us, on whom we have an absolute and entire dependence, in short "in whom we live, and move, and have our being." That the discovery of this great truth, which lies so near and obvious to the mind, should be attained to by the reason of so very few, is a sad instance of the stupidity and inattention of men, who, though they are surrounded with such clear manifestations of the Deity, are yet so little affected by them that they seem, as it were, blinded with excess of light.

150. But you will say, Hath Nature no share in the production of natural things, and must they be all ascribed to the immediate and sole operation of God? I answer, if by Nature is meant only the visible series of effects or sensations imprinted on our minds, according to certain fixed and general laws, then it is plain that Nature, taken in this sense, cannot produce anything at all. But, if by Nature is meant some being distinct from God, as well as from the laws of nature, and things perceived by sense, I must confess that word is to me an empty sound without any intelligible meaning annexed to it. Nature, in this acceptation, is a vain chimera, introduced by those heathens who had not just notions of the omnipresence and infinite perfection of God. But, it is more unaccountable that it should be received among Christians, professing belief in the Holy Scriptures, which constantly ascribe those effects to the immediate hand of God that heathen philosophers are wont to impute to Nature. "The Lord He causeth the vapours to ascend; He maketh lightnings with rain; He bringeth forth the wind out of his treasures." Jerem. 10. 13. "He turneth the shadow of death into the morning, and maketh the day dark with night." Amos, 5. 8. "He visiteth the earth, and maketh it soft with showers: He blesseth the springing thereof, and crowneth the year with His goodness; so that the pastures are clothed with flocks, and the valleys are covered over with corn." See Psalm 65. But, notwithstanding that this is the constant language of Scripture, yet we have I know not what aversion from believing that God concerns Himself so nearly in our affairs. Fain would we suppose Him at a great distance off, and substitute some blind unthinking deputy in His stead, though (if we may believe Saint Paul) "He be not far from every one of us."

151. It will, I doubt not, be objected that the slow and gradual methods observed in the production of natural things do not seem to have for their cause the immediate hand of an Almighty Agent. Besides, monsters, untimely births, fruits blasted in the blossom, rains falling in desert places, miseries incident to human life, and the like, are so many arguments that the whole frame of nature is not immediately actuated and superintended by a Spirit of infinite wisdom and goodness. But the answer to this objection is in a good measure plain from sect. 62; it being visible that the aforesaid methods of nature are absolutely necessary, in order to working by the most simple and general rules, and after a steady and consistent manner; which argues both the wisdom and goodness of God. Such is the artificial contrivance of this mighty machine of nature that, whilst its motions and various phenomena strike on our senses, the hand which actuates the whole is itself unperceivable to men of flesh and blood. "Verily" (saith the prophet) "thou art a God that hidest thyself." Isaiah, 45. 15. But, though the Lord conceal Himself from the eyes of the sensual and lazy, who will not be at the least expense of thought, yet to an unbiased and attentive mind nothing can be more plainly legible than the intimate presence of an All-wise Spirit, who fashions, regulates and sustains the whole system of beings. It is clear, from what we have elsewhere observed, that the operating according to general and stated laws is so necessary for our guidance in the affairs of life, and letting us into the secret of nature, that without it all reach and compass of thought, all human sagacity and design, could serve to no manner of purpose; it were even impossible there should be any such faculties or powers in the mind. See sect. 31. Which one consideration abundantly outbalances whatever particular inconveniences may thence arise.

152. We should further consider that the very blemishes and defects of nature are not without their use, in that they make an agreeable sort of variety, and augment the beauty of the rest of the creation, as shades in a picture serve to set off the brighter and more enlightened parts. We would likewise do well to examine whether our taxing the waste of seeds and embryos, and accidental destruction of plants and animals, before they come to full maturity, as an imprudence in the Author of nature, be not the effect of prejudice contracted by our familiarity with impotent and saving mortals. In man indeed a thrifty management of those things which he cannot procure without much pains and industry may be esteemed wisdom. But, we must not imagine that the inexplicably fine machine of an animal or vegetable costs the great Creator any more pains or trouble in its production than a pebble does; nothing being more evident than that an Omnipotent Spirit can indifferently produce everything by a mere fiat or act of His will. Hence, it is plain that the splendid profusion of natural things should not be interpreted weakness or prodigality in the agent who produces them, but rather be looked on as an argument of the riches of His power.

153. As for the mixture of pain or uneasiness which is in the world, pursuant to the general laws of nature, and the actions of finite, imperfect spirits, this, in the state

we are in at present, is indispensably necessary to our well-being. But our prospects are too narrow. We take, for instance, the idea of some one particular pain into our thoughts, and account it evil; whereas, if we enlarge our view, so as to comprehend the various ends, connexions, and dependencies of things, on what occasions and in what proportions we are affected with pain and pleasure, the nature of human freedom, and the design with which we are put into the world; we shall be forced to acknowledge that those particular things which, considered in themselves, appear to be evil, have the nature of good, when considered as linked with the whole system of beings.

154. From what has been said, it will be manifest to any considering person, that it is merely for want of attention and comprehensiveness of mind that there are any favourers of Atheism or the Manichean Heresy to be found. Little and unreflecting souls may indeed burlesque the works of Providence, the beauty and order whereof they have not capacity, or will not be at the pains, to comprehend; but those who are masters of any justness and extent of thought, and are withal used to reflect, can never sufficiently admire the divine traces of Wisdom and Goodness that shine throughout the Economy of Nature. But what truth is there which shineth so strongly on the mind that by an aversion of thought, a wilful shutting of the eyes, we may not escape seeing it? Is it therefore to be wondered at, if the generality of men, who are ever intent on business or pleasure, and little used to fix or open the eye of their mind, should not have all that conviction and evidence of the Being of God which might be expected in reasonable creatures?

155. We should rather wonder that men can be found so stupid as to neglect, than that neglecting they should be unconvinced of such an evident and momentous truth. And yet it is to be feared that too many of parts and leisure, who live in Christian countries, are, merely through a supine and dreadful negligence, sunk into Atheism. Since it is downright impossible that a soul pierced and enlightened with a thorough sense of the omnipresence, holiness, and justice of that Almighty Spirit should persist in a remorseless violation of His laws. We ought, therefore, earnestly to meditate and dwell on those important points; that so we may attain conviction without all scruple "that the eyes of the Lord are in every place beholding the evil and the good; that He is with us and keepeth us in all places whither we go, and giveth us bread to eat and raiment to put on"; that He is present and conscious to our innermost thoughts; and that we have a most absolute and immediate dependence on Him. A clear view of which great truths cannot choose but fill our hearts with an awful circumspection and holy fear, which is the strongest incentive to Virtue, and the best guard against Vice.

156. For, after all, what deserves the first place in our studies is the consideration of GOD and our DUTY; which to promote, as it was the main drift and design of my labours, so shall I esteem them altogether useless and ineffectual if, by what I have said, I cannot inspire my readers with a pious sense of the Presence of God; and,

having shewn the falseness or vanity of those barren speculations which make the chief employment of learned men, the better dispose them to reverence and embrace the salutary truths of the Gospel, which to know and to practice is the highest perfection of human nature.

The First Dialogue

***Philonous*. Good morrow, Hylas: I did not expect to find you abroad so early.**

***Hylas*. It is indeed something unusual; but my thoughts were so taken up with a subject I was discoursing of last night, that finding I could not sleep, I resolved to rise and take a turn in the garden.**

***Phil*. It happened well, to let you see what innocent and agreeable pleasures you lose every morning. Can there be a pleasanter time of the day, or a more delightful season of the year? That purple sky, those wild but sweet notes of birds, the fragrant bloom upon the trees and flowers, the gentle influence of the rising sun, these and a thousand nameless beauties of nature inspire the soul with secret transports; its faculties too being at this time fresh and lively, are fit for those meditations, which the solitude of a garden and tranquillity of the morning naturally dispose us to. But I am afraid I interrupt your thoughts: for you seemed very intent on something.**

***Hyl*. It is true, I was, and shall be obliged to you if you will permit me to go on in the same vein; not that I would by any means deprive myself of your company, for my thoughts always flow more easily in conversation with a friend, than when I am alone: but my request is, that you would suffer me to impart my reflexions to you.**

***Phil*. With all my heart, it is what I should have requested myself if you had not prevented me.**

***Hyl*. I was considering the odd fate of those men who have in all ages, through an affectation of being distinguished from the vulgar, or some unaccountable turn of thought, pretended either to believe nothing at all, or to believe the most extravagant things in the world. This however might be borne, if their paradoxes and scepticism did not draw after them some consequences of general disadvantage to mankind. But the mischief lieth {172} here; that when men of less leisure see them who are supposed to have spent their whole time in the pursuits of knowledge professing an entire ignorance of all things, or advancing such notions as are repugnant to plain and commonly received principles, they will be tempted to entertain suspicions concerning the most important truths, which they had hitherto held sacred and unquestionable.**

***Phil*. I entirely agree with you, as to the ill tendency of the affected doubts of some philosophers, and fantastical conceits of others. I am even so far gone of late in this way of thinking, that I have quitted several of the sublime notions I had got in their schools for vulgar opinions. And I give it you on my word; since this revolt from metaphysical notions to the plain dictates of nature and common sense, I find my understanding strangely enlightened, so that I can now easily comprehend a great many things which before were all mystery and riddle.**

***Hyl*. I am glad to find there was nothing in the accounts I heard of you.**

***Phil*. Pray, what were those?**

***Hyl*. You were represented, in last night's conversation, as one who maintained the most extravagant opinion that ever entered into the mind of man, to wit, that there is no such thing as *material substance* in the world.**

***Phil*. That there is no such thing as what *philosophers call material substance*, I am seriously persuaded: but, if I were made to see anything absurd or sceptical in this, I should then have the same reason to renounce this that I imagine I have now to reject the contrary opinion.**

***Hyl*. What I can anything be more fantastical, more repugnant to Common Sense, or a more manifest piece of Scepticism, than to believe there is no such thing as *matter*?**

***Phil*. Softly, good Hylas. What if it should prove that you, who hold there is, are, by virtue of that opinion, a greater sceptic, and maintain more paradoxes and repugnances to Common Sense, than I who believe no such thing?**

***Hyl*. You may as soon persuade me, the part is greater than the whole, as that, in order to avoid absurdity and Scepticism, I should ever be obliged to give up my opinion in this point.**

***Phil*. Well then, are you content to admit that opinion for true, which upon examination shall appear most agreeable to Common Sense, and remote from Scepticism?**

***Hyl*. With all my heart. Since you are for raising disputes {173} about the plainest things in nature, I am content for once to hear what you have to say.**

***Phil*. Pray, Hylas, what do you mean by a *sceptic*?**

***Hyl*. I mean what all men mean -- one that doubts of everything.**

***Phil*. He then who entertains no doubts concerning some particular point, with regard to that point cannot be thought a sceptic.**

***Hyl*. I agree with you.**

***Phil*. Whether doth doubting consist in embracing the affirmative or negative side of a question?**

***Hyl*. In neither; for whoever understands English cannot but know that *doubting* signifies a suspense between both.**

***Phil*. He then that denies any point, can no more be said to doubt of it, than he who affirmeth it with the same degree of assurance.**

***Hyl*. True.**

***Phil*. And, consequently, for such his denial is no more to be esteemed a sceptic than the other.**

***Hyl*. I acknowledge it.**

***Phil*. How cometh it to pass then, Hylas, that you pronounce me *a sceptic*, because I deny what you affirm, to wit, the existence of Matter? Since, for aught you can tell, I am as peremptory in my denial, as you in your affirmation.**

***Hyl*. Hold, Philonous, I have been a little out in my definition; but every false step a man makes in discourse is not to be insisted on. I said indeed that a *sceptic* was one who doubted of everything; but I should have added, or who denies the reality and truth of things.**

***Phil*. What things? Do you mean the principles and theorems of sciences? But these you know are universal intellectual notions, and consequently independent of Matter. The denial therefore of this doth not imply the denying them.**

***Hyl*. I grant it. But are there no other things? What think you of distrusting the senses, of denying the real existence of sensible things, or pretending to know nothing of them. Is not this sufficient to**

denominate a man a *sceptic*?

***Phil*. Shall we therefore examine which of us it is that denies the reality of sensible things, or professes the greatest ignorance of them; since, if I take you rightly, he is to be {174} esteemed the greatest *sceptic*?**

***Hyl*. That is what I desire.**

***Phil*. What mean you by Sensible Things?**

***Hyl*. Those things which are perceived by the senses. Can you imagine that I mean anything else?**

***Phil*. Pardon me, Hylas, if I am desirous clearly to apprehend your notions, since this may much shorten our inquiry. Suffer me then to ask you this farther question. Are those things only perceived by the senses which are perceived immediately? Or, may those things properly be said to be *sensible* which are perceived mediately, or not without the intervention of others?**

***Hyl*. I do not sufficiently understand you.**

***Phil*. In reading a book, what I immediately perceive are the letters; but mediately, or by means of these, are suggested to my mind the notions of God, virtue, truth, &c. Now, that the letters are truly sensible things, or perceived by sense, there is no doubt: but I would know whether you take the things suggested by them to be so too.**

***Hyl*. No, certainly: it were absurd to think *God* or *virtue* sensible things; though they may be signified and suggested to the mind by sensible marks, with which they have an arbitrary connexion.**

***Phil*. It seems then, that by *sensible things* you mean those only which can be perceived *immediately* by sense?**

***Hyl*. Right.**

***Phil*. Doth it not follow from this, that though I see one part of the sky red, and another blue, and that my reason doth thence evidently conclude there must be some cause of that diversity of colours, yet that cause cannot be said to be a sensible thing, or perceived by the sense of seeing?**

***Hyl*. It doth.**

***Phil*. In like manner, though I hear variety of sounds, yet I cannot be said to hear the causes of those sounds?**

***Hyl*. You cannot.**

***Phil*. And when by my touch I perceive a thing to be hot and heavy, I cannot say, with any truth or propriety, that I feel the cause of its heat or weight?**

***Hyl*. To prevent any more questions of this kind, I tell you once for all, that by *sensible things* I mean those only which are perceived by sense; and that in truth the senses perceive nothing which they do not perceive *immediately*: for they make no {175} inferences. The deducing therefore of causes or occasions from effects and appearances, which alone are perceived by sense, entirely relates to reason.**

***Phil*. This point then is agreed between us -- That *sensible things are those only which are immediately perceived by sense*. You will farther inform me, whether we immediately perceive by sight anything beside light, and colours, and figures; or by hearing, anything but sounds; by the palate, anything beside tastes; by the smell, beside odours; or by the touch, more than tangible qualities.**

***Hyl*. We do not.**

***Phil*. It seems, therefore, that if you take away all sensible qualities, there remains nothing sensible?**

***Hyl*. I grant it.**

***Phil*. Sensible things therefore are {250} nothing else but so many sensible qualities, or combinations of sensible qualities?**

***Hyl*. Nothing else.**

***Phil*. *Heat* then is a sensible thing?**

***Hyl*. Certainly.**

***Phil*. Doth the *reality* of sensible things consist in being perceived? or, is it something distinct from their being perceived, and that bears no relation to the mind?**

***Hyl*. To *exist* is one thing, and to be *perceived* is another.**

***Phil*. I speak with regard to sensible things only. And of these I ask, whether by their real existence you mean a subsistence exterior to the mind, and distinct from their being perceived?**

***Hyl*. I mean a real absolute being, distinct from, and without any relation to, their being perceived.**

***Phil*. Heat therefore, if it be allowed a real being, must exist without the mind?**

***Hyl*. It must.**

***Phil*. Tell me, Hylas, is this real existence equally compatible to all degrees of heat, which we perceive; or is there any reason why we should attribute it to some, and deny it to others? And if there be, pray let me know that reason.**

***Hyl*. Whatever degree of heat we perceive by sense, we may be sure the same exists in the object that occasions it.**

***Phil*. What! the greatest as well as the least?**

***Hyl*. *I* tell you, the reason is plainly the same in respect of both. They are both perceived by sense; nay, the greater degree of heat is more sensibly perceived; and consequently, if there is {176} any difference, we are more certain of its real existence than we can be of the reality of a lesser degree.**

***Phil*. But is not the most vehement and intense degree of heat a very great pain?**

***Hyl*. No one can deny it.**

***Phil*. And is any unperceiving thing capable of pain or pleasure?**

***Hyl*. No, certainly.**

***Phil*. Is your material substance a senseless being, or a being endowed with sense and perception?**

***Hyl*. It is senseless without doubt.**

***Phil*. It cannot therefore be the subject of pain?**

***Hyl*. By no means.**

***Phil*. Nor consequently of the greatest heat perceived by sense, since you acknowledge this to be no small pain?**

***Hyl*. I grant it.**

***Phil*. What shall we say then of your external object; is it a material Substance, or no?**

***Hyl*. It is a material substance with the sensible qualities inhering in it.**

***Phil*. How then can a great heat exist in it, since you own it cannot in a material substance? I desire you would clear this point.**

***Hyl*. Hold, Philonous, I fear I was out in yielding intense heat to be a pain. It should seem rather, that pain is something distinct from heat, and the consequence or effect of it.**

***Phil*. Upon putting your hand near the fire, do you perceive one simple uniform sensation, or two distinct sensations?**

***Hyl*. But one simple sensation.**

***Phil*. Is not the heat immediately perceived?,**

***Hyl*. It is.**

***Phil*. And the pain?**

***Hyl*. True.**

***Phil*. Seeing therefore they are both immediately perceived at the same time, and the fire affects you only with one simple or uncompounded idea, it follows that this same simple idea is both the intense heat immediately perceived, and the pain; and, consequently, that the intense heat immediately perceived is nothing distinct from a particular sort of pain.**

***Hyl*. It seems so.**

***Phil*. Again, try in your thoughts, Hylas, if you can conceive a vehement sensation to be without pain or pleasure. {177}**

***Hyl*. I cannot.**

***Phil*. Or can you frame to yourself an idea of sensible pain or pleasure in general, abstracted from every particular idea of heat, cold, tastes, smells? &c.**

***Hyl*. I do not find that I can.**

***Phil*. Doth it not therefore follow, that sensible pain is nothing distinct from those sensations or ideas, in an intense degree?**

***Hyl*. It is undeniable; and, to speak the truth, I begin to suspect a very great heat cannot exist but in a mind perceiving it.**

***Phil*. What! are you then in that sceptical state of suspense, between affirming and denying?**

***Hyl*. I think I may be positive in the point. A very violent and painful heat cannot exist without the mind.**

***Phil*. It hath not therefore according to you, any *real* being?**

***Hyl*. I own it.**

***Phil*. Is it therefore certain, that there is no body in nature really hot?**

***Hyl*. I have not denied there is any real heat in bodies. I only say, there is no such thing as an intense real heat.**

***Phil*. But, did you not say before that all degrees of heat were equally real; or, if there was any difference, that the greater were more undoubtedly real than the lesser?**

***Hyl*. True: but it was because I did not then consider the ground there is for distinguishing between them, which I now plainly see. And it is this: because intense heat is nothing else but a particular kind of painful sensation; and pain cannot exist but in a perceiving being; it follows that no intense heat can really exist in an unperceiving corporeal substance. But this is no reason wh' we should**

deny heat in an inferior degree to exist in such a substance.

***Phil*. But how shall we be able to discern those degrees of heat which exist only in the mind from those which exist without it?**

***Hyl*. That is no difficult matter. You know the least pain cannot exist unperceived; whatever, therefore, degree of heat is a pain exists only in the mind. But, as for all other degrees of heat, nothing obliges us to think the same of them.**

***Phil*. I think you granted before that no unperceiving being was capable of pleasure, any more than of pain.**

***Hyl*. I did. {178}**

***Phil*. And is not warmth, or a more gentle degree of heat than what causes uneasiness, a pleasure?**

***Hyl*. What then?**

***Phil*. Consequently, it cannot exist without the mind in an unperceiving substance, or body.**

***Hyl*. So it seems.**

***Phil*. Since, therefore, as well those degrees of heat that are not painful, as those that are, can exist only in a thinking substance; may we not conclude that external bodies are absolutely incapable of any degree of heat whatsoever?**

***Hyl*. On second thoughts, I do not think it so evident that warmth is a pleasure as that a great degree of heat is a pain.**

***Phil*. *I* do not pretend that warmth is as great a pleasure as heat is a pain. But, if you grant it to be even a small pleasure, it serves to make good my conclusion.**

***Hyl*. I could rather call it an *indolence*. It seems to be nothing more than a privation of both pain and pleasure. And that such a quality or state as this may agree to an unthinking substance, I hope you will not deny.**

***Phil*. If you are resolved to maintain that warmth, or a gentle degree of heat, is no pleasure, I know not how to convince you otherwise than by appealing to your own sense. But what think you of cold?**

***Hyl*. The same that I do of heat. An intense degree of cold is a pain; for to feel a very great cold, is to perceive a great uneasiness: it cannot therefore exist without the mind; but a lesser degree of cold may, as well as a lesser degree of heat.**

***Phil*. Those bodies, therefore, upon whose application to our own, we perceive a moderate degree of heat, must be concluded to have a moderate degree of heat or warmth in them; and those, upon whose application we feel a like degree of cold, must be thought to have cold in them.**

***Hyl*. They must.**

***Phil*. Can any doctrine be true that necessarily leads a man into an absurdity?**

***Hyl*. Without doubt it cannot.**

***Phil*. Is it not an absurdity to think that the same thing should be at the same time both cold and warm?**

***Hyl*. It is.**

***Phil*. Suppose now one of your hands hot, and the other cold, and that they are both at once put into the same vessel of {179} water, in an intermediate state; will not the water seem cold to one**

hand, and warm to the other?

***Hyl*. It will.**

***Phil*. Ought we not therefore, by your principles, to conclude it is really both cold and warm at the same time, that is, according to your own concession, to believe an absurdity?**

***Hyl*. I confess it seems so.**

***Phil*. Consequently, the principles themselves are false, since you have granted that no true principle leads to an absurdity.**

***Hyl*. But, after all, can anything be more absurd than to say, *there is no heat in the fire*?**

***Phil*. To make the point still clearer; tell me whether, in two cases exactly alike, we ought not to make the same judgment?**

.*Hyl*. We ought.

***Phil*. When a pin pricks your finger, doth it not rend and divide the fibres of your flesh?**

***Hyl*. It doth.**

***Phil*. And when a coal burns your finger, doth it any more?**

***Hyl*. It doth not.**

***Phil*. Since, therefore, you neither judge the sensation itself occasioned by the pin, nor anything like it to be in the pin; you should not, conformably to what you have now granted, judge the sensation occasioned by the fire, or anything like it, to be in the fire.**

***Hyl*. Well, since it must be so, I am content to yield this point, and acknowledge that heat and cold are only sensations existing in our minds. But there still remain qualities enough to secure the reality of external things.**

***Phil*. But what will you say, Hylas, if it shall appear that the case is the same with regard to all other sensible qualities, and that they can no more be supposed to exist without the mind, than heat and cold?**

***Hyl*. Then indeed you will have done something to the purpose; but that is what I despair of seeing proved.**

***Phil*. Let us examine them in order. What think you of *tastes*, do they exist without the mind, or no?**

***Hyl*. Can any man in his senses doubt whether sugar is sweet, or wormwood bitter?**

***Phil*. Inform me, Hylas. Is a sweet taste a particular kind of pleasure or pleasant sensation, or is it not? {180}**

***Hyl*. It is.**

***Phil*. And is not bitterness some kind of uneasiness or pain?**

***Hyl*. I grant it.**

***Phil*. If therefore sugar and wormwood are unthinking corporeal substances existing without the mind, how can sweetness and bitterness, that is, Pleasure and pain, agree to them?**

***Hyl*. Hold, Philonous, I now see what it was delude time. You asked whether heat and cold, sweetness at were not particular sorts of pleasure and pain; to which simply, that they were. Whereas I should have thus distinguished: those qualities, as perceived by us, are pleasures or pair existing in the external objects. We must not therefore conclude absolutely, that there is no heat in**

the fire, or sweetness in the sugar, but only that heat or sweetness, as perceived by us, are not in the fire or sugar. What say you to this?

***Phil*. I say it is nothing to the purpose. Our discourse proceeded altogether concerning sensible things, which you defined to be, *the things we immediately perceive by our senses*. Whatever other qualities, therefore, you speak of as distinct from these, I know nothing of them, neither do they at all belong to the point in dispute. You may, indeed, pretend to have discovered certain qualities which you do not perceive, and assert those insensible qualities exist in fire and sugar. But what use can be made of this to your present purpose, I am at a loss to conceive. Tell me then once more, do you acknowledge that heat and cold, sweetness and bitterness (meaning those qualities which are perceived by the senses), do not exist without the mind?**

***Hyl*. I see it is to no purpose to hold out, so I give up the cause as to those mentioned qualities. Though I profess it sounds oddly, to say that sugar is not sweet.**

***Phil*. But, for your farther satisfaction, take this along with you: that which at other times seems sweet, shall, to a distempered palate, appear bitter. And, nothing can be plainer than that divers persons perceive different tastes in the same food; since that which one man delights in, another abhors. And how could this be, if the taste was something really inherent in the food?**

***Hyl*. I acknowledge I know not how.**

***Phil*. In the next place, *odours* are to be considered. And, with regard to these, I would fain know whether what hath {181} been said of tastes doth not exactly agree to them? Are they not so many pleasing or displeasing sensations?**

***Hyl*. They are.**

***Phil*. Can you then conceive it possible that they should exist in an unperceiving thing?**

***Hyl*. I cannot.**

***Phil*. Or, can you imagine that filth and ordure affect those brute animals that feed on them out of choice, with the same smells which we perceive in them?**

***Hyl*. By no means.**

***Phil*. May we not therefore conclude of smells, as of the other forementioned qualities, that they cannot exist in any but a perceiving substance or mind?**

***Hyl*. I think so.**

***Phil*. Then as to *sounds*, what must we think of them: are they accidents really inherent in external bodies, or not?**

***Hyl*. That they inhere not in the sonorous bodies is plain from hence: because a bell struck in the exhausted receiver of an air-pump sends forth no sound. The air, therefore, must be thought the subject of sound.**

***Phil*. What reason is there for that, Hylas?**

***Hyl*. Because, when any motion is raised in the air, we perceive a sound greater or lesser, according to the air's motion; but without some motion in the air, we never hear any sound at all.**

***Phil*. And granting that we never hear a sound but when some motion is produced in the air, yet I do not see how you can infer from thence, that the sound itself is in the air.**

***Hyl*. It is this very motion in the external air that produces in the mind the sensation of *sound*. For, striking on the drum of the ear, it causeth a vibration, which by the auditory nerves being**

communicated to the brain, the soul is thereupon affected with the sensation called *sound*.

***Phil*. What! is sound then a sensation?**

***Hyl*. I tell you, as perceived by us, it is a particular sensation in the mind.**

***Phil*. And can any sensation exist without the mind?**

***Hyl*. No, certainly.**

***Phil*. How then can sound, being a sensation, exist in the air, if by the *air* you mean a senseless substance existing without the mind?**

***Hyl*. You must distinguish, Philonous, between sound as it is {182} perceived by us, and as it is in itself; or (which is the same thing) between the sound we immediately perceive, and that which exists without us. The former, indeed, is a particular kind of sensation, but the latter is merely a vibrative or undulatory motion the air.**

***Phil*. I thought I had already obviated that distinction, by answer I gave when you were applying it in a like case before. But, to say no more of that, are you sure then that sound is really nothing but motion?**

***Hyl*. I am.**

***Phil*. Whatever therefore agrees to real sound, may with truth be attributed to motion?**

***Hyl*. It may.**

***Phil*. It is then good sense to speak of *motion* as of a thing that is *loud, sweet, acute, or grave*.**

***Hyl*. *I* see you are resolved not to understand me. Is it not evident those accidents or modes belong only to sensible sound, or *sound in* the common acceptation of the word, but not to *sound* in the real and philosophic sense; which, as I just now told you, is nothing but a certain motion of the air?**

***Phil*. It seems then there are two sorts of sound -- the one vulgar, or that which is heard, the other philosophical and real?**

***Hyl*. Even so.**

***Phil*. And the latter consists in motion?**

***Hyl*. I told you so before.**

***Phil*. Tell me, Hylas, to which of the senses, think you, the idea of motion belongs? to the hearing?**

***Hyl*. No, certainly; but to the sight and touch.**

***Phil*. It should follow then, that, according to you, real sounds may possibly be *seen or felt*, but never *heard*.**

***Hyl*. Look you, Philonous, you may, if you please, make a jest of my opinion, but that will not alter the truth of things. I own, indeed, the inferences you draw me into sound something oddly; but common language, you know, is framed by, and for the use of the vulgar: we must not therefore wonder if expressions adapted to exact philosophic notions seem uncouth and out of the way.**

***Phil*. Is it come to that? I assure you, I imagine myself to have gained no small point, since you make so light of departing from common phrases and opinions; it being a main part of our inquiry, to examine whose notions are widest of the {183} common road, and most repugnant to the general sense of the world. But, can you think it no more than a philosophical paradox, to say that *real sounds are never heard*, and that the idea of them is obtained by some other sense? And is there nothing in this contrary to nature and the truth of things?**

***Hyl*. To deal ingenuously, I do not like it. And, after the concessions already made, I had as well grant that sounds too have no real being without the mind.**

***Phil*. And I hope you will make no difficulty to acknowledge the same of *colours*.**

***Hyl*. Pardon me: the case of colours is very different. Can anything be plainer than that we see them on the objects?**

***Phil*. The objects you speak of are, I suppose, corporeal Substances existing without the mind?**

***Hyl*. They are.**

***Phil*. And have true and real colours inhering in them?**

***Hyl*. Each visible object hath that colour which we see in it.**

***Phil*. How! is there anything visible but what we perceive by sight?**

***Hyl*. There is not.**

***Phil*. And, do we perceive anything by sense which we do not perceive immediately?**

***Hyl*. How often must I be obliged to repeat the same thing? I tell you, we do not.**

***Phil*. Have patience, good Hylas; and tell me once more, whether there is anything immediately perceived by the senses, except sensible qualities. I know you asserted there was not; but I would now be informed, whether you still persist in the same opinion.**

***Hyl*. I do.**

***Phil*. Pray, is your corporeal substance either a sensible quality, or made up of sensible qualities?**

***Hyl*. What a question that is! who ever thought it was?**

***Phil*. My reason for asking was, because in saying, *each visible object hath that colour which we see in it*, you make visible objects to be corporeal substances; which implies either that corporeal substances are sensible qualities, or else that there is something besides sensible qualities perceived by sight: but, as this point was formerly agreed between us, and is still maintained by you, it is a clear consequence, that your *corporeal substance* is nothing distinct from *sensible qualities*. {184}**

***Hyl*. You may draw as many absurd consequences as you please, and endeavour to perplex the plainest things; but you shall never persuade me out of my senses. I clearly understand my own meaning.**

***Phil*. I wish you would make me understand it too. But, since you are unwilling to have your notion of corporeal substance examined, I shall urge that point no farther. Only be pleased to let me know, whether the same colours which we see exist in external bodies, or some other.**

***Hyl*. The very same.**

***Phil*. What! are then the beautiful red and purple we see on yonder clouds really in them? Or do you imagine they have in themselves any other form than that of a dark mist or vapour?**

***Hyl*. I must own, Philonous, those colours are not really in the clouds as they seem to be at this distance. They are only apparent colours.**

***Phil*. *Apparent* call you them? how shall we distinguish these apparent colours from real?**

***Hyl*. Very easily. Those are to be thought apparent which, appearing only at a distance, vanish upon a nearer approach.**

***Phil*. And those, I suppose, are to be thought real which are discovered by the most near and exact survey.**

***Hyl*. Right.**

***Phil*. Is the nearest and exactest survey made by the help of a microscope, or by the naked eye?**

***Hyl*. By a microscope, doubtless.**

***Phil*. But a microscope often discovers colours in an object different from those perceived by the unassisted sight. And, in case we had microscopes magnifying to any assigned degree, it is certain that no object whatsoever, viewed through them, would appear in the same colour which it exhibits to the naked eye.**

***Hyl*. And what will you conclude from all this? You cannot argue that there are really and naturally no colours on objects: because by artificial managements they may be altered, or made to vanish.**

***Phil*. I think it may evidently be concluded from your own concessions, that all the colours we see with our naked eyes are only apparent as those on the clouds, since they vanish upon a more close and accurate inspection which is afforded us by a microscope. Then' as to what you say by way of prevention: {185} I ask you whether the real and natural state of an object is better discovered by a very sharp and piercing sight, or by one which is less sharp?**

***Hyl*. By the former without doubt.**

***Phil*. Is it not plain from *Dioptrics* that microscopes make the sight more penetrating, and represent objects as they would appear to the eye in case it were naturally endowed with a most exquisite sharpness?**

***Hyl*. It is.**

***Phil*. Consequently the microscopical representation is to be thought that which best sets forth the real nature of the thing, or what it is in itself. The colours, therefore, by it perceived are more genuine and real than those perceived otherwise.**

***Hyl*. I confess there is something in what you say.**

***Phil*. Besides, it is not only possible but manifest, that there actually are animals whose eyes are by nature framed to perceive those things which by reason of their minuteness escape our sight. What think you of those inconceivably small animals perceived by glasses? must we suppose they are all stark blind? Or, in case they see, can it be imagined their sight hath not the same use in preserving their bodies from injuries, which appears in that of all other animals? And if it hath, is it not evident they must see particles less than their own bodies; which will present them with a far different view in each object from that which strikes our senses? Even our own eyes do not always represent objects to us after the same manner. In the jaundice every one knows that all things seem yellow. Is it not therefore highly probable those animals in whose eyes we discern a very different texture from that of ours, and whose bodies abound with different humours, do not see the same colours in every object that we do? From all which, should it not seem to follow that all colours are equally apparent, and that none of those which we perceive are really inherent in any outward object?**

***Hyl*. It should.**

***Phil*. The point will be past all doubt, if you consider that, in case colours were real properties or affections inherent in external bodies, they could admit of no alteration without some change wrought in the very bodies themselves: but, is it not evident from what hath been said that, upon the use of microscopes, upon a change happening in the burnouts of the eye, or a variation of**

distance, without any manner of real alteration {186} in the thing itself, the colours of any object are either changed, or totally disappear? Nay, all other circumstances remaining the same, change but the situation of some objects, and they shall present different colours to the eye. The same thing happens upon viewing an object in various degrees of light. And what is more known than that the same bodies appear differently coloured by candle-light from what they do in the open day? Add to these the experiment of a prism which, separating the heterogeneous rays of light, alters the colour of any object, and will cause the whitest to appear of a deep blue or red to the naked eye. And now tell me whether you are still of opinion that every body hath its true real colour inhering in it; and, if you think it hath, I would fain know farther from you, what certain distance and position of the object, what peculiar texture and formation of the eye, what degree or kind of light is necessary for ascertaining that true colour, and distinguishing it from apparent ones.

***Hyl*. I own myself entirely satisfied, that they are all equally apparent, and that there is no such thing as colour really inhering in external bodies, but that it is altogether in the light. And what confirms me in this opinion is, that in proportion to the light colours are still more or less vivid; and if there be no light, then are there no colours perceived. Besides, allowing there are colours on external objects, yet, how is it possible for us to perceive them? For no external body affects the mind, unless it acts first on our organs of sense. But the only action of bodies is motion; and motion cannot be communicated otherwise than by impulse. A distant object therefore cannot act on the eye; nor consequently make itself or its properties perceivable to the soul. Whence it plainly follows that it is immediately some contiguous substance, which, operating on the eye, occasions a perception of colours: and such is light.**

***Phil*. Howl is light then a substance?**

***Hyl*.. I tell you, Philonous, external light is nothing but a thin fluid substance, whose minute particles being agitated with a brisk motion, and in various manners reflected from the different surfaces of outward objects to the eyes, communicate different motions to the optic nerves; which, being propagated to the brain, cause therein various impressions; and these are attended with the sensations of red, blue, yellow, &c.**

***Phil*. It seems then the light doth no more than shake the optic nerves. {187}**

***Hyl*. Nothing else.**

***Phil*. And consequent to each particular motion of the nerves, the mind is affected with a sensation, which is some particular colour.**

***Hyl*. Right.**

***Phil*. And these sensations have no existence without the mind.**

***Hyl*. They have not.**

***Phil*. How then do you affirm that colours are in the light; since by *light* you understand a corporeal substance external to the mind?**

***Hyl*. Light and colours, as immediately perceived by us, I grant cannot exist without the mind. But in themselves they are only the motions and configurations of certain insensible particles of matter.**

***Phil*. Colours then, in the vulgar sense, or taken for the immediate objects of sight, cannot agree to any but a perceiving substance.**

***Hyl*. That is what I say.**

***Phil*. Well then, since you give up the point as to those sensible qualities which are alone thought colours by all mankind beside, you may hold what you please with regard to those invisible ones of the philosophers. It is not my business to dispute about *them*; only I would advise you to bethink yourself, whether, considering the inquiry we are upon, it be prudent for you to affirm -- *the red and blue which we see are not real colours, but certain unknown motions and figures which no man ever did or can see are truly so*. Are not these shocking notions, and are not they subject to as many ridiculous inferences, as those you were obliged to renounce before in the case of sounds?**

***Hyl*. I frankly own, Philonous, that it is in vain to longer. Colours, sounds, tastes, in a word all those termed *secondary qualities*, have certainly no existence without the mind. But by this acknowledgment I must not be supposed to derogate, the reality of Matter, or external objects; seeing it is no more than several philosophers maintain, who nevertheless are the farthest imaginable from denying Matter. For the clearer understanding of this, you must know sensible qualities are by philosophers divided into *Primary* and *Secondary*. The former are Extension, Figure, Solidity, Gravity, Motion, and Rest; {188} and these they hold exist really in bodies. The latter are those above enumerated; or, briefly, *all sensible qualities beside the Primary*; which they assert are only so many sensations or ideas existing nowhere but in the mind. But all this, I doubt not, you are apprised of. For my part, I have been a long time sensible there was such an opinion current among philosophers, but was never thoroughly convinced of its truth until now.**

***Phil*. You are still then of opinion that *extension* and *figures are* inherent in external unthinking substances?**

***Hyl*. I am.**

***Phil*. But what if the same arguments which are brought against Secondary Qualities will hold good against these also?**

***Hyl*. Why then I shall be obliged to think, they too exist only in the mind.**

***Phil*. Is it your opinion the very figure and extension which you perceive by sense exist in the outward object or material substance?**

***Hyl*. It is.**

***Phil*. Have all other animals as good grounds to think the same of the figure and extension which they see and feel?**

***Hyl*. Without doubt, if they have any thought at all.**

***Phil*. Answer me, Hylas. Think you the senses were bestowed upon all animals for their preservation and well-being in life? or were they given to men alone for this end?**

***Hyl*. I make no question but they have the same use in all other animals.**

***Phil*. If so, is it not necessary they should be enabled by them to perceive their own limbs, and those bodies which are capable of harming them?**

***Hyl*. Certainly.**

***Phil*. A mite therefore must be supposed to see his own foot, and things equal or even less than it, as bodies of some considerable dimension; though at the same time they appear to you scarce discernible, or at best as so many visible points?**

***Hyl*. I cannot deny it.**

***Phil*. And to creatures less than the mite they will seem yet larger?**

***Hyl*. They will.**

***Phil*. Insomuch that what you can hardly discern will to another extremely minute animal appear as some huge mountain? {189}**

***Hyl*. All this I grant.**

***Phil*. Can one and the same thing be at the same time in itself of different dimensions?**

***Hyl*. That were absurd to imagine.**

***Phil*. But, from what you have laid down it follows that both the extension by you perceived, and that perceived by the mite itself, as likewise all those perceived by lesser animals, are each of them the true extension of the mite's foot; that is to say, by your own principles you are led into an absurdity.**

***Hyl*. There seems to be some difficulty in the point.**

***Phil*. Again, have you not acknowledged that no real inherent property of any object can be changed without some change in the thing itself?**

***Hyl*. I have.**

***Phil*. But, as we approach to or recede from an object, the visible extension varies, being at one distance ten or a hundred times greater than another. Doth it not therefore follow from hence likewise that it is not really inherent in the object?**

***Hyl*. I own I am at a loss what to think.**

***Phil*. Your judgment will soon be determined, if you will venture to think as freely concerning this quality as you have done concerning the rest. Was it not admitted as a good argument, that neither heat nor cold was in the water, because it seemed warm to one hand and cold to the other?**

***Hyl*. It was.**

***Phil*. Is it not the very same reasoning to conclude, there is no extension or figure in an object, because to one eye it shall seem little, smooth, and round, when at the same time it appears to the other, great, uneven, and regular?**

***Hyl*. The very same. But does this latter fact ever happen?**

***Phil*. You may at any time make the experiment, by looking with one eye bare, and with the other through a microscope.**

***Hyl*. I know not how to maintain it; and yet I am loath to give up *extension*, I see so many odd consequences following upon such a concession.**

***Phil*. Odd, say you? After the concessions already made, I hope you will stick at nothing for its oddness. [But, on the other hand, should it not seem very odd, if the general reasoning {190} which includes all other sensible qualities did not also include extension? If it be allowed that no idea, nor anything like an idea, can exist in an unperceiving substance, then surely it follows that no figure, or mode of extension, which we can either perceive, or imagine, or have any idea of, can be really inherent in Matter; not to mention the peculiar difficulty there must be in conceiving a material substance, prior to and distinct from extension to be the *substratum* of extension. Be the sensible quality what it will -- figure, or sound, or colour, it seems alike impossible it should subsist in that which doth not perceive it.][2]**

***Hyl*. I give up the point for the present, reserving still a right to retract my opinion, in case I shall hereafter discover any false step in my progress to it.**

Phil. That is a right you cannot be denied. Figures and extension being despatched, we proceed next to *motion*. Can a real motion in any external body be at the same time very swift and very slow?

Hyl. It cannot.

Phil. Is not the motion of a body swift in a reciprocal proportion to the time it takes up in describing any given space? Thus a body that describes a mile in an hour moves three times faster than it would in case it described only a mile in three hours.

Hyl. I agree with you.

Phil. And is not time measured by the succession of ideas in our minds?

Hyl. It is.

Phil. And is it not possible ideas should succeed one another twice as fast in your mind as they do in mine, or in that of some spirit of another kind?

Hyl. I own it.

Phil. Consequently the same body may to another seem to perform its motion over any space in half the time that it doth to you. And the same reasoning will hold as to any other proportion: that is to say, according to your principles (since the motions perceived are both really in the object) it is possible one and the same body shall be really moved the same way at once, both very swift and very slow. How is this consistent either with common sense, or with what you just now granted? {191}

Hyl. I have nothing to say to it.

Phil. Then as for *solidity*; either you do not mean any sensible quality by that word, and so it is beside our inquiry: or if you do, it must be either hardness or resistance. But both the one and the other are plainly relative to our senses: it being evident that what seems hard to one animal may appear soft to another, who hath greater force and firmness of limbs. Nor is it less plain that the resistance I feel is not in the body.

Hyl. I own the very *sensation* of resistance, which is all you immediately perceive, is not in the body; but the *cause* of that sensation is.

Phil. But the causes of our sensations are not things immediately perceived, and therefore are not sensible. This point I thought had been already determined.

Hyl. I own it was; but you will pardon me if I seem a little embarrassed: I know not how to quit my old notions.

Phil. To help you out, do but consider that if *extension* be once acknowledged to have no existence without the mind, the same must necessarily be granted of motion, solidity, and gravity; since they all evidently suppose extension. It is therefore superfluous to inquire particularly concerning each of them. In denying extension, you have denied them all to have any real existence.

Hyl. I wonder, Philonous, if what you say be true, why those philosophers who deny the Secondary Qualities any real existence should yet attribute it to the Primary. If there is no difference between them, how can this be accounted for?

Phil. It is not my business to account for every opinion of the philosophers. But, among other reasons which may be assigned for this, it seems probable that pleasure and pain being rather annexed to the former than the latter may be one. Heat and cold, tastes and smells, have something more vividly pleasing or disagreeable than the ideas of extension, figure, and motion affect us with.

And, it being too visibly absurd to hold that pain or pleasure can be in an unperceiving substance, men are more easily weaned from believing the external existence of the Secondary than the Primary Qualities. You will be satisfied there is something in this, if you recollect the difference you made between an intense and more moderate degree of heat; allowing the one a real existence, while you denied it to the other. But, after all, there is no rational ground for that distinction; for, surely an indifferent sensation is as {191} truly *a sensation* as one more pleasing or painful; and consequently should not any more than they be supposed to exist in an unthinking subject.

Hyl. It is just come into my head, Philonous, that I have somewhere heard of a distinction between absolute and sensible extension. Now, though it be acknowledged that *great* and *small*, consisting merely in the relation which other extended beings have to the parts of our own bodies, do not really inhere in the substances themselves; yet nothing obliges us to hold the same with regard to *absolute extension*, which is something abstracted from *great* and *small*, from this or that particular magnitude or figure. So likewise as to motion; *swift* and *slow* are altogether relative to the succession of ideas in our own minds. But, it doth not follow, because those modifications of motion exist not without the mind, that therefore absolute motion abstracted from them doth not.

Phil. Pray what is it that distinguishes one motion, or one part of extension, from another? Is it not something sensible, as some degree of swiftness or slowness, some certain magnitude or figure peculiar to each?

Hyl. I think so.

Phil. These qualities, therefore, stripped of all sensible properties, are without all specific and numerical differences, as the schools call them.

Hyl. They are.

Phil. That is to say, they are extension in general, and motion in general.

Hyl. Let it be so.

Phil. But it is a universally received maxim that *Everything which exists is particular*. How then can motion in general, or extension in general, exist in any corporeal substance? {193}

Hyl. I will take time to solve your difficulty.

Phil. But I think the point may be speedily decided. Without doubt you can tell whether you are able to frame this or that idea. Now I am content to put our dispute on this issue. If you can frame in your thoughts a distinct *abstract idea* of motion or extension, divested of all those sensible modes, as swift and slow, great and small, round and square, and the like, which are acknowledged to exist only in the mind, I will then yield the point you contend for. But if you cannot, it will be unreasonable on your side to insist any longer upon what you have no notion of.

Hyl. To confess ingenuously, I cannot.

Phil. Can you even separate the ideas of extension and motion from the ideas of all those qualities which they who make the distinction term *secondary*?

Hyl. What! is it not an easy matter to consider extension and motion by themselves, abstracted from all other sensible qualities? Pray how do the mathematicians treat of them?

Phil. I acknowledge, Hylas, it is not difficult to form general propositions and reasonings about those qualities, without mentioning any other; and, in this sense, to consider or treat of them abstractedly. But, how doth it follow that, because I can pronounce the word *motion* by itself, I can form the idea of it in my mind exclusive of body? or, because theorems may be made of extension

and figures, without any mention of *great* or *small*, or any other sensible mode or quality, that therefore it is possible such an abstract idea of extension, without any particular size or figure, or sensible quality,[3] [should be distinctly formed, and apprehended by the mind? Mathematicians treat of quantity, without regarding what other sensible. qualities it is attended with, as being altogether indifferent to their demonstrations. But, when laying aside the words, they contemplate the bare ideas, I believe you will find, they are not the pure abstracted ideas of extension.

Hyl. But what say you to *pure intellect*? May not abstracted ideas be framed by that faculty?

Phil. Since I cannot frame abstract ideas at all, it is plain I cannot frame them by the help of *pure intellect*; {194} whatsoever faculty you understand by those words. Besides, not to inquire into the nature of pure intellect and its spiritual objects, as *virtue*, *reason*, *God*, or the like, thus much seems manifest -- that sensible things are only to be perceived by sense, or represented by the imagination. Figures, therefore, and extension, being originally perceived by sense, do not belong to pure intellect: but, for your farther satisfaction, try if you can frame the idea of any figure, abstracted from all particularities of size, or even from other sensible qualities.

Hyl. Let me think a little -- I do not find that I can.

Phil. And can you think it possible that should really exist in nature which implies a repugnancy in its conception?

Hyl. By no means.

Phil. Since therefore it is impossible even for the mind to disunite the ideas of extension and motion from all other sensible qualities, doth it not follow, that where the one exist there necessarily the other exist likewise?

Hyl. It should seem so.

Phil. Consequently, the very same arguments which you admitted as conclusive against the Secondary Qualities are, without any farther application of force, against the Primary too. Besides, if you will trust your senses, is it not plain all sensible qualities coexist, or to them appear as being in the same place? Do they ever represent a motion, or figure, as being divested of all other visible and tangible qualities?

Hyl. You need say no more on this head. I am free to own, if there be no secret error or oversight in our proceedings hitherto, that all sensible qualities are alike to be denied existence without the mind. But, my fear is that I have been too liberal in my former concessions, or overlooked some fallacy or other. In short, I did not take time to think.

Phil. For that matter, Hylas, you may take what time you please in reviewing the progress of our inquiry. You are at liberty to recover any slips you might have made, or offer whatever you have omitted which makes for your first opinion.

Hyl. One great oversight I take to be this -- that I did not sufficiently distinguish the *object* from the *sensation*. Now, though this latter may not exist without the mind, yet it will not thence follow that the former cannot.

Phil. What object do you mean? the object of the senses?

Hyl. The same.

Phil. It is then immediately perceived? {195}

Hyl. Right.

***Phil*. Make me to understand the difference between what is immediately perceived and a sensation.**

***Hyl*. The sensation I take to be an act of the mind perceiving; besides which, there is something perceived; and this I call the *object*. For example, there is red and yellow on that tulip. But then the act of perceiving those colours is in me only, and not in the tulip.**

***Phil*. What tulip do you speak of? Is it that which you see?**

***Hyl*. The same.**

***Phil*. And what do you see beside colour, figure, and extension?**

***Hyl*. Nothing.**

***Phil*. What you would say then is that the red and yellow are coexistent with the extension; is it not?**

***Hyl*. That is not all; I would say they have a real existence without the mind, in some unthinking substance.**

***Phil*. That the colours are really in the tulip which I see is manifest. Neither can it be denied that this tulip may exist independent of your mind or mine; but, that any immediate object of the senses, -- that is, any idea, or combination of ideas -- should exist in an unthinking substance, or exterior to *all* minds, is in itself an evident contradiction. Nor can I imagine how this follows from what you said just now, to wit, that the red and yellow were on the tulip *you saw*, since you do not pretend to *see* that unthinking substance.**

***Hyl*. You have an artful way, Philonous, of diverting our inquiry from the subject.**

***Phil*. I see you have no mind to be pressed that way. To return then to your distinction between *sensation* and *object*; if I take you right, you distinguish in every perception two things, the one an action of the mind, the other not.**

***Hyl*. True.**

***Phil*. And this action cannot exist in, or belong to, any unthinking thing; but, whatever beside is implied in a perception may? {196}**

***Hyl*. That is my meaning.**

***Phil*. So that if there was a perception without any act of the mind, it were possible such a perception should exist in an unthinking substance?**

***Hyl*. I grant it. But it is impossible there should be such a perception.**

***Phil*. When is the mind said to be active?**

***Hyl*. When it produces, puts an end to, or changes, anything.**

***Phil*. Can the mind produce, discontinue, or change anything, but by an act of the will?**

***Hyl*. It cannot.**

***Phil*. The mind therefore is to be accounted *active* in its perceptions so far forth as *volition* is included in them?**

***Hyl*. It is.**

***Phil*. In plucking this flower I am active; because I do it by the motion of my hand, which was consequent upon my volition; so likewise in applying it to my nose. But is either of these smelling?**

***Hyl*. *No*.**

***Phil*. I act too in drawing the air through my nose; because my breathing so rather than otherwise is the effect of my volition. But neither can this be called *smelling*: for, if it were, I should smell every time I breathed in that manner?**

***Hyl*. True.**

***Phil*. Smelling then is somewhat consequent to all this?**

***Hyl*. It is.**

***Phil*. But I do not find my will concerned any farther. Whatever more there is -- as that I perceive such a particular smell, or any smell at all -- this is independent of my will, and therein I am altogether passive. Do you find it otherwise with you, Hylas?**

***Hyl*. No, the very same.**

***Phil*. Then, as to seeing, is it not in your power to open your eyes, or keep them shut; to turn them this or that way?**

***Hyl*. Without doubt.**

***Phil*. But, doth it in like manner depend on *your* will that in looking on this flower you perceive *white* rather than any other colour? Or, directing your open eyes towards yonder part of the heaven, can you avoid seeing the sun? Or is light or darkness the effect of your volition?**

***Hyl*. No, certainly.**

***Phil*. You are then in these respects altogether passive? {197}**

***Hyl*. I am.**

***Phil*. Tell me now, whether *seeing* consists in perceiving light and colours, or in opening and turning the eyes?**

***Hyl*. Without doubt, in the former.**

***Phil*. Since therefore you are in the very perception of light and colours altogether passive, what is become of that action you were speaking of as an ingredient in every sensation? And, doth it not follow from your own concessions, that the perception of light and colours, including no action in it, may exist in an unperceiving substance? And is not this a plain contradiction?**

***Hyl*. I know not what to think of it.**

***Phil*. Besides, since you distinguish the *active* and *passive* in every perception, you must do it in that of pain. But how is it possible that pain, be it as little active as you please, should exist in an unperceiving substance? In short, do but consider the point, and then confess ingenuously, whether light and colours, tastes, sounds, &c. are not all equally passions or sensations in the soul. You may indeed call them *external objects*, and give them in words what subsistence you please. But, examine your own thoughts, and then tell me whether it be not as I say?**

***Hyl*. I acknowledge, Philonous, that, upon a fair observation of what passes in my mind, I can discover nothing else but that I am a thinking being, affected with variety of sensations; neither is it possible to conceive how a sensation should exist in an unperceiving substance. But then, on the other hand, when I look on sensible things in a different view, considering them as so many modes and qualities, I find it necessary to suppose a *material substratum*, without which they cannot be conceived to exist.**

***Phil*. *Material substratum* call you it? Pray, by which of your senses came you acquainted with that being?**

***Hyl*. It is not itself sensible; its modes and qualities only being perceived by the senses.**

***Phil*. I presume then it was by reflexion and reason you obtained**

the idea of it?

***Hyl*. I do not pretend to any proper positive *idea* of it. However, I conclude it exists, because qualities cannot be conceived to exist without a support.**

***Phil*. It seems then you have only a relative *notion* of it, or that you conceive it not otherwise than by conceiving the relation it bears to sensible qualities? {198}**

***Hyl*. Right.**

***Phil*. Be pleased therefore to let me know wherein that relation**

consists.

***Hyl*. Is it not sufficiently expressed in the term *substratum*, or *substance*?**

***Phil*. If so, the word *substratum* should import that it is spread under the sensible qualities or accidents?**

***Hyl*. True.**

***Phil*. And consequently under extension?**

***Hyl*. I own it.**

***Phil*. It is therefore somewhat in its own nature entirely distinct**

from extension?

***Hyl*. I tell you, extension is only a mode, and Matter is something that supports modes. And is it not evident the thing supported is different from the thing supporting?**

***Phil*. So that something distinct from, and exclusive of, extension is supposed to be the *substratum* of extension?**

***Hyl*. Just so.**

***Phil*. Answer me, Hylas. Can a thing be spread without extension? or is not the idea of extension necessarily included in *spreading*?**

***Hyl*. It is.**

***Phil*. Whatsoever therefore you suppose spread under anything must have in itself an extension distinct from the extension of that thing under which it is spread?**

***Hyl*. It must.**

***Phil*. Consequently, every corporeal substance, being the *substratum* of extension, must have in itself another extension, by which it is qualified to be a *substratum*: and so on to infinity. And I ask whether this be not absurd in itself, and repugnant to what you granted just now, to wit, that the *substratum* was something distinct from and exclusive of extension?**

***Hyl*. Aye but, Philonous, you take me wrong. I do not mean that Matter is *spread* in a gross literal sense under extension. The word *substratum* is used only to express in general the same thing with *substance*.**

***Phil*. Well then, let us examine the relation implied in the term *substance*. Is it not that it stands under accidents?**

***Hyl*. The very same.**

***Phil*. But, that one thing may stand under or support another, must it not be extended?**

***Hyl*. It must. {199}**

***Phil*. Is not therefore this supposition liable to the same absurdity with the former?**

***Hyl*. You still take things in a strict literal sense. That is not fair, Philonous.**

***Phil*. I am not for imposing any sense on your words: you are at liberty to explain them as you please. Only, I beseech you, make me understand something by them. You tell me Matter supports or stands under accidents. How! is it as your legs support your body?**

***Hyl*. No; that is the literal sense.**

***Phil*. Pray let me know any sense, literal or not literal, that you understand it in. -- How long must I wait for an answer, Hylas?**

***Hyl*. I declare I know not what to say. I once thought I understood well enough what was meant by Matter's supporting accidents. But now, the more I think on it the less can I comprehend it: in short I find that I know nothing of it.**

***Phil*. It seems then you have no idea at all, neither relative nor positive, of Matter; you know neither what it is in itself, nor what relation it bears to accidents?**

***Hyl*. I acknowledge it.**

***Phil*. And yet you asserted that you could not conceive how qualities or accidents should really exist, without conceiving at the same time a material support of them?**

***Hyl*. I did.**

***Phil*. That is to say, when you conceive the real existence of qualities, you do withal conceive Something which you cannot conceive?**

***Hyl*. It was wrong, I own. But still I fear there is some fallacy or other. Pray what think you of this? It is just come into my head that the ground of all our mistake lies in your treating of each quality by itself. Now, I grant that each quality cannot singly subsist without the mind. Colour cannot without extension, neither can figure without some other sensible quality. But, as the several qualities united or blended together form entire sensible things, nothing hinders why such things may not be supposed to exist without the mind.**

***Phil*. Either, Hylas, you are jesting, or have a very bad memory. Though indeed we went through all the qualities by name one after another, yet my arguments or rather your concessions, nowhere tended to prove that the Secondary Qualities did not subsist each alone by itself; but, that they were not {200} *at all* without the mind. Indeed, in treating of figure and motion we concluded they could not exist without the mind, because it was impossible even in thought to separate them from all secondary qualities, so as to conceive them existing by themselves. But then this was not the only argument made use of upon that occasion. But (to pass by all that hath been hitherto said, and reckon it for nothing, if you will have it so) I am content to put the whole upon this issue. If you can conceive it possible for any mixture or combination of qualities, or any sensible object whatever, to exist without the mind, then I will grant it actually to be so.**

***Hyl*. If it comes to that the point will soon be decided. What more easy than to conceive a tree or house existing by itself, independent of, and unperceived by, any mind whatsoever? I do at this present time conceive them existing after that manner.**

***Phil*. How say you, Hylas, can you see a thing which is at the same time unseen?**

Hyl. No, that were a contradiction.

Phil. Is it not as great a contradiction to talk of _conceiving_ a thing which is _unconceived_?

Hyl. It is.

Phil. The, tree or house therefore which you think of is conceived by you?

Hyl. How should it be otherwise?

Phil. And what is conceived is surely in the mind?

Hyl. Without question, that which is conceived is in the mind.

Phil. How then came you to say, you conceived a house or tree existing independent and out of all minds whatsoever?

Hyl. That was I own an oversight; but stay, let me consider what led me into it. -- It is a pleasant mistake enough. As I was thinking of a tree in a solitary place, where no one was present to see it, methought that was to conceive a tree as existing unperceived or unthought of; not considering that I myself conceived it all the while. But now I plainly see that all I can do is to frame ideas in my own mind. I may indeed conceive in my own thoughts the idea of a tree, or a house, or a mountain, but that is all. And this is far from proving that I can conceive them _existing out of the minds of all Spirits_.

Phil. You acknowledge then that you cannot possibly conceive how any one corporeal sensible thing should exist otherwise than in the mind? {201}

Hyl. I do.

Phil. And yet you will earnestly contend for the truth of that which you cannot so much as conceive?

Hyl. I profess I know not what to think; but still there are some scruples remain with me. Is it not certain I _see things at_ a distance? Do we not perceive the stars and moon, for example, to be a great way off? Is not this, I say, manifest to the senses?

Phil. Do you not in a dream too perceive those or the like objects?

Hyl. I do.

Phil. And have they not then the same appearance of being distant?

Hyl. They have.

Phil. But you do not thence conclude the apparitions in a dream to be without the mind?

Hyl. By no means.

Phil. You ought not therefore to conclude that sensible objects are without the mind, from their appearance, or manner wherein they are perceived.

Hyl. I acknowledge it. But doth not my sense deceive me in those cases?

Phil. By no means. The idea or thing which you immediately perceive, neither sense nor reason informs you that it actually exists without the mind. By sense you only know that you are affected with such certain sensations of light and colours, &c. And these you will not say are without the mind.

Hyl. True: but, beside all that, do you not think the sight suggests something of _outness or distance_?

Phil. Upon approaching a distant object, do the visible size and figure change perpetually, or do they appear the same at all distances?

***Hyl*. They are in a continual change.**

***Phil*. Sight therefore doth not suggest, or any way inform you, that the visible object you immediately perceive exists at a distance, or will be perceived when you advance farther onward; there being a continued series of visible objects succeeding each other during the whole time of your approach.**

***Hyl*. It doth not; but still I know, upon seeing an object, what object I shall perceive after having passed over a certain distance: {202} no matter whether it be exactly the same or no: there is still something of distance suggested in the case.**

***Phil*. Good Hylas, do but reflect a little on the point, and then tell me whether there be any more in it than this: from the ideas you actually perceive by sight, you have by experience learned to collect what other ideas you will (according to the standing order of nature) be affected with, after such a certain succession of time and motion.**

***Hyl*. Upon the whole, I take it to be nothing else.**

***Phil*. Now, is it not plain that if we suppose a man born blind was on a sudden made to see, he could at first have no experience of what may be *suggested* by sight?**

***Hyl*. It is.**

***Phil*. He would not then, according to you, have any notion of distance annexed to the things he saw; but would take them for a new set of sensations, existing only in his mind?**

***Hyl*. It is undeniable.**

***Phil*. But, to make it still more plain: is not *distance* a line turned endwise to the eye?**

***Hyl*. It is.**

***Phil*. And can a line so situated be perceived by sight?**

***Hyl*. It cannot.**

***Phil*. Doth it not therefore follow that distance is not properly and immediately perceived by sight?**

***Hyl*. It should seem so.**

***Phil*. Again, is it your opinion that colours are at a distance?**

***Hyl*. It must be acknowledged they are only in the mind.**

***Phil*. But do not colours appear to the eye as coexisting in the same place with extension and figures?**

***Hyl*. They do.**

***Phil*. How can you then conclude from sight that figures exist without, when you acknowledge colours do not; the sensible appearance being the very same with regard to both?**

***Hyl*. I know not what to answer.**

***Phil*. But, allowing that distance was truly and immediately perceived by the mind, yet it would not thence follow it existed out of the mind. For, whatever is immediately perceived is an idea: and can any idea exist out of the mind?**

***Hyl*. To suppose that were absurd: but, inform me, Philonous, can we perceive or know nothing beside our ideas?**

***Phil*. As for the rational deducing of causes from effects, {203} that is beside our inquiry. And, by the senses you can best tell whether you perceive anything which is not immediately perceived. And**

I ask you, whether the things immediately perceived are other than your own sensations or ideas? You have indeed more than once, in the course of this conversation, declared yourself on those points; but you seem, by this last question, to have departed from what you then thought.

Hyl. To speak the truth, Philonous, I think there are two kinds of objects: -- the one perceived immediately, which are likewise called *ideas*; the other are real things or external objects, perceived by the mediation of ideas, which are their images and representations. Now, I own ideas do not exist without the mind; but the latter sort of objects do. I am sorry I did not think of this distinction sooner; it would probably have cut short your discourse.

Phil. Are those external objects perceived by sense or by some other faculty?

Hyl. They are perceived by sense.

Phil. Howl Is there any thing perceived by sense which is not immediately perceived?

Hyl. Yes, Philonous, in some sort there is. For example, when I look on a picture or statue of Julius Caesar, I may be said after a manner to perceive him (though not immediately) by my senses.

Phil. It seems then you will have our ideas, which alone are immediately perceived, to be pictures of external things: and that these also are perceived by sense, inasmuch as they have a conformity or resemblance to our ideas?

Hyl. That is my meaning.

Phil. And, in the same way that Julius Caesar, in himself invisible, is nevertheless perceived by sight; real things, in themselves imperceptible, are perceived by sense.

Hyl. In the very same.

Phil. Tell me, Hylas, when you behold the picture of Julius Caesar, do you see with your eyes any more than some colours and figures, with a certain symmetry and composition of the whole?

Hyl. Nothing else.

Phil. And would not a man who had never known anything of Julius Caesar see as much? {204}

Hyl. He would.

Phil. Consequently he hath his sight, and the use of it, in as perfect a degree as you?

Hyl. I agree with you.

Phil. Whence comes it then that your thoughts are directed to the Roman emperor, and his are not? This cannot proceed from the sensations or ideas of sense by you then perceived; since you acknowledge you have no advantage over him in that respect. It should seem therefore to proceed from reason and memory: should it not?

Hyl. It should.

Phil. Consequently, it will not follow from that instance that anything is perceived by sense which is not, immediately perceived. Though I grant we may, in one acceptation, be said to perceive sensible things mediately by sense: that is, when, from a frequently perceived connexion, the immediate perception of ideas by one sense *suggests* to the mind others, perhaps belonging to another sense, which are wont to be connected with them. For instance, when I hear a coach drive along the streets, immediately I perceive only the sound; but, from the experience I have had that such a sound is connected with a coach, I am said to hear the coach. It is nevertheless evident that, in truth and strictness, nothing can be *heard but sound*; and the coach is not then properly perceived by sense, but suggested from experience. So likewise when we are said to see a red-hot

bar of iron; the solidity and heat of the iron are not the objects of sight, but suggested to the imagination by the colour and figure which are properly perceived by that sense. In short, those things alone are actually and strictly perceived by any sense, which would have been perceived in case that same sense had then been first conferred on us. As for other things, it is plain they are only suggested to the mind by experience, grounded on former perceptions. But, to return to your comparison of Caesar's picture, it is plain, if you keep to that, you must hold the real things, or archetypes of our ideas, are not perceived by sense, but by some internal faculty of the soul, as reason or memory. I would therefore fain know what arguments you can draw from reason for the existence of what you call *real things or material objects*. Or, whether you remember to have seen them formerly as they are in themselves; or, if you have heard or read of any one that did. {205}

Hyl. I see, Philonous, you are disposed to raillery; but that will never convince me.

Phil. My aim is only to learn from you the way to come at the knowledge of *material beings*. Whatever we perceive is perceived immediately or mediately: by sense, or by reason and reflexion. But, as you have excluded sense, pray shew me what reason you have to believe their existence; or what *medium* you can possibly make use of to prove it, either to mine or your own understanding.

Hyl. To deal ingenuously, Philonous, now I consider the point, I do not find I can give you any good reason for it. But, thus much seems pretty plain, that it is at least possible such things may really exist. And, as long as there is no absurdity in supposing them, I am resolved to believe as I did, till you bring good reasons to the contrary.

Phil. What! Is it come to this, that you only *believe* the existence of material objects, and that your belief is founded barely on the possibility of its being true? Then you will have me bring reasons against it: though another would think it reasonable the proof should lie on him who holds the affirmative. And, after all, this very point which you are now resolved to maintain, without any reason, is in effect what you have more than once during this discourse seen good reason to give up. But, to pass over all this; if I understand you rightly, you say our ideas do not exist without the mind, but that they are copies, images, or representations, of certain originals that do?

Hyl. You take me right.

Phil. They are then like external things?

Hyl. They are.

Phil. Have those things a stable and permanent nature, independent of our senses; or are they in a perpetual change, upon our producing any motions in our bodies -- suspending, exerting, or altering, our faculties or organs of sense?

Hyl. Real things, it is plain, have a fixed and real nature, which remains the same notwithstanding any change in our senses, or in the posture and motion of our bodies; which indeed may affect the ideas in our minds, but it were absurd to think they had the same effect on things existing without the mind.

Phil. How then is it possible that things perpetually fleeting and variable as our ideas should be copies or images of anything fixed and constant? Or, in other words, since all sensible {206} qualities, as size, figure, colour, &c., that is, our ideas, are continually changing, upon every alteration in the distance, medium, or instruments of sensation; how can any determinate material objects be properly represented or painted forth by several distinct things, each of which is so different from and unlike the rest? Or, if you say it resembles some one only of our ideas, how shall we be able to distinguish the true copy from all the false ones?

***Hyl*. I profess, Philonous, I am at a loss. I know not what to say to this.**

***Phil*. But neither is this all. Which are material objects in themselves -- perceptible or imperceptible?**

***Hyl*. Properly and immediately nothing can be perceived but ideas. All material things, therefore, are in themselves insensible, and to be perceived only by our ideas.**

***Phil*. Ideas then are sensible, and their archetypes or originals insensible?**

***Hyl*. Right.**

***Phil*. But how can that which is sensible be like that which is insensible? Can a real thing, in itself *invisible*, be like a *colour*; or a real thing, which is not *audible*, be like a *sound*? In a word, can anything be like a sensation or idea, but another sensation or idea?**

***Hyl*. I must own, I think not.**

***Phil*. Is it possible there should be any doubt on the point? Do. you not perfectly know your own ideas?**

***Hyl*. I know them perfectly; since what I do not perceive or know can be no part of my idea.**

***Phil*. Consider, therefore, and examine them, and then tell me if there be anything in them which can exist without the mind: or if you can conceive anything like them existing without the mind.**

***Hyl*. Upon inquiry, I find it is impossible for me to conceive or understand how anything but an idea can be like an idea. And it is most evident that *no idea can exist without the mind*.**

***Phil*. You are therefore, by your principles, forced to deny the *reality* of sensible things; since you made it to consist in an absolute existence exterior to the mind. That is to say, you are a downright sceptic. So I have gained my point, which was to shew your principles led to Scepticism. {207}**

***Hyl*. For the present I am, if not entirely convinced, at least silenced.**

***Phil*. I would fain know what more you would require in order to a perfect conviction. Have you not had the liberty of explaining yourself all manner of ways? Were any little slips in discourse laid hold and insisted on? Or were you not allowed to retract or reinforce anything you had offered, as best served your purpose? Hath not everything you could say been heard and examined with all the fairness imaginable? In a word have you not in every point been convinced out of your own mouth? And, if you can at present discover any flaw in any of your former concessions, or think of any remaining subterfuge, any new distinction, colour, or comment whatsoever, why do you not produce it?**

***Hyl*. A little patience, Philonous. I am at present so amazed to see myself ensnared, and as it were imprisoned in the labyrinths you have drawn me into, that on the sudden it cannot be expected I should find my way out. You must give me time to look about me and recollect myself.**

***Phil*. Hark; is not this the college bell?**

***Hyl*. It rings for prayers.**

***Phil*. We will go in then, if you please, and meet here again tomorrow morning. In the meantime, you may employ your thoughts on this morning's discourse, and try if you can find any fallacy in it, or invent any new means to extricate yourself.**

***Hyl*. Agreed. {208}**

The Second Dialogue

***Hylas*. I beg your pardon, Philonous, for not meeting you sooner. All this morning my head was so filled with our late conversation that I had not leisure to think of the time of the day, or indeed of anything else.**

***Philonous*. I am glad you were so intent upon it, in hopes if there were any mistakes in your concessions, or fallacies in my reasonings from them, you will now discover them to me.**

***Hyl*. I assure you I have done nothing ever since I saw you but search after mistakes and fallacies, and, with that view, have minutely examined the whole series of yesterday's discourse: but all in vain, for the notions it led me into, upon review, appear still more clear and evident; and, the more I consider them, the more irresistibly do they force my assent.**

***Phil*. And is not this, think you, a sign that they are genuine, that they proceed from nature, and are conformable to right reason? Truth and beauty are in this alike, that the strictest survey sets them both off to advantage; while the false lustre of error and disguise cannot endure being reviewed, or too nearly inspected.**

***Hyl*. I own there is a great deal in what you say. Nor can any one be more entirely satisfied of the truth of those odd consequences, so long as I have in view the reasonings that lead to them. But, when these are out of my thoughts, there seems, on the other hand, something so satisfactory, so natural and intelligible, in the modern way of explaining things that, I profess, I know not how to reject it.**

***Phil*. I know not what way you mean.**

***Hyl*. I mean the way of accounting for our sensations or ideas.**

***Phil*. How is that?**

***Hyl*. It is supposed the soul makes her residence in some part of the brain, from which the nerves take their rise, and are thence extended to all parts of the body; and that outward objects, by the different impressions they make on the organs of sense, communicate certain vibrative motions to the nerves; and these being filled with spirits propagate them to the brain {209} or seat of the soul, which, according to the various impressions or traces thereby made in the brain, is variously affected with ideas.**

***Phil*. And call you this an explication of the manner whereby we are affected with ideas?**

***Hyl*. Why not, Philonous? Have you anything to object against it?**

***Phil*. I would first know whether I rightly understand your hypothesis. You make certain traces in the brain to be the causes or occasions of our ideas. Pray tell me whether by the *brain* you mean any sensible thing.**

***Hyl*. What else think you I could mean?**

***Phil*. Sensible things are all immediately perceivable; and those things which are immediately perceivable are ideas; and these exist only in the mind. Thus much you have, if I mistake not, long since agreed to.**

***Hyl*. I do not deny it.**

***Phil*. The brain therefore you speak of, being a sensible thing, exists only in the mind. Now, I would**

fain know whether you think it reasonable to suppose that one idea or thing existing in the mind occasions all other ideas. And, if you think so, pray how do you account for the origin of that primary idea or brain itself?

Hyl. I do not explain the origin of our ideas by that brain which is perceivable to sense -- this being itself only a combination of sensible ideas -- but by another which I imagine.

Phil. But are not things imagined as truly *in the mind* as things perceived?

Hyl. I must confess they are.

Phil. It comes, therefore, to the same thing; and you have been all this while accounting for ideas by certain motions or impressions of the brain; that is, by some alterations in an idea, whether sensible or imaginable it matters not.

Hyl. I begin to suspect my hypothesis.

Phil. Besides spirits, all that we know or conceive are our own ideas. When, therefore, you say all ideas are occasioned by impressions in the brain, do you conceive this brain or no? If you do, then you talk of ideas imprinted in an idea causing that same idea, which is absurd. If you do not conceive it, you talk unintelligibly, instead of forming a reasonable hypothesis. {210}

Hyl. I now clearly see it was a mere dream. There is nothing in it.

Phil. You need not be much concerned at it; for after all, this way of explaining things, as you called it, could never have satisfied any reasonable man. What connexion is there between a motion in the nerves, and the sensations of sound or colour in the mind? Or how is it possible these should be the effect of that?

Hyl. But I could never think it had so little in it as now it seems to have.

Phil. Well then, are you at length satisfied that no sensible things have a real existence; and that you are in truth an arrant sceptic?

Hyl. It is too plain to be denied.

Phil. Look! are not the fields covered with a delightful verdure? Is there not something in the woods and groves, in the rivers and clear springs, that soothes, that delights, that transports the soul? At the prospect of the wide and deep ocean, or some huge mountain whose top is lost in the clouds, or of an old gloomy forest, are not our minds filled with a pleasing horror? Even in rocks and deserts is there not an agreeable wildness? How sincere a pleasure is it to behold the natural beauties of the earth! To preserve and renew our, relish for them, is not the veil of night alternately drawn over her face, and doth she not change her dress with the seasons? How aptly are the elements disposed! What variety and use [in the meanest productions of nature]![4] What delicacy, what beauty, what contrivance, in animal and vegetable bodies I How exquisitely are all things suited, as well to their particular ends, as to constitute opposite parts of the whole I And, while they mutually aid and support, do they not also set off and illustrate each other? Raise now your thoughts from this ball of earth to all those glorious luminaries that adorn the high arch of heaven. The motion and situation of the planets, are they not admirable for use and order? Were those (miscalled *erratic*) globes once known to stray, in their repeated journeys through the pathless void? Do they not measure areas round the sun ever proportioned to the times? So fixed, so immutable are the laws by which the unseen Author of nature actuates the universe. {211} How vivid and radiant is the lustre of the fixed stars! How magnificent and rich that negligent profusion with which they appear to be scattered throughout the whole azure vault! Yet, if you take the

telescope, it brings into your sight a new host of stars that escape the naked eye. Here they seem contiguous and minute, but to a nearer view immense orbs of fight at various distances, far sunk in the abyss of space. Now you must call imagination to your aid. The feeble narrow sense cannot descry innumerable worlds revolving round the central fires; and in those worlds the energy of an all-perfect Mind displayed in endless forms. But, neither sense nor imagination are big enough to comprehend the boundless extent, with all its glittering furniture. Though the labouring mind exert and strain each power to its utmost reach, there still stands out ungrasped a surplusage immeasurable. Yet all the vast bodies that compose this mighty frame, how distant and remote soever, are by some secret mechanism, some Divine art and force, linked in a mutual dependence and intercourse with each other; even with this earth, which was almost slipt from my thoughts and lost in the crowd of worlds. Is not the whole system immense, beautiful, glorious beyond expression and beyond thought! What treatment, then, do those philosophers deserve, who would deprive these noble and delightful scenes of all *reality*? How should those Principles be entertained that lead us to think all the visible beauty of the creation a false imaginary glare? To be plain, can you expect this Scepticism of yours will not be thought extravagantly absurd by all men of sense?

***Hyl*. Other men may think as they please; but for your part you have nothing to reproach me with. My comfort is, you are as much a sceptic as I am.**

***Phil*. There, Hylas, I must beg leave to differ from you.**

***Hyl*. What! Have you all along agreed to the premises, and do you now deny the conclusion, and leave me to maintain those paradoxes by myself which you led me into? This surely is not fair.**

***Phil*. *I* deny that I agreed with you in those notions that led to Scepticism. You indeed said the *reality* of sensible things consisted in *an absolute existence out of the minds of spirits*, or distinct from their being perceived. And pursuant to this notion of reality, *you* are obliged to deny sensible things any {212} real existence: that is, according to your own definition, you profess yourself a sceptic. But I neither said nor thought the reality of sensible things was to be defined after that manner. To me it is evident for the reasons you allow of, that sensible things cannot exist otherwise than in a mind or spirit. Whence I conclude, not that they have no real existence, but that., seeing they depend not on my thought, and have all existence distinct from being perceived by me, *there must be some other Mind wherein they exist*. As sure, therefore, as the sensible world really exists, so sure is there an infinite omnipresent Spirit who contains and supports it.**

***Hyl*. What! This is no more than I and all Christians hold; nay, and all others too who believe there is a God, and that He knows and comprehends all things.**

***Phil*. Aye, but here lies the difference. Men commonly believe that all things are known or perceived by God, because they believe the being of a God; whereas I, on the other side, immediately and necessarily conclude the being of a God, because all sensible things must be perceived by Him.**

***Hyl*. But, so long as we all believe the same thing, what matter is it how we come by that belief?**

***Phil*. But neither do we agree in the same opinion. For philosophers, though they acknowledge all corporeal beings to be perceived by God, yet they attribute to them an absolute subsistence distinct from their being perceived by any mind whatever; which I do not. Besides, is there no difference between saying, *There is a God, therefore He perceives all things*; and saying, *Sensible things do really exist*; *and, if they really exist, they are necessarily perceived by an infinite Mind*: *therefore there is an infinite Mind or God*? This furnishes you with a direct and immediate demonstration, from a most evident principle, of the *being of a God*. Divines and philosophers had proved beyond all**

controversy, from the beauty and usefulness of the several parts of the creation, that it was the workmanship of God. But that -- setting aside all help of astronomy and natural philosophy, all contemplation of the contrivance, order, and adjustment of things -- an infinite Mind should be necessarily inferred from the bare *existence of the sensible world*, is an advantage to them only who have made this easy reflexion: that the sensible world is that which we perceive by our several senses; and that nothing is perceived by the senses beside ideas; and that no {213} idea or archetype of an idea can exist otherwise than in a mind. You may now, without any laborious search into the sciences, without any subtlety of reason, or tedious length of discourse, oppose and baffle the most strenuous advocate for Atheism. Those miserable refuges, whether in an eternal succession of unthinking causes and effects, or in a fortuitous concourse of atoms; those wild imaginations of Vanini, Hobbes, and Spinoza: in a word, the whole system of Atheism, is it not entirely overthrown, by this single reflexion on the repugnancy included in supposing the whole, or any part, even the most rude and shapeless, of the visible world, to exist without a mind? Let any one of those abettors of impiety but look into his own thoughts, and there try if he can conceive how so much as a rock, a desert, a chaos, or confused jumble of atoms; how anything at all, either sensible or imaginable, can exist independent of a Mind, and he need go no farther to be convinced of his folly. Can anything be fairer than to put a dispute on such an issue, and leave it to a man himself to see if he can conceive, even in thought, what he holds to be true in fact, and from a notional to allow it a real existence?

Hyl. It cannot be denied there is something highly serviceable to religion in what you advance. But do you not think it looks very like a notion entertained by some eminent moderns, of *seeing all things in God*?

Phil. I would gladly know that opinion: pray explain it to me.

Hyl. They conceive that the soul, being immaterial, is incapable of being united with material things, so as to perceive them in themselves; but that she perceives them by her union with the substance of God, which, being spiritual, is therefore purely intelligible, or capable of being the immediate object of a spirit's thought. Besides the Divine essence contains in it perfections correspondent to each created being; and which are, for that reason, proper to exhibit or represent them to the mind.

Phil. I do not understand how our ideas, which are things altogether passive and inert, can be the essence, or any part (or like any part) of the essence or substance of God, who is an {214} impassive, indivisible, pure, active being. Many more difficulties and objections there are which occur at first view against this hypothesis; but I shall only add that it is liable to all the absurdities of the common hypothesis, in making a created world exist otherwise than in the mind of a Spirit. Besides all which it hath this peculiar to itself; that it makes that material world serve to no purpose. And, if it pass for a good argument against other hypotheses in the sciences, that they suppose Nature, or the Divine wisdom, to make something in vain, or do that by tedious roundabout methods which might have been performed in a much more easy and compendious way, what shall we think of that hypothesis which supposes the whole world made in vain?

Hyl. But what say you? Are not you too of opinion that we see all things in God? If I mistake not, what you advance comes near it.

Phil. [Few men think; yet all have opinions. Hence men's opinions are superficial and confused. It is nothing strange that tenets which in themselves are ever so different, should nevertheless be confounded with each other, by those who do not consider them attentively. I shall not therefore be

surprised if some men imagine that I run into the enthusiasm of Malebranche; though in truth I am very remote from it. He builds on the most abstract general ideas, which I entirely disclaim. He asserts an absolute external world, which I deny. He maintains that we are deceived by our senses, and, know not the real natures or the true forms and figures of extended beings; of all which I hold the direct contrary. So that upon the whole there are no Principles more fundamentally opposite than his and mine. It must be owned that][5] I entirely agree with what the holy Scripture saith, "That in God we live and move and have our being." But that we see things in His essence, after the manner above set forth, I am far from believing. Take here in brief my meaning: -- It is evident that the things I perceive are my own ideas, and that no idea can exist unless it be in a mind: nor is it less plain that these ideas or things by me perceived, either themselves or their archetypes, exist independently of my mind, since I know myself not to be their author, it being out of my power to determine at pleasure what particular ideas I shall be affected with upon opening my eyes or ears: they must therefore exist in some other Mind, whose {215} Will it is they should be exhibited to me. The things, I say, immediately perceived are ideas or sensations, call them which you will. But how can any idea or sensation exist in, or be produced by, anything but a mind or spirit? This indeed is inconceivable. And to assert that which is inconceivable is to talk nonsense: is it not?

Hyl. Without doubt.

Phil. But, on the other hand, it is very conceivable that they should exist in and be produced by a spirit; since this is no more than I daily experience in myself, inasmuch as I perceive numberless ideas; and, by an act of my will, can form a great variety of them, and raise them up in my imagination: though, it must be confessed, these creatures of the fancy are not altogether so distinct, so strong, vivid, and permanent, as those perceived by my senses -- which latter are called *red things*. From all which I conclude, *there is a Mind which affects me every moment with all the sensible impressions I perceive*. *And*, from the variety, order, and manner of these, I conclude *the Author of them to be wise, powerful, and good, beyond comprehension*. *Mark* it well; I do not say, I see things by perceiving that which represents them in the intelligible Substance of God. This I do not understand; but I say, the things by me perceived are known by the understanding, and produced by the will of an infinite Spirit. And is not all this most plain and evident? Is there any more in it than what a little observation in our own minds, and that which passeth in them, not only enables us to conceive, but also obliges us to acknowledge.

Hyl. I think I understand you very clearly; and own the proof you give of a Deity seems no less evident than it is surprising. But, allowing that God is the supreme and universal Cause of an things, yet, may there not be still a Third Nature besides Spirits and Ideas? May we not admit a subordinate and limited cause of our ideas? In a word, may there not for all that be *Matter*?

Phil. How often must I inculcate the same thing? You allow the things immediately perceived by sense to exist nowhere without the mind; but there is nothing perceived by sense which is not perceived immediately: therefore there is nothing sensible that exists without the mind. The Matter, therefore, which you still insist on is something intelligible, I suppose; something that may be discovered by reason, and not by sense.

Hyl. You are in the right. {216}

Phil. Pray let me know what reasoning your belief of Matter is grounded on; and what this Matter is, in your present sense of it.

Hyl. I find myself affected with various ideas, whereof I know I am not the cause; neither are they the cause of themselves, or of one another, or capable of subsisting by themselves, as being

altogether inactive, fleeting, dependent beings. They have therefore *some* cause distinct from me and them: of which I pretend to know no more than that it is *the cause of my ideas*. And this thing, whatever it be, I call Matter.

Phil. Tell me, Hylas, hath every one a liberty to change the current proper signification attached to a common name in any language? For example, suppose a traveller should tell you that in a certain country men pass unhurt through the fire; and, upon explaining himself, you found he meant by the word fire that which others call *water*. Or, if he should assert that there are trees that walk upon two legs, meaning men by the term *trees*. Would you think this reasonable?

Hyl. No; I should think it very absurd. Common custom is the standard of propriety in language. And for any man to affect speaking improperly is to pervert the use of speech, and can never serve to a better purpose than to protract and multiply disputes, where there is no difference in opinion.

Phil. And doth not *Matter*, in the common current acceptation of the word, signify an extended, solid, moveable, unthinking, inactive Substance?

Hyl. It doth.

Phil. And, hath it not been made evident that no *such* substance can possibly exist? And, though it should be allowed to exist, yet how can that which is *inactive* be a *cause*; or that which is *unthinking* be a *cause of thought*? You may, indeed, if you please, annex to the word *Matter* a contrary meaning to what is vulgarly received; and tell me you understand by it, an unextended, thinking, active being, which is the cause of our ideas. But what else is this than to play with words, and run into that very fault you just now condemned with so much reason? I do by no means find fault with your reasoning, in that you collect a cause from the *phenomena*: *but* I deny that *the* cause deducible by reason can properly be termed Matter.

Hyl. There is indeed something in what you say. But I am {217} afraid you do not thoroughly comprehend my meaning. I would by no means be thought to deny that God, or an infinite Spirit, is the Supreme Cause of all things. All I contend for is, that, subordinate to the Supreme Agent, there is a cause of a limited and inferior nature, which *concurs* in the production of our ideas, not by any act of will, or spiritual efficiency, but by that kind of action which belongs to Matter, viz. *motion*.

Phil. I find you are at every turn relapsing into your old exploded conceit, of a moveable, and consequently an extended, substance, existing without the mind. What! Have you already forgotten you were convinced; or are you willing I should repeat what has been said on that head? In truth this is not fair dealing in you, still to suppose the being of that which you have so often acknowledged to have no being. But, not to insist farther on what has been so largely handled, I ask whether all your ideas are not perfectly passive and inert, including nothing of action in them.

Hyl. They are.

Phil. And are sensible qualities anything else but ideas?

Hyl. How often have I acknowledged that they are not.

Phil. But is not *motion* a sensible quality?

Hyl. It is.

Phil. Consequently it is no action?

Hyl. I agree with you. And indeed it is very plain that when I stir my finger, it remains passive; but my will which produced the motion is active.

Phil. Now, I desire to know, in the first place, whether, motion being allowed to be no action, you can conceive any action besides volition: and, in the second place, whether to say something and conceive nothing be not to talk nonsense: and, lastly, whether, having considered the premises, you do not perceive that to suppose any efficient or active Cause of our ideas, other than _Spirit,_ is highly absurd and unreasonable?

Hyl. I give up the point entirely. But, though Matter may not be a cause, yet what hinders its being an _instrument,_ subservient to the supreme Agent in the production of our ideas?

Phil. An instrument say you; pray what may be the figure, springs, wheels, and motions, of that instrument?

Hyl. Those I pretend to determine nothing of, both the substance and its qualities being entirely unknown to me.

Phil. What? You are then of opinion it is made up of {218} unknown parts, that it hath unknown motions, and an unknown shape?

Hyl. I do not believe that it hath any figure or motion at all, being already convinced, that no sensible qualities can exist in an unperceiving substance.

Phil. But what notion is it possible to frame of an instrument void of all sensible qualities, even extension itself?

Hyl. I do not pretend to have any notion of it.

Phil. And what reason have you to think this unknown, this inconceivable Somewhat doth exist? Is it that you imagine God cannot act as well without it; or that you find by experience the use of some such thing, when you form ideas in your own mind?

Hyl. You are always teasing me for reasons of my belief. Pray what reasons have you not to believe it?

Phil. It is to me a sufficient reason not to believe the existence of anything, if I see no reason for believing it. But, not to insist on reasons for believing, you will not so much as let me know _what it is_ you would have me believe; since you say you have no manner of notion of it. After all, let me entreat you to consider whether it be like a philosopher, or even like a man of common sense, to pretend to believe you know not what ' and you know not why.

Hyl. Hold, Philonous. When I tell you Matter is an _instrument,_ I do not mean altogether nothing. It is true I know not the particular kind of instrument; but, however, I have some notion of _instrument in general,_ which I apply to it.

Phil. But what if it should prove that there is something, even in the most general notion of _instrument,_ as taken in a distinct sense from _cause,_ which makes the use of it inconsistent with the Divine attributes?

Hyl. Make that appear and I shall give up the point.

Phil. What mean you by the general nature or notion of _instrument_?

Hyl. That which is common to all particular instruments composeth the general notion.

Phil. Is it not common to all instruments, that they are applied to the doing those things only which cannot be performed by the mere act of our wills? Thus, for instance, I never use an instrument to move my finger, because it is done by a volition. But I should use one if I were to remove part of a rock, or tear up a tree by the roots. Are you of the same mind? {219} Or, can you shew any example where an instrument is made use of in producing an effect _immediately_ depending on the

will of the agent?

Hyl. I own I cannot.

Phil. How therefore can you suppose that an All-perfect Spirit, on whose Will all things have an absolute and immediate dependence, should need an instrument in his operations, or, not needing it, make use of it? Thus it seems to me that you are obliged to own the use of a lifeless inactive instrument to be incompatible with the infinite perfection of God; that is, by your own confession, to give up the point.

Hyl. It doth not readily occur what I can answer you.

Phil. But, methinks you should be ready to own the truth, when it has been fairly proved to you. We indeed, who are beings of finite powers, are forced to make use of instruments. And the use of an instrument sheweth the agent to be limited by rules of another's prescription, and that he cannot obtain his end but in such a way, and by such conditions. Whence it seems a clear consequence, that the supreme unlimited agent useth no tool or instrument at all. The will of an Omnipotent Spirit is no sooner exerted than executed, without the application of means; which, if they are employed by inferior agents, it is not upon account of any real efficacy that is in them, or necessary aptitude to produce any effect, but merely in compliance with the laws of nature, or those conditions prescribed to them by the First Cause, who is Himself above all limitation or prescription whatsoever.

Hyl. I will no longer maintain that Matter is an instrument. However, I would not be understood to give up its existence neither; since, notwithstanding what hath been said, it may still be an *occasion*.

Phil. How many shapes is your Matter to take? Or, how often must it be proved not to exist, before you are content to part with it? But, to say no more of this (though by all the laws of disputation I may justly blame you for so frequently changing the signification of the principal term) -- I would fain know what you mean by affirming that matter is an occasion, having already denied it to be a cause. And, when you have shewn in what sense you understand *occasion*, pray, in the next place, be pleased to shew me what reason induceth you to believe there is such an occasion of our ideas?

Hyl. As to the first point: by *occasion* I mean an inactive {220} unthinking being, at the presence whereof God excites ideas in our minds.

Phil. And what may be the nature of that inactive unthinking being?

Hyl. I know nothing of its nature.

Phil. Proceed then to the second point, and assign some reason why we should allow an existence to this inactive, unthinking, unknown thing.

Hyl. When we see ideas produced in our minds, after an orderly and constant manner, it is natural to think they have some fixed and regular occasions, at the presence of which they are excited.

Phil. You acknowledge then God alone to be the cause of our ideas, and that He causes them at the presence of those occasions.

Hyl. That is my opinion.

Phil. Those things which you say are present to God, without doubt He perceives.

Hyl. Certainly; otherwise they could not be to Him an occasion of acting.

Phil. Not to insist now on your making sense of this hypothesis, or answering all the puzzling questions and difficulties it is liable to: I only ask whether the order and regularity observable in

the series of our ideas, or the course of nature, be not sufficiently accounted for by the wisdom and power of God; and whether it doth not derogate from those attributes, to suppose He is influenced, directed, or put in mind, when and what He is to act, by an unthinking substance? And, lastly, whether, in case I granted all you contend for, it would make anything to your purpose; it not being easy to conceive how the external or absolute existence of an unthinking substance, distinct from its being perceived, can be inferred from my allowing that there are certain things perceived by the mind of God, which are to Him the occasion of producing ideas in us?

***Hyl*. I am perfectly at a loss what to think, this notion of *occasion* seeming now altogether as groundless as the rest.**

***Phil*. Do you not at length perceive that in all these different acceptations of *Matter*, you have been only supposing you know not what, for no manner of reason, and to no kind of use?**

***Hyl*. I freely own myself less fond of my notions since they have been so accurately examined. But still, methinks, I have some confused perception that there is such a thing as *Matter*. {221}**

***Phil*. Either you perceive the being of Matter immediately or mediately. If immediately, pray inform me by which of the senses you perceive it. If mediately, let me know by what reasoning it is inferred from those things which you perceive immediately. So much for the perception. Then for the Matter itself, I ask whether it is object, *substratum*, cause, instrument, or occasion? You have already pleaded for each of these, shifting your notions, and making Matter to appear sometimes in one shape, then in another. And what you have offered hath been disapproved and rejected by yourself. If you have anything new to advance I would gladly bear it.**

***Hyl*. I think I have already offered all I had to say on those heads. I am at a loss what more to urge.**

***Phil*. And yet you are loath to part with your old prejudice. But, to make you quit it more easily, I desire that, beside what has been hitherto suggested, you will farther consider whether, upon. supposition that Matter exists, you can possibly conceive how you should be affected by it. Or, supposing it did not exist, whether it be not evident you might for all that be affected with the same ideas you now are, and consequently have the very same reasons to believe its existence that you now can have.**

***Hyl*. I acknowledge it is possible we might perceive all things just as we do now, though there was no Matter in the world; neither can I conceive, if there be Matter, how it should produce' any idea in our minds. And, I do farther grant you have entirely satisfied me that it is impossible there should be such a thing as matter in any of the foregoing acceptations. But still I cannot help supposing that there is *Matter* in some sense or other. *What that is I* do not indeed pretend to determine.**

***Phil*. I do not expect you should define exactly the nature of that unknown being. Only be pleased to tell me whether it is a Substance; and if so, whether you can suppose a Substance without accidents; or, in case you suppose it to have accidents or qualities, I desire you will let me know what those qualities are, at least what is meant by Matter's supporting them?**

***Hyl*. We have already argued on those points. I have no more to say to them. But, to prevent any farther questions, let me tell you I at present understand by *Matter* neither substance nor accident, thinking nor extended being, neither cause, instrument, nor occasion, but Something entirely unknown, distinct from all these. {222}**

***Phil*. It seems then you include in your present notion of Matter nothing but the general abstract idea of *entity*.**

***Hyl*. Nothing else; save only that I super-add to this general idea the negation of all those particular things, qualities, or ideas, that I perceive, imagine, or in anywise apprehend.**

***Phil*. Pray where do you suppose this unknown Matter to exist?**

***Hyl*. Oh Philonous! now you think you have entangled me; for, if I say it exists in place, then you will infer that it exists in the mind, since it is agreed that place or extension exists only in the mind. But I am not ashamed to own my ignorance. I know not where it exists; only I am sure it exists not in place. There is a negative answer for you. And you must expect no other to all the questions you put for the future about Matter.**

***Phil*. Since you will not tell me where it exists, be pleased to inform me after what manner you suppose it to exist, or what you mean by its *existence*?**

***Hyl*. It neither thinks nor acts, neither perceives nor is perceived.**

***Phil*. But what is there positive in your abstracted notion of its existence?**

***Hyl*. Upon a nice observation, I do not find I have any positive notion or meaning at all. I tell you again, I am not ashamed to own my ignorance. I know not what is meant by its *existence*, or how it exists.**

***Phil*. Continue, good Hylas, to act the same ingenuous part, and tell me sincerely whether you can frame a distinct idea of Entity in general, prescinded from and exclusive of all thinking and corporeal beings, all particular things whatsoever.**

***Hyl*. Hold, let me think a little -- I profess, Philonous, I do not find that I can. At first glance, methought I had some dilute and airy notion of Pure Entity in abstract; but, upon closer attention, it hath quite vanished out of sight. The more I think on it, the more am I confirmed in my prudent resolution of giving none but negative answers, and not pretending to the least degree of any positive knowledge or conception of Matter, its *where*, its *how*, its *entity*, or anything belonging to it.**

***Phil*. When, therefore, you speak of the existence of Matter, you have not any notion in your mind?**

***Hyl*. None at all.**

***Phil*. Pray tell me if the case stands not thus -- At first, from a belief of material substance, you would have it that the {223} immediate objects existed without the mind; then that they are archetypes; then causes; next instruments; then occasions: lastly *something in general*, which being interpreted proves *nothing*. So Matter comes to nothing. What think you, Hylas, is not this a fair summary of your whole proceeding?**

***Hyl*. Be that as it will, yet I still insist upon it, that our not being able to conceive a thing is no argument against its existence.**

***Phil*. That from a cause, effect, operation, sign, or other circumstance, there may reasonably be inferred the existence of a thing not immediately perceived; and that it were absurd for any man to argue against the existence of that thing, from his having no direct and positive notion of it, I freely own. But, where there is nothing of all this; where neither reason nor revelation induces us to believe the existence of a thing; where we have not even a relative notion of it; where an abstraction is made from perceiving and being perceived, from Spirit and idea: lastly, where there is not so much as the most inadequate or faint idea pretended to -- I will not indeed thence conclude against the reality of any notion, or existence of anything; but my inference shall be, that you mean nothing at all; that you employ words to no manner of purpose, without any design or**

signification whatsoever. And I leave it to you to consider how mere jargon should be treated.

Hyl. To deal frankly with you, Philonous, your arguments seem in themselves unanswerable; but they have not so great an effect on me as to produce that entire conviction, that hearty acquiescence, which attends demonstration. I find myself relapsing into an obscure surmise of I know not what, *matter*.

Phil. But, are you not sensible, Hylas, that two things must concur to take away all scruple, and work a plenary assent in the mind,? Let a visible object be set in never so clear a light, yet, if there is any imperfection in the sight, or if the eye is not directed towards it, it will not be distinctly seen. And though a demonstration be never so well grounded and fairly proposed, yet, if there is withal a stain of prejudice, or a wrong bias on the understanding, can it be expected on a sudden to perceive clearly, and adhere firmly to the truth? No; there is need of time and pains: the attention must be awakened and detained by a frequent repetition of the same thing placed oft in the same, oft in different lights. I have said it already, and find I must still repeat and inculcate, that it is an unaccountable licence {224} you take, in pretending to maintain you know not what, for you know not what reason, to you know not what purpose. Can this be paralleled in any art or science, any sect or profession of men? Or is there anything so barefacedly groundless and unreasonable to be met with even in the lowest of common conversation? But, perhaps you will still say, Matter may exist; though at the same time you neither know *what is meant* by *Matter*, or by its *existence*. This indeed is surprising, and the more so because it is altogether voluntary [and of your own head],[6] you not being led to it by any one reason; for I challenge you to shew me that thing in nature which needs Matter to explain or account for it.

Hyl. *The reality* of things cannot be maintained without supposing the existence of Matter. And is not this, think you, a good reason why I should be earnest in its defence?

Phil. The reality of things! What things? sensible or intelligible?

Hyl. Sensible things.

Phil. My glove for example?

Hyl. That, or any other thing perceived by the senses.

Phil. But to fix on some particular thing. Is it not a sufficient evidence to me of the existence of this *glove*, that I see it, and feel it, and wear it? Or, if this will not do, how is it possible I should be assured of the reality of this thing, which I actually see in this place, by supposing that some unknown thing, which I never did or can see, exists after an unknown manner, in an unknown place, or in no place at all? How can the supposed reality of that which is intangible be a proof that anything tangible really exists? Or, of that which is invisible, that any visible thing, or, in general of anything which is imperceptible, that a perceptible exists? Do but explain this and I shall think nothing too hard for you.

Hyl. Upon the whole, I am content to own the existence of matter is highly improbable; but the direct and absolute impossibility of it does not appear to me.

Phil. But granting Matter to be possible, yet, upon that account merely, it can have no more claim to existence than a golden mountain, or a centaur.

Hyl. I acknowledge it; but still you do not deny it is possible; and that which is possible, for aught you know, may actually exist.

Phil. I deny it to be possible; and have, if I mistake not, {225} evidently proved, from your own

concessions, that it is not. In the common sense of the word *Matter*, is there any more implied than an extended, solid, figured, moveable substance, existing without the mind? And have not you acknowledged, over and over, that you have seen evident reason for denying the possibility of such a substance?

***Hyl*. True, but that is only one sense of the term *Matter*.**

***Phil*. But is it not the only proper genuine received sense? And, if Matter, in such a sense, be proved impossible, may it not be thought with good grounds absolutely impossible? Else how could anything be proved impossible? Or, indeed, how could there be any proof at all one way or other, to a man who takes the liberty to unsettle and change the common signification of words?**

***Hyl*. I thought philosophers might be allowed to speak more accurately than the vulgar, and were not always confined to the common acceptation of a term.**

***Phil*. But this now mentioned is the common received sense among philosophers themselves. But, not to insist on that, have you not been allowed to take Matter in what sense you pleased? And have you not used this privilege in the utmost extent; sometimes entirely changing, at others leaving out, or putting into the definition of it whatever, for the present, best served your design, contrary to all the known rules of reason and logic? And hath not this shifting, unfair method of yours spun out our dispute to an unnecessary length; Matter having been particularly examined, and by your own confession refuted in each of those senses? And can any more be required to prove the absolute impossibility of a thing, than the proving it impossible in every particular sense that either you or any one else understands it in?**

***Hyl*. But I am not so thoroughly satisfied that you have proved the impossibility of Matter, in the last most obscure abstracted and indefinite sense.**

***Phil*.. When is a thing shewn to be impossible?**

***Hyl*. When a repugnancy is demonstrated between the ideas comprehended in its definition.**

***Phil*. But where there are no ideas, there no repugnancy can be demonstrated between ideas?**

***Hyl*. I agree with you.**

***Phil*. Now, in that which you call the obscure indefinite sense of the word *Matter*, it is plain, by your own confession, there {226} was included no idea at all, no sense except an unknown sense; which is the same thing as none. You are not, therefore, to expect I should prove a repugnancy between ideas, where there are no ideas; or the impossibility of Matter taken in an *unknown* sense, that is, no sense at all. My business was only to shew you meant *nothing*; and this you were brought to own. So that, in all your various senses, you have been shewed either to mean nothing at all, or, if anything, an absurdity. And if this be not sufficient to prove the impossibility of a thing, I desire you will let me know what is.**

***Hyl*. I acknowledge you have proved that Matter is impossible; nor do I see what more can be said in defence of it. But, at the same time that I give up this, I suspect all my other notions. For surely none could be more seemingly evident than this once was: and yet it now seems as false and absurd as ever it did true before. But I think we have discussed the point sufficiently for the present. The remaining part of the day I would willingly spend in running over in my thoughts the several heads of this morning's conversation, and tomorrow shall be glad to meet you here again about the same time.**

***Phil*. *I* will not fail to attend you. {227}**

The Third Dialogue

Philonous. Tell me, Hylas,[7] what are the fruits of yesterday's meditation? Has it confirmed you in the same mind you were in at parting? or have you since seen cause to change your opinion?

Hylas. Truly my opinion is that all our opinions are alike vain and uncertain. What we approve to-day, we condemn to-morrow. We keep a stir about knowledge, and spend our lives in the pursuit of it, when, alas I we know nothing all the while: nor do I think it possible for us ever to know anything in this life. Our faculties are too narrow and too few. Nature certainly never intended us for speculation.

Phil. What! Say you we can know nothing, Hylas?

Hyl. There is not that single thing in the world whereof we can know the real nature, or what it is in itself.

Phil. Will you tell me I do not really know what fire or water is?

Hyl. You may indeed know that fire appears hot, and water fluid; but this is no more than knowing what sensations are produced in your own mind, upon the application of fire and water to your organs of sense. Their internal constitution, their true and real nature, you are utterly in the dark as to *that*.

Phil. Do I not know this to be a real stone that I stand on, and that which I see before my eyes to be a real tree?

Hyl. *Know*? No, it is impossible you or any man alive should know it. All you know is, that you have such a certain idea or appearance in your own mind. But what is this to the real tree or stone? I tell you that colour, figure, and hardness, which you perceive, are not the real natures of those things, or in the least like them. The same may be said of all other real things, or corporeal substances, which compose the world. They have none of them anything of themselves, like those sensible qualities by us perceived. We should not therefore pretend to affirm or know anything of them, as they are in their own nature.

Phil. But surely, Hylas, I can distinguish gold, for example, {228} from iron: and how could this be, if I knew not what either truly was?

Hyl. Believe me, Philonous, you can only distinguish between your own ideas. That yellowness, that weight, and other sensible qualities, think you they are really in the gold? They are only relative to the senses, and have no absolute existence in nature. And in pretending to distinguish the species of real things, by the appearances in your mind, you may perhaps act as wisely as he that should conclude two men were of a different species, because their clothes were not of the same colour.

Phil. It seems, then, we are altogether put off with the appearances of things, and those false ones too. The very meat I eat, and the cloth I wear, have nothing in them like what I see and feel.

Hyl. Even so.

Phil. But is it not strange the whole world should be thus imposed on, and so foolish as to believe their senses? And yet I know not how it is, but men eat, and drink, and sleep, and perform all the offices of life, as comfortably and conveniently as if they really knew the things they are conversant about.

Hyl. They do so: but you know ordinary practice does not require a nicety of speculative knowledge. Hence the vulgar retain their mistakes, and for all that make a shift to bustle through the affairs of life. But philosophers know better things.

Phil. You mean, they *know* that they *know nothing*.

Hyl. That is the very top and perfection of human knowledge.

Phil. But are you all this while in earnest, Hylas; and are you seriously persuaded that you know nothing real in the world? Suppose you are going to write, would you not call for pen, ink, and paper, like another man; and do you not know what it is you call for?

Hyl. How often must I tell you, that I know not the real nature of any one thing in the universe? I may indeed upon occasion make use of pen, ink, and paper. But what any one of them is in its own true nature, I declare positively I know not. And the same is true with regard to every, other corporeal thing. And, what is more, we are not only ignorant of the true and real nature of things, but even of their existence. It cannot be denied that we perceive such certain appearances or ideas; but it cannot be concluded from thence that bodies really exist. {229} Nay, now I think on it, I must, agreeably to my former concessions, farther declare that it is impossible any *real* corporeal thing should exist in nature.

Phil. You amaze me. Was ever anything more wild and extravagant than the notions you now maintain: and is it not evident you are led into all these extravagances by the belief of *material substance*? This makes you dream of those unknown natures in everything. It is this occasions your distinguishing between the reality and sensible appearances of things. It is to this you are indebted for being ignorant of what everybody else knows perfectly well. Nor is this all: you are not only ignorant of the true nature of everything, but you know not whether anything really exists, or whether there are any true natures at all; forasmuch as you attribute to your material beings an absolute or external existence, wherein you suppose their reality consists. And, as you are forced in the end to acknowledge such an existence means either a direct repugnancy, or nothing at all, it follows that you are obliged to pull down your own hypothesis of material Substance, and positively to deny the real existence of any part of the universe. And so you are plunged into the deepest and most deplorable scepticism that ever man was. Tell me, Hylas, is it not as I say?

Hyl. I agree with you. *Material substance* was no more than an hypothesis; and a false and groundless one too. I will no longer spend my breath in defence of it. But whatever hypothesis you advance, or whatsoever scheme of things you introduce in its stead, I doubt not it will appear every whit as false: let me but be allowed to question you upon it. That is, suffer me to serve you in your own kind, and I warrant it shall conduct you through as many perplexities and contradictions, to the very same state of scepticism that I myself am in at present.

Phil. I assure you, Hylas, I do not pretend to frame any hypothesis at all. I am of a vulgar cast, simple enough to believe my senses, and leave things as I find them. To be plain, it is my opinion that the real things are those very things I see, and feel, and perceive by my senses. These I know; and, finding they answer all the necessities and purposes of life, have no reason to be solicitous about any other unknown beings. A piece of sensible bread, for instance, would stay my stomach better than ten thousand times as much of that insensible, unintelligible, real bread you speak of. It is likewise my opinion that colours and other sensible qualities are on the {230} objects. I cannot for my life help thinking that snow is white, and fire hot. You indeed, who by *snow* and fire mean certain external, unperceived, unperceiving substances, are in the right to deny whiteness or heat to be affections inherent in *them*. But I, who understand by those words the things I see and feel,

am obliged to think like other folks. And, as I am no sceptic with regard to the nature of things, so neither am I as to their existence. That a thing should be really perceived by my senses, and at the same time not really exist, is to me a plain contradiction; since I cannot prescind or abstract, even in thought, the existence of a sensible thing from its being perceived. Wood, stones, fire, water, flesh, iron, and the like things, which I name and discourse of, are things that I know. And I should not have known them but that I perceived them by my senses; and things perceived by the senses are immediately perceived; and things immediately perceived are ideas; and ideas cannot exist without the mind; their existence therefore consists in being perceived; when, therefore, they are actually perceived there can be no doubt of their existence. Away then with all that scepticism, all those ridiculous philosophical doubts. What a jest is it for a philosopher to question the existence of sensible things, till he hath it proved to him from the veracity of God; or to pretend our knowledge in this point falls short of intuition or demonstration! I might as well doubt of my own being, as of the being of those things I actually see and feel.

***Hyl*. Not so fast, Philonous: you say you cannot conceive how sensible things should exist without the mind. Do you not?**

***Phil*. I do.**

***Hyl*. Supposing you were annihilated, cannot you conceive it possible that things perceivable by sense may still exist?**

***Phil*. *I* can; but then it must be in another mind. When I deny sensible things an existence out of the mind, I do not mean my mind in particular, but all minds. Now, it is plain they have an existence exterior to my mind; since I find them by experience to be independent of it. There is therefore some other Mind wherein they exist, during the intervals between the times of {231} my perceiving them: as likewise they did before my birth, and would do after my supposed annihilation. And, as the same is true with regard to all other finite created spirits, it necessarily follows there is an *omnipresent eternal Mind*, which knows and comprehends all things, and exhibits them to our view in such a manner, and according to such rules, as He Himself hath ordained, and are by us termed the *laws of nature*.**

***Hyl*. Answer me, Philonous. Are all our ideas perfectly inert beings? Or have they any agency included in them?**

***Phil*. They are altogether passive and inert.**

***Hyl*. And is not God an agent, a being purely active?**

***Phil*. I acknowledge it.**

***Hyl*. No idea therefore can be like unto, or represent the nature of God?**

***Phil*. It cannot.**

***Hyl*. Since therefore you have no *idea* of the mind of God, how can you conceive it possible that things should exist in His mind? Or, if you can conceive the mind of God, without having an idea of it, why may not I be allowed to conceive the existence of Matter, notwithstanding I have no idea of it?**

***Phil*. As to your first question: I own I have properly no *idea*, either of God or any other spirit; for these being active, cannot be represented by things perfectly inert, as our ideas are. I do nevertheless know that 1, who am a spirit or thinking substance, exist as certainly a s I know my ideas exist. Farther, I know what I mean by the terms I *and myself*; and I know this immediately or intuitively, though I do not perceive it as I perceive a triangle, a colour, or a sound. The Mind,**

Spirit, or Soul is that indivisible unextended thing which thinks, acts, and perceives. I say *indivisible*, because unextended; and *unextended*, because extended, figured, moveable things are ideas; and that which perceives ideas, which thinks and wills, is plainly itself no idea, nor like an idea. Ideas are things inactive, and perceived. And Spirits a sort of beings altogether different from them. I do not therefore say my soul is an idea, or like an idea. However, taking the word *idea* in a large sense, my soul may be said to furnish me with an idea, that is, an image or likeness of God -- though indeed extremely inadequate. For, all the notion I have of God is obtained by reflecting on my own soul, heightening its powers, and removing its {232} imperfections. I have, therefore, though not an inactive idea, yet in *myself* some sort of an active thinking image of the Deity. And, though I perceive Him not by sense, yet I have a notion of Him, or know Him by reflexion and reasoning. My own mind and my own ideas I have an immediate knowledge of; and, by the help of these, do mediately apprehend the possibility of the existence of other spirits and ideas. Farther, from my own being, and from the dependency I find in myself and my ideas, I do, by an act of reason, necessarily infer the existence of a God, and of all created things in the mind of God. So much for your first question. For the second: I suppose by this time you can answer it yourself. For you neither perceive Matter objectively, as you do an inactive being or idea; nor know it, as you do yourself, by a reflex act, neither do you mediately apprehend it by similitude of the one or the other; nor yet collect it by reasoning from that which you know immediately. All which makes the case of *Matter* widely different from that of the *Deity*.

[*Hyl*. You say your own soul supplies you with some sort of an idea or image of God. But, at the same time, you acknowledge you have, properly speaking, no *idea* of your own soul. You even affirm that spirits are a sort of beings altogether different from ideas. Consequently that no idea can be like a spirit. We have therefore no idea of any spirit. You admit nevertheless that there is spiritual Substance, although you have no idea of it; while you deny there can be such a thing as material Substance, because you have no notion or idea of it. Is this fair dealing? To act consistently, you must either admit Matter or reject Spirit. What say you to this?

Phil. *I* say, in the first place, that I do not deny the existence of material substance, merely because I have no notion of it' but because the notion of it is inconsistent; or, in other words, because it is repugnant that there should be a notion of it. Many things, for aught I know, may exist, whereof neither I nor any other man hath or can have any idea or notion whatsoever. But then those things must be possible, that is, nothing {233} inconsistent must be included in their definition. I say, secondly, that, although we believe things to exist which we do not perceive, yet we may not believe that any particular thing exists, without some reason for such belief: but I have no reason for believing the existence of Matter. I have no immediate intuition thereof: neither can I immediately from my sensations, ideas, notions, actions, or passions, infer an unthinking, unperceiving, inactive Substance -- either by probable deduction, or necessary consequence. Whereas the being of my Self, that is, my own soul, mind, or thinking principle, I evidently know by reflexion. You will forgive me if I repeat the same things in answer to the same objections. In the very notion or definition of *material Substance*, there is included a manifest repugnance and inconsistency. But this cannot be said of the notion of Spirit. That ideas should exist in what doth not perceive, or be produced by what doth not act, is repugnant. But, it is no repugnancy to say that a perceiving thing should be the subject of ideas, or an active thing the cause of them. It is granted we have neither an immediate evidence nor a demonstrative knowledge of the existence of other finite spirits; but it will not thence follow that such spirits are on a foot with material substances: if to suppose the one be inconsistent, and it be not inconsistent to suppose the other; if the one can be inferred by no

argument, and there is a probability for the other; if we see signs and effects indicating distinct finite agents like ourselves, and see no sign or symptom whatever that leads to a rational belief of Matter. I say, lastly, that I have a notion of Spirit, though I have not, strictly speaking, an idea of it. I do not perceive it as an idea, or by means of an idea, but know it by reflexion.

***Hyl*. Notwithstanding all you have said, to me it seems that, according to your own way of thinking, and in consequence of your own principles, it should follow that *you* are only a system of floating ideas, without any substance to support them. Words are not to be used without a meaning. And, as there is no more meaning in *spiritual Substance* than in *material Substance*, the one is to be exploded as well as the other.**

***Phil*. How often must I repeat, that I know or am conscious of my own being; and that *I myself* am not my ideas, but somewhat else, a thinking, active principle that perceives, knows, wifls, and operates about ideas. I know that I, one {234} and the same self, perceive both colours and sounds: that a colour cannot perceive a sound, nor a sound a colour: that I am therefore one individual principle, distinct from colour and sound; and, for the same reason, from aft other sensible things and inert ideas. But, I am not in like manner conscious either of the existence or essence of Matter. On the contrary, I know that nothing inconsistent can exist, and that the existence of Matter implies an inconsistency. Farther, I know what I mean when I affirm that there is a spiritual substance or support of ideas, that is, that a spirit knows and perceives ideas. But, I do not know what is meant when it is said that an unperceiving substance hath inherent in it and supports either ideas or the archetypes of ideas. There is therefore upon the whole no parity of case between Spirit and Matter.][8]**

***Hyl*. I own myself satisfied in this point. But, do you in earnest think the real existence of sensible things consists in their being actually perceived? If so; how comes it that all mankind distinguish between them? Ask the first man you meet, and he shall tell you, *to be perceived* is one thing, and *to exist* is another.**

***Phil*. *I* am content, Hylas, to appeal to the common sense of the world for the truth of my notion. Ask the gardener why he thinks yonder cherry-tree exists in the garden, and he shall tell you, because he sees and feels it; in a word, because he perceives it by his senses. Ask him why he thinks an orange-tree not to be there, and he shall tell you, because he does not perceive it. What he perceives by sense, that he terms a real, being, and saith it *is or exists*; but, that which is not perceivable, the same, he saith, hath no being.**

***Hyl*. Yes, Philonous, I grant the existence of a sensible thing consists in being perceivable, but not in being actually perceived.**

***Phil*. And what is perceivable but an idea? And can an idea exist without being actually perceived? These are points long since agreed between us.**

***Hyl*. But, be your opinion never so true, yet surely you will not deny it is shocking, and contrary to the common sense of men. {235} Ask the fellow whether yonder tree hath an existence out of his mind: what answer think you he would make?**

***Phil*. The same that I should myself, to wit, that it doth exist out of his mind. But then to a Christian it cannot surely be shocking to say, the real tree, existing without his mind, is truly known and comprehended by (that is *exists in*) the infinite mind of God. Probably he may not at first glance be aware of the direct and immediate proof there is of this; inasmuch as the very being of a tree, or any other sensible thing, implies a mind wherein it is. But the point itself he cannot**

deny. The question between the Materialists and me is not, whether things have a *real* existence out of the mind of this or that person, but whether they have an *absolute* existence, distinct from being perceived by God, and exterior to all minds. This indeed some heathens and philosophers have affirmed, but whoever entertains notions of the Deity suitable to the Holy Scriptures will be of another opinion.

Hyl. But, according to your notions, what difference is there between real things, and chimeras formed by the imagination, or the visions of a dream -- since they are all equally in the mind?

Phil. The ideas formed by the imagination are faint and indistinct; they have, besides, an entire dependence on the will. But the ideas perceived by sense, that is, real things, are more vivid and clear; and, being imprinted on the mind by a spirit distinct from us, have not the like dependence on our will. There is therefore no danger of confounding these with the foregoing: and there is as little of confounding them with the visions of a dream, which are dim, irregular, and confused. And, though they should happen to be never so lively and natural, yet, by their not being connected, and of a piece with the preceding and subsequent transactions of our lives, they might easily be distinguished from realities. In short, by whatever method you distinguish *things from chimeras* on your scheme, the same, it is evident, will hold also upon mine. For, it must be, I presume, by some perceived difference; and I am not for depriving you of any one thing that you perceive.

Hyl. But still, Philonous, you hold, there is nothing in the world but spirits and ideas. And this, you must needs acknowledge, sounds very oddly.

Phil. I own the word *idea,* not being commonly used for *thing,* sounds something out of the way. My reason for using it was, because a necessary relation to the mind is understood to {236} be implied by that term; and it is now commonly used by philosophers to denote the immediate objects of the understanding. But, however oddly the proposition may sound in words, yet it includes nothing so very strange or shocking in its sense; which in effect amounts to no more than this, to wit, that there are only things perceiving, and things perceived; or that every unthinking being is necessarily, and from -the very nature of its existence, perceived by some mind; if not by a finite created mind, yet certainly by the infinite mind of God, in whom "we five, and move, and have our being." Is this as strange as to say, the sensible qualities are not on the objects: or that we cannot be sure of the existence of things, or know any thing of their real natures -- though we both see and feel them, and perceive them by all our senses?

Hyl. And, in consequence of this, must we not think there are no such things as physical or corporeal causes; but that a Spirit is the immediate cause of all the phenomena in nature? Can there be anything more extravagant than this?

Phil. Yes, it is infinitely more extravagant to say -- a thing which is inert operates on the mind, and which is unperceiving is the cause of our perceptions, [without any regard either to consistency, or the old known axiom, *Nothing can give to another that which it hath not itself*].[9] Besides, that which to you, I know not for what reason, seems so extravagant is no more than the Holy Scriptures assert in a hundred places. In them God is represented as the sole and immediate Author of all those effects which some heathens and philosophers are wont to ascribe to Nature, Matter, Fate, or the like unthinking principle. This is so much the constant language of Scripture that it were needless to confirm it by citations.

Hyl. You are not aware, Philonous, that in making God the immediate Author of all the motions in nature, you make Him the Author of murder, sacrilege, adultery, and the like heinous sins.

***Phil*. In answer to that, I observe, first, that the imputation of guilt is the same, whether a person commits an action with or without an instrument. In case therefore you suppose God to act by the mediation of an instrument or occasion, called *Matter*, you as truly make Him the author of sin as I, who think Him the immediate agent in all those operations vulgarly ascribed to Nature. I farther observe that sin or moral turpitude {237} doth not consist in the outward physical action or motion, but in the internal deviation of the will from the laws of reason and religion. This is plain, in that the killing an enemy in a battle, or putting a criminal legally to death, is not thought sinful; though the outward act be the very same with that in the case of murder. Since, therefore, sin doth not consist in the physical action, the making God an immediate cause of all such actions is not making Him the Author of sin. Lastly, I have nowhere said that God is the only agent who produces all the motions in bodies. It is true I have denied there are any other agents besides spirits; but this is very consistent with allowing to thinking rational beings, in the production of motions, the use of limited powers, ultimately indeed derived from God, but immediately under the direction of their own wills, which is sufficient to entitle them to all the guilt of their actions.**

***Hyl*. But the denying Matter, Philonous, or corporeal Substance; there is the point. You can never persuade me that this is not repugnant to the universal sense of mankind. Were our dispute to be determined by most voices, I am confident you would give up the point, without gathering the votes.**

***Phil*. I wish both our opinions were fairly stated and submitted to the judgment of men who had plain common sense, without the prejudices of a learned education. Let me be represented as one who trusts his senses, who thinks he knows the things he sees and feels, and entertains no doubts of their existence; and you fairly set forth with all your doubts, your paradoxes, and your scepticism about you, and I shall willingly acquiesce in the determination of any indifferent person. That there is no substance wherein ideas can exist beside spirit is to me evident. And that the objects immediately perceived are ideas, is on all hands agreed. And that sensible qualities are objects immediately perceived no one can deny. It is therefore evident there can be no *substratum* of those qualities but spirit; in which they exist, not by way of mode or property, but as a thing perceived in that which perceives it. I deny therefore that there is *any unthinking-substratum* of the objects of sense, and *in that acceptation* that there is any material substance. But if by *material substance* is meant only *sensible body*, *that* which is seen and felt (and the unphilosophical part of the world, I dare say, mean no more) -- then I am more certain of matter's existence than you or any other philosopher pretend to be. If there be anything which makes ,die generality of mankind {238} averse from the notions I espouse, it is a misapprehension that I deny the reality of sensible things. But, as it is you who are guilty of that, and not 1, it follows that in truth their aversion is against your notions and not mine. I do therefore assert that I am as certain as of my own being, that there are bodies or corporeal substances (meaning the things I perceive by my senses); and that, granting this, the bulk of mankind will take no thought about, nor think themselves at all concerned in the fate of those unknown natures, and philosophical quiddities, which some men are so fond of.**

***Hyl*. What say you to this? Since, according to you, men judge of the reality of things by their senses, how can a man be mistaken in thinking the moon a plain lucid surface, about a foot in diameter; or a square tower, seen at a distance, round; or an oar, with one end in the water, crooked?**

***Phil*. He is not mistaken with regard to the ideas he actually perceives, but in the inference he makes from his present perceptions. Thus, in the case of the oar, what he immediately perceives by**

sight is certainly crooked; and so far he is in the right. But if he thence conclude that upon taking the oar out of the water he shall perceive the same crookedness; or that it would affect his touch as crooked things are wont to do: in that he is mistaken. In like manner, if he shall conclude from what he perceives in one station, that, in case he advances towards the moon or tower, he should still be affected with the like ideas, he is mistaken. But his mistake lies not in what he perceives immediately, and at present, (it being a manifest contradiction to suppose he should err in respect of that) but in the wrong judgment he makes concerning the ideas he apprehends to be connected with those immediately perceived: or, concerning the ideas that, from what he perceives at present, he imagines would be perceived in other circumstances. The case is the same with regard to the Copernican system. We do not here perceive any motion of the earth: but it were erroneous thence to conclude, that, in case we were placed at as great a distance from that as we are now from the other planets, we should not then perceive its motion.

Hyl. I understand you; and must needs own you say things plausible enough. But, give me leave to put you in mind of {239} one thing. Pray, Philonous, were you not formerly as positive that Matter existed, as you are now that it does not?

Phil. I was. But here lies the difference. Before, my positiveness was founded, without examination, upon prejudice; but now, after inquiry, upon evidence.

Hyl. After all, it seems our dispute is rather about words than things. We agree in the thing, but differ in the name. That we are affected with ideas *from without* is evident; and it is no less evident that there must be (I will not say archetypes, but) Powers without the mind, corresponding to those ideas. And, as these Powers cannot subsist by themselves, there is some subject of them necessarily to be admitted; which I call *Matter*, and you call *Spirit*. This is all the difference.

Phil. Pray, Hylas, is that powerful Being, or subject of powers, extended?

Hyl. It hath not extension; but it hath the power to raise in you the idea of extension.

Phil. It is therefore itself unextended?

Hyl. I grant it.

Phil. Is it not also active?

Hyl. Without doubt. Otherwise, how could we attribute powers to it?

Phil. Now let me ask you two questions: *First*, Whether it be agreeable to the usage either of philosophers or others to give the name *Matter* to an unextended active being? And, *Secondly*, Whether it be not ridiculously absurd to misapply names contrary to the common use of language?

Hyl. Well then, let it not be called Matter, since you will have it so, but some *Third Nature* distinct from Matter and Spirit. For what reason is there why you should call it Spirit? Does not the notion of spirit imply that it is thinking, as well as active and unextended?

Phil. My reason is this: because I have a mind to have some notion of meaning in what I say: but I have no notion of any action distinct from volition, neither. can I conceive volition to be anywhere but in a spirit: therefore, when I speak of an active being, I am obliged to mean a Spirit. Beside, what can be plainer than that a thing which hath no ideas in itself cannot impart them to me; and, if it hath ideas, surely it must be a Spirit. To make you comprehend the point still more {240} clearly if it be possible, I assert as well as you that, since we are affected from without, we must allow Powers to be without, in a Being distinct from ourselves. So far we are agreed. But then we differ as to the kind of this powerful Being. I will have it to be Spirit, you Matter, or I know not what (I may add too, you know not what) Third Nature. Thus, I prove it to be Spirit. From the

effects I see produced, I conclude there are actions; and, because actions, volitions; and, because there are volitions, there must be a *will*. Again, the things I perceive must have an existence, they or their archetypes, out of *my* mind: but, being ideas, neither they nor their archetypes can exist otherwise than in an understanding; there is therefore an *understanding*. But will and understanding constitute in the strictest sense a mind or spirit. The powerful cause, therefore, of my ideas is in strict propriety of speech a *Spirit*.

***Hyl*. And now I warrant you think you have made the point very clear, little suspecting that what you advance leads directly to a contradiction. Is it not an absurdity to imagine any imperfection in God?**

***Phil*. Without a doubt.**

***Hyl*. To suffer pain is an imperfection?**

***Phil*. It is.**

***Hyl*. Are we not sometimes affected with pain and uneasiness by some other Being?**

***Phil*. We are.**

***Hyl*. And have you not said that Being is a Spirit, and is not that Spirit God?**

***Phil*. I grant it.**

***Hyl*. But you have asserted that whatever ideas we perceive from without are in the mind which affects us. The ideas, therefore, of pain and uneasiness are in God; or, in other words, God suffers pain: that is to say, there is an imperfection in the Divine nature: which, you acknowledged, was absurd. So you are caught in a plain contradiction.**

***Phil*. That God knows or understands all things, and that He knows, among other things, what pain is, even every sort of painful sensation, and what it is for His creatures to suffer pain, I make no question. But, that God, though He knows and sometimes causes painful sensations in us, can Himself suffer pain, I positively deny. We, who are limited and dependent spirits, are liable to impressions of sense, the effects of an {241} external Agent, which, being produced against our wills, are sometimes painful and uneasy. But God, whom no external being can affect, who perceives nothing by sense as we do; whose will is absolute and independent, causing all things, and liable to be thwarted or resisted by nothing: it is evident, such a Being as this can suffer nothing, nor be affected with any painful sensation, or indeed any sensation at all. We are chained to a body: that is to say, our perceptions are connected with corporeal motions. By the law of our nature, we are affected upon every alteration in the nervous parts of our sensible body; which sensible body, rightly considered, is nothing but a complexion of such qualities or ideas as have no existence distinct from being perceived by a mind. So that this connexion of sensations with corporeal motions means no more than a correspondence in the order of nature, between two sets of ideas, or things immediately perceivable. But God is a Pure Spirit, disengaged from all such sympathy, or natural ties. No corporeal motions are attended with the sensations of pain or pleasure in His mind. To know everything knowable, is certainly a perfection; but to endure, or suffer, or feel anything by sense, is an imperfection. The former, I say, agrees to God, but not the latter. God knows, or hath ideas; but His ideas are not conveyed to Him by sense, as ours are. Your not distinguishing, where there is so manifest a difference, makes you fancy you see an absurdity where there is none.**

***Hyl*. But, all this while you have not considered that the quantity of Matter has been demonstrated to be proportioned to the gravity of bodies. And what can withstand demonstration?**

***Phil*. Let me see how you demonstrate that point.**

***Hyl*. I lay it down for a principle, that the moments or quantities of motion in bodies are in a direct compounded reason of the velocities and quantities of Matter contained in them. Hence, where the velocities are equal, it follows the moments are directly as the quantity of Matter in each. But it is found by experience that all bodies (bating the small inequalities, arising from the resistance of the air) descend with an equal velocity; the motion therefore of descending bodies, and consequently their gravity, which is the cause or principle of that motion, is proportional to the quantity of Matter; which was to be demonstrated.**

***Phil*. You lay it down as a self-evident principle that the quantity of motion in any body is proportional to the velocity {242} and *Matter* taken together; and this is made use of to prove a proposition from whence the existence of *Carter* is inferred. Pray is not this arguing in a circle?**

***Hyl*. In the premise I only mean that the motion is proportional to the velocity, jointly with the extension and solidity.**

***Phil*. But, allowing this to be true, yet it will not thence follow that gravity is proportional to *Matter*, in your philosophic sense of the word; except you take it for granted that unknown *substratum*, or whatever else you call it, is proportional to those sensible qualities; which to suppose is plainly begging the question. That there is magnitude and solidity, or resistance, perceived by sense, I readily grant; as likewise, that gravity may be proportional to those qualities I will not dispute. But that either these qualities as perceived by us, or the powers producing them, do exist in a *material substratum*; this is what I deny, and you indeed affirm, but, notwithstanding your demonstration, have not yet proved.**

***Hyl*. I shall insist no longer on that point. Do you think, however, you shall persuade me that the natural philosophers have been dreaming all this while? Pray what becomes of all their hypotheses and explications of the phenomena, which suppose the existence of Matter?**

***Phil*. What mean you, Hylas, by the *phenomena*?**

***Hyl*. I mean the appearances which I perceive by my senses.**

***Phil*. And the appearances perceived by sense, are they not ideas?**

***Hyl*. I have told you so a hundred times.**

***Phil*. Therefore, to explain the phenomena, is, to shew how we come to be affected with ideas, in that manner and order wherein they are imprinted on our senses. Is it not?**

***Hyl*. It is.**

***Phil*. Now, if you can prove that any philosopher has explained the production of any one idea in our minds by the help of *Matter*, I shall for ever acquiesce, and look on all that hath been said against it as nothing; but, if you cannot, it is vain to urge the explication of phenomena. That a Being endowed with knowledge and will should produce or exhibit ideas is easily understood. But that a Being which is utterly destitute of these faculties should be able to produce ideas, or in any sort to affect an intelligence, this I can never understand. This I say, though {243} we had some positive conception of Matter, though we knew its qualities, and could comprehend its existence, would yet be so far from explaining things, that it is itself the most inexplicable thing in the world. And yet, for all this, it will not follow that philosophers have been doing nothing; for, by observing and reasoning upon the connexion of ideas, they discover the laws and methods of nature, which is a part of knowledge both useful and entertaining.**

Hyl. After all, can it be supposed God would deceive all mankind? Do you imagine He would have induced the whole world to believe the being of Matter, if there was no such thing?

Phil. That every epidemical opinion, arising from prejudice, or passion, or thoughtlessness, may be imputed to God, as the Author of it, I believe you will not affirm. Whatsoever opinion we father ' on Him, it must be either because He has discovered it to us by supernatural revelation; or because it is so evident to our natural faculties, which were framed and given us by God, that it is impossible we should withhold our assent from it. But where is the revelation? or where is the evidence that extorts the belief of Matter? Nay, how does it appear, that Matter, *taken for something distinct from what we perceive by our senses*, is thought to exist by all mankind; or indeed, by any except a few philosophers, who do not know what they would be at? Your question supposes these points are clear; and, when you have cleared them, I shall think myself obliged to give you another answer. In the meantime, let it suffice that I tell you, I do not suppose God has deceived mankind at all.

Hyl. But the novelty, Philonous, the novelty! There lies the danger. New notions should always be discountenanced; they unsettle men's minds, and nobody knows where they will end.

Phil. Why the rejecting a notion that has no foundation, either in sense, or in reason, or in Divine authority, should be thought to unsettle the belief of such opinions as are grounded on all or any of these, I cannot imagine. That innovations in government and religion are dangerous, and ought to be discountenanced, I freely own. But is there the like reason why they should be discouraged in philosophy? The making anything known which was unknown before is an innovation in knowledge: and, if all such innovations had been forbidden, {244} men would have made a notable progress in the arts and sciences. But it is none of my business to plead for novelties and paradoxes. That the qualities we perceive are not on the objects: that we must not believe our senses: that we know nothing of the real nature of things, and can never be assured even of their existence: that real colours and sounds are nothing but certain unknown figures and motions: that motions are in themselves neither swift nor slow: that there are in bodies absolute extensions, without any particular magnitude or figure: that a thing stupid, thoughtless, and inactive, operates on a spirit: that the least particle of a body contains innumerable extended parts: -- these are the novelties, these are the strange notions which shock the genuine uncorrupted judgment of all mankind; and being once admitted, embarrass the mind with endless doubts and difficulties. And it is against these and the like innovations I endeavour to vindicate Common Sense. It is true, in doing this, I may perhaps be obliged to use some *ambages*, and ways of speech not common. But, if my notions are once thoroughly understood, that which is most singular in them will, in effect, be found to amount to no more than this. -- that it is absolutely impossible, and a plain contradiction, to suppose any unthinking Being should exist without being perceived by a Mind. And, if this notion be singular, it is a shame it should be so, at this time of day, and in a Christian country.

Hyl. As for the difficulties other opinions may be liable to,. those are out of the question. It is your business to defend your own opinion. Can anything be plainer than that you are for changing all things into ideas? You, I say, who are not ashamed to charge me *with scepticism*. This is so plain, there is no denying it.

Phil. You mistake me. I am not for changing things into ideas, but rather ideas into things; since those immediate objects of perception, which, according to you, are only appearances of things, I take to be the real things themselves.

Hyl. Things! You may pretend what you please; but it is certain you leave us nothing but the empty

forms of things, the outside only which strikes the senses.

***Phil*. What you call the empty forms and outside of things seem to me the very things themselves. Nor are they empty or incomplete, otherwise than upon your supposition -- that Matter {245} is an essential part of all corporeal things. We both, therefore, agree in this, that we perceive only sensible forms: but herein we differ -- you will have them to be empty appearances, I, real beings. In short, you do not trust your senses, I do.**

***Hyl*. You say you believe your senses; and seem to applaud yourself that in this you agree with the vulgar. According to you, therefore, the true nature of a thing is discovered by the senses. If so, whence comes that disagreement? Why is not the same figure, and other sensible qualities, perceived all manner of ways? and why should we use a microscope the better to discover the true nature of a body, if it were discoverable to the naked eye?**

***Phil*. Strictly speaking, Hylas, we do not see the same object that we feel; neither is the same object perceived by the microscope which was by the naked eye. But, in case every variation was thought sufficient to constitute a new kind of individual, the endless number of confusion of names would render language impracticable. Therefore, to avoid this, as well as other inconveniences which are obvious upon a little thought, men combine together several ideas, apprehended by divers senses, or by the same sense at different times, or in different circumstances, but observed, however, to have some connexion in nature, either with respect to co-existence or succession; all which they refer to one name, and consider as one thing. Hence it follows that when I examine, by my other senses, a thing I have seen, it is not in order to understand better the same object which I had perceived by sight, the object of one sense not being perceived by the other senses. And, when I look through a microscope, it is not that I may perceive more clearly what I perceived already with my bare eyes; the object perceived by the glass being quite different from the former. But, in both cases, my aim is only to know what ideas are connected together; and the more a man knows of the connexion of ideas, the more he is said to know of the nature of things. What, therefore, if our ideas are variable; what if our senses are not in all circumstances affected with the same appearances. It will not thence follow they are not to be trusted; or that they are inconsistent either with themselves or anything else: except it be with your preconceived notion of (I know not what) one single, unchanged, unperceivable, real Nature, marked by each name. Which prejudice seems to have taken its rise from not rightly {246} understanding the common language of men, speaking of several distinct ideas as united into one thing by the mind. And, indeed, there is cause to suspect several erroneous conceits of the philosophers are owing to the same original: while they began to build their schemes not so much on notions as on words, which were framed by the vulgar, merely for conveniency and dispatch in the common actions of life, without any regard to speculation.**

***Hyl*. Methinks I apprehend your meaning.**

***Phil*. It is your opinion the ideas we perceive by our senses are not real things, but images or copies of them. Our knowledge, therefore, is no farther real than as our ideas are the true *representations* of those *originals*. But, as these supposed originals are in themselves unknown, it is impossible to know how far our ideas resemble them; or whether they resemble them at all. We cannot, therefore, be sure we have any real knowledge. Farther, as our ideas are perpetually varied, without any change in the supposed real things, it necessarily follows they cannot all be true copies of them: or, if some are and others are not, it is impossible to distinguish the former from the latter. And this plunges us yet deeper in uncertainty. Again, when we consider the point, we cannot conceive how any idea, or anything like an idea, should have an absolute existence out of a mind:**

nor consequently, according to you, how there should be any real thing in nature. The result of ;all which is that we are thrown into the most hopeless and abandoned scepticism. Now, give me leave to ask you, First, Whether your referring ideas to certain absolutely existing unperceived substances, as their originals, be not the source of all this scepticism? Secondly, whether you are informed, either by sense or reason, of the existence of those unknown originals? And, in case you are not, whether it be not absurd to suppose them? Thirdly, Whether, upon inquiry, you find there is anything distinctly conceived or meant by the *absolute or external existence of unperceiving substances*? Lastly, Whether, the premises considered, it be not the wisest way to follow nature, trust your senses, and, laying aside all anxious thought about unknown natures or substances, admit with the vulgar those for real things which are perceived by the senses?

Hyl. For the present, I have no inclination to the answering part. I would much rather see how you can get over what follows. Pray are not the objects perceived by the {247} *senses* of one, likewise perceivable to others present? If there were a hundred more here, they would all see the garden, the trees, and flowers, as I see them. But they are not in the same manner affected with the ideas I frame in my *imagination*. Does not this make a difference between the former sort of objects and the latter?

Phil. I grant it does. Nor have I ever denied a difference between the objects of sense and those of imagination. But what would you infer from thence? You cannot say that sensible objects exist unperceived, because they are perceived by many.

Hyl. I own I can make nothing of that objection: but it hath led me into another. Is it not your opinion that by our senses we perceive only the ideas existing in our minds?

Phil. It is.

Hyl. But the *same* idea which is in my mind cannot be in yours, or in any other mind. Doth it not therefore follow, from your principles, that no two can see the same thing? And is not this highly, absurd?

Phil. If the term *same* be taken in the vulgar acceptation, it is certain (and not at all repugnant to the principles I maintain) that different persons may perceive the same thing; or the same thing or idea exist in different minds. Words are of arbitrary imposition; and, since men are used to apply the word *same* where no distinction or variety is perceived, and I do not pretend to alter their perceptions, it follows that, as men have said before, *several saw the same thing*, so they may, upon like occasions, still continue to use the same phrase, without any deviation either from propriety of language, or the truth of things. But, if the term *same* be used in the acceptation of philosophers, who pretend to an abstracted notion of identity, then, according to their sundry definitions of this notion (for it is not yet agreed wherein that philosophic identity consists), it may or may not be possible for divers persons to perceive the same thing. But whether philosophers shall think fit to *call* a thing the *same or* no, is, I conceive, of small importance. Let us suppose several men together, all endued with the same faculties, and consequently affected in like sort by their senses, and who had yet never known the use of language; they would, without question, agree in their perceptions. Though perhaps, when they came to the use of speech, some regarding the uniformness of what was perceived, might call it the *same* thing: others, especially {248} regarding the diversity of persons who perceived, might choose the denomination of *different* things. But who sees not that all the dispute is about a word? to wit, whether. what is perceived by different persons may yet have the term *same* applied to it? Or, suppose a house, whose walls or outward shell remaining unaltered, the chambers are all pulled down, and new ones built in their place; and that you should

call this the *same*, and I should say it was not the *same* house. -- would we not, for all this, perfectly agree in our thoughts of the house, considered in itself? And would not all the difference consist in a sound? If you should say, We differed in our notions; for that you super-added to your idea of the house the simple abstracted idea of identity, whereas I did not; I would tell you, I know not what you mean by *the abstracted idea of identity*; and should desire you to look into your own thoughts, and be sure you understood yourself. -- Why so silent, Hylas? Are you not yet satisfied men may dispute about identity and diversity, without any real difference in their thoughts and opinions, abstracted from names? Take this farther reflexion with you: that whether Matter be allowed to exist or no, the case is exactly the same as to the point in hand. For the Materialists themselves acknowledge what we immediately perceive by our senses to be our own ideas. Your difficulty, therefore, that no two see the same thing, makes equally against the Materialists and me.

Hyl. [Ay, Philonous,][10] But they suppose an external archetype, to which referring their several ideas they may truly be said to perceive the same thing.

Phil. And (not to mention your having discarded those archetypes) so may you suppose an external archetype on my principles; -- *external, I mean, to your own mind*: though indeed it must be' supposed to exist in that Mind which comprehends all things; but then, this serves all the ends of *identity*, as well as if it existed out of a mind. And I am sure you yourself will not say it is less intelligible.

Hyl. You have indeed clearly satisfied me -- either that there is no difficulty at bottom in this point; or, if there be, that it makes equally against both opinions.

Phil. But that which makes equally against two contradictory opinions can be a proof against neither.

Hyl. I acknowledge it. But, after all, Philonous, when I consider {249} the substance of what you advance against *Scepticism*, it amounts to no more than this: We are sure that we really see, hear, feel; in a word, that we are affected with sensible impressions.

Phil. And how are *we* concerned any farther? I see this cherry, I feel it, I taste it: and I am sure *nothing* cannot be seen, or felt, or. tasted: it is therefore red. Take away the sensations of softness, moisture, redness, tartness, and you take away the cherry, since it is not a being distinct from sensations. A cherry, I say, is nothing but a congeries of sensible impressions, or ideas perceived by various senses: which ideas are united into one thing (or have one name given them) by the mind, because they are observed to attend each other. Thus, when the palate is affected with such a particular taste, the sight is affected with a red colour, the touch with roundness, softness, &c. Hence, when I see, and feel, and taste, in such sundry certain manners, I am sure the cherry exists, or is real; its reality being in my opinion nothing abstracted from those sensations. But if by the word *cherry* you, mean an unknown nature, distinct from all those sensible qualities, and by its *existence* something distinct from its being perceived; then, indeed, I own, neither you nor I, nor any one else, can be sure it exists.

Hyl. But, what would you say, Philonous, if I should bring the very same reasons against the existence of sensible things *in a mind*, which you have offered against their existing *in a material substratum*?

Phil. When I see your reasons, you shall hear what I have to say ,to them.

Hyl. Is the mind extended or unextended?

Phil. Unextended, without doubt.

***Hyl*. Do you say the things you perceive are in your mind?**

***Phil*. They are.**

***Hyl*. Again, have I not heard you speak of sensible impressions?**

***Phil*. I believe you may.**

***Hyl*. Explain to me now, 0 Philonous! how it is possible there should be room for all those trees and houses to exist in your mind. Can extended things be contained in that which is unextended? Or, are we to imagine impressions made on a thing void of all solidity? You cannot say objects are in your mind, as books in your study: or that things are imprinted on it, as the figure of a seal upon wax. In what sense, therefore, are we to understand those expressions? Explain me this if you can: and I shall then be able to answer all those queries you formerly put to me about my *substratum*.**

***Phil*. Look you, Hylas, when I speak of objects as existing in the mind, or imprinted on the senses, I would not be understood in the gross literal sense; as when bodies are said to exist in a place, or a seal to make an impression upon wax. My meaning is only that the mind comprehends or perceives them; and that it is affected from without, or by some being distinct from itself. This is my explication of your difficulty; and how it can serve to make your tenet of an unperceiving material *substratum* intelligible, I would fain know.**

***Hyl*. Nay, if that be all, I confess I do not see what use can be made of it. But are you not guilty of some abuse of language in this?**

***Phil*. None at all. It is no more than common custom, which you know is the rule of language, hath authorised: nothing being more usual, than for philosophers to speak of the immediate objects of the understanding as things existing in the mind. 'Nor is there anything in this but what is conformable to the general analogy of language; most part of the mental operations being signified by words borrowed from sensible things; as is plain in the terms *comprehend*, reflect, *discourse*, &*c*., which, being applied to the mind, must not be taken in their gross, original sense.**

***Hyl*. You have, I own, satisfied me in this point. But there still remains one great difficulty, which I know not how you will get over. And, indeed, it is of such importance that if you could solve all others, without being able to find a solution for this, you must never expect to make me a proselyte to your principles.**

***Phil*. Let me know this mighty difficulty.**

***Hyl*. The Scripture account of the creation is what appears to me utterly irreconcilable with your notions. Moses tells us of a creation: a creation of what? of ideas? No, certainly, but of things, of real things, solid corporeal substances. Bring your principles to agree with this, and I shall perhaps agree with you.**

***Phil*. Moses mentions the sun, moon, and stars, earth and sea, plants and animals. That all these do really exist, and were in the beginning created by God, I make no question. {251} If by *ideas* you mean fictions and fancies of the mind, then these are no ideas. If by *ideas* you mean immediate objects of the understanding, or sensible things, which cannot exist unperceived, or out of a mind, then these things are ideas. But whether you do or do not call them *ideas, it* matters little. The difference is only about a name. And, whether that name be retained or rejected, the sense, the truth, and reality of things continues the same. In common talk, the objects of our senses are not termed *ideas*, but *things*. Call them so still: provided you do not attribute to them any absolute external existence, and I shall never quarrel with you for a word. The creation, therefore, I allow to have been a creation of things, of *red* things. Neither is this in the least inconsistent with my**

principles, as is evident from what I have now said; and would have been evident to you without this, if you had not forgotten what had been so often said before. But as for solid corporeal substances, I desire you to show where Moses makes any mention of them; and, if they should be mentioned by him, or any other inspired writer, it would still be incumbent on you to shew those words were not taken in the vulgar acceptation, for things falling under our senses, but in the philosophic acceptation, for Matter, or *an unknown quiddity, with an absolute existence*. When you have proved these points, then (and not till then) may you bring the authority of Moses into our dispute.

***Hyl*. It is in vain to dispute about a point so clear. I am content to refer it to your own conscience. Are you not satisfied there is some peculiar repugnancy between the Mosaic account of the creation and your notions?**

***Phil*. If all possible sense which can be put on the first chapter of Genesis may be conceived as consistently with my principles as any other, then it has no peculiar repugnancy with them. But there is no sense you may not as well conceive, believing as I do. Since, besides spirits, all you conceive are ideas; and the existence of these I do not deny. Neither do you pretend they exist without the mind.**

***Hyl*. Pray let me see any sense you can understand it in.**

***Phil*. Why, I imagine that if I had been present at the creation, I should have seen things produced into being -- that is become perceptible -- in the order prescribed by the sacred historian. I ever before believed the Mosaic account of the creation, and now find no alteration in my manner of believing it. When things are said to begin or end their existence, we {252} do not mean this with regard to God, but His creatures. All objects are eternally known by God, or, which is the same thing, have an eternal existence in His mind: but when things, before imperceptible to creatures, are, by a decree of God, perceptible to them, then are they said to begin a relative existence, with respect to created minds. Upon reading therefore the Mosaic account of the creation, I understand that the several parts of the world became gradually perceivable to finite spirits, endowed with proper faculties; so that, whoever such were present, they were in truth perceived by them. This is the literal obvious sense suggested to me by the words of the Holy Scripture: in which is included no mention, or no thought, either of *substratum*, *instrument, occasion,* or *absolute existence*. And, upon inquiry, I doubt not it will be found that most plain honest men, who believe the creation, never think of those things any more than I. What metaphysical sense you may understand it in, you only can tell.**

***Hyl*. But, Philonous, you do not seem to be aware that you allow created things, in the beginning, only a relative, and consequently hypothetical being: that is to say, upon supposition there were *men* to perceive them; without which they have no actuality of absolute existence, wherein creation might terminate. Is it not, therefore, according to you, plainly impossible the creation of any inanimate creatures should precede that of man? And is not this directly contrary to the Mosaic account?**
